A New Church at Waterford is being erected in connection with the Convent of the Good Shepherd there. The chapel will comprise nun's choir or nave, sanctuary and avant choir at the west end of nave, two side aisles (one for the accommodation of the penitents and the other for the children of the Industrial School under the charge of the nuns), and a Magdalen's choir and large sacristies for priests and nuns. The chapel will be connected with the convent and schools by cloisters on each side. The dimensions of the chapel will be—nave, 27ft. 6in. by 24ft. wide; patients' aisle and aisle for industrial school children, each 91ft. 6in. by 22ft. wide; sanctuary, 31ft. by 31ft.; Magdalen's choir, 25ft. by 18ft.; priests' sacristy, 20ft. 9in. by 19ft.; nuns' sacristy, 19ft. by 18ft. Messrs. John Hearne & Son, of Waterford, are the builders, and Mr. William Byrne, M.P.I.A., of 20, Suffolk Street, Dublin, is the architect.

Trade and Craft.

Gas Stoves.

With the improved construction consequent on long experience, gas stoves have outlived the reproach first applied to them that they were unhealthy, because they gave off injurious products and produced an unpleasant dryness in the air which they warmed. Yet, though necessary with the ordinary class of stoves, the ventilating flues sometimes entail considerable trouble and inconvenience in fixing; so that a stove which can do without a flue must possess a great advantage. Such a stove—the "Lux-Calor"—is made by Messrs. Ritchie & Co., of 46, Hatfield Street, Southwark, S.E. A variety of patterns are obtainable, varying from single-tube stoves, for use in bathrooms or small offices, to large ones suitable for clubs, halls, schoolrooms and similar places. It has been found that, taking gas at 3s. per thousand cub. ft. and coal at 25s. a ton, the "Lux-Calor" gives heat equal to a coal fire at 20 per cent. less cost. Stove No. C 1 burns 6ft. of gas per hour, and will heat a room 20ft. sq.; its cost is 70s. The products from the automatic system of condensation in these stoves (which have been supplied to His Majesty the King, the Bank of England, Mansion House, and for other important buildings) amount to an average of forty fluid ounces in ten hours, and consist of water, sulphuric acid, sulphurous acid, carbonic acid, iron, ammonia and some organic matter.

Builders' Hardware and Ironmongery.

Messrs. O'Brien, Thomas & Co., wholesale hardware factors and merchants, of 17 and 18, Upper Thames Street, E.C., send us a copy of the new edition (No. 36) of their general catalogue. Such a catalogue of grates, ranges, and other builders' hardware and ironmongery does not call for much comment in these columns. It is, however, a thoroughly comprehensive one, and should be found most useful; especially as it is produced in the handy form of a small thick book, neatly bound. A two weeks' sale of odd and surplus stock is now being held at the firm's showrooms. It closes on Saturday next, October 26th.

Street Lighting.

We have not yet arrived at that state of perfection in electric lighting which will result in "point" lighting being superseded by "glow" lighting, but in several instances successful attempts toward such a result have been made. Though we have become so accustomed to the use of electric light in our streets, in reality it is only a comparatively short time since it was first adopted; yet the success which has attended its wide introduction is clearly proved by the installations now established in almost all the towns throughout the country. Good fittings are essential to success, and in this connection we would draw attention to those made by the Improved Electric Glow Lamp Co., Ltd., of 7, Great Newport Street, London, W. By the use of silvered conical I.E.G. lamps a mean illumination of sixty candle-power is obtained over an area of 2,000 sq. ft. for an expenditure of 100 watts. As the connections are simple and inexpensive, these lamps can be very conveniently employed where existing gas-lamps are used in place of electric light standards; but it is of course preferable that properly-designed electric standards should be used, such as the "Kingston," illustrated in this firm's catalogue. Where the I.E.G. lamp system may not be considered satisfactory, other types may be used with an arrangement of multiple glass mirrors which diffuse the light pleasingly. Besides glow lamps the company also supplies arc lamps fitted with a patent raising and lowering gear which saves 50 per cent. in the cost of trimming, and as the lamps are enclosed they entail very little expenditure on carbons.

A New Church of St. Michael and All Angels, Northfield, Rotherham, was consecrated recently. The church is in the Early English style, comprising nave and aisles, chancel and baptistery. It has cost about £5,300. Mr. E. Isle Hubbard is the architect. A feature of the exterior of the eastern gable is a representation of the Crucifixion.

Surveying and Sanitary Notes.

Messrs. George Jennings, Ltd., of Lambeth Palace Road, London, S.E., have been appointed sanitary engineers to His Majesty the King.

"Building in its Relation to Health" was the title of a lecture by Mr. Keith Downes Young, delivered to candidates preparing for the examination held by the Carpenters' Company in sanitary building construction at the Carpenters' Hall, London Wall, last Thursday week. Mr. Young summed up the conditions which made for health in a dwelling house as follows:—(1) A site which was clean and dry, and an aspect which was light and cheerful; (2) efficient ventilation; (3) rapid and effectual removal of sewage; (4) ample and pure water supply; (5) construction which should be proof against damp arising from soil, walls, or roof; (6) materials free from organic impurity; and (7) rooms of sufficient size and properly lighted.

The Sanitary Condition of Weymouth.—Dr. R. Deane Sweeting, one of the medical inspectors of the Local Government Board, has furnished to that Department a report on the general sanitary circumstances and administration of the borough of Weymouth and Melcombe Regis. As the result of his inspection of the borough, Dr. Deane Sweeting emphasises the need for greater attention to the condition of the many insanitary courts and the more vigorous dealing with them under the Housing of the Working Classes Act of 1890, a more rigid enforcement of the building by-laws, consideration by the town council and their officers of the questions of flushing and ventilation of the sewers, more extended provision of water to closets, undertaking of scavenging by the corporation and the provision of a destructor, submission of a new series of by-laws for (1) nuisances, (2) slaughter houses, (3) common lodging-houses, and (4) offensive trades for confirmation by the Board, and a better enforcement of the existing regulations under the Dairies, Cowsheds, and Milkshops Order of 1885.

A New Seawall and Apron at Penmaenmawr, for the support of the new promenade, is to be completed by July next year. The work is being carried out under the supervision of Mr. E. Worrall, the surveyer to the Urban District Council without the intervention of a contractor. The face of the sea wall is to be composed of Anglesey limestone, which is to be obtained from the Traethbychan quarry, each stone to be delivered ready dressed. The seawall will be 400yds. long, 12ft. high, and 6ft. wide at the base. The base of the apron will be bedded against piles, which will be driven by steam pile-driving machinery. Steam cranes, steam concrete mixing machinery, and steam stone-crushing machinery are being used. By arrangement with the London and North-Western Railway Company a temporary line will be laid from the promenade into the goods yard adjoining, so that the crane used on the works will be able to enter the yard and unload the stone from the railway waggons, thus greatly facilitating the work. The stone excavated from the shingly beach will be broken in the crusher and converted into concrete by the mixing machine, to form the inner portions of the wall. The promenade works will be the subject of further operations in the following slack season.

Registration of Plumbers.—The committee of representatives of District Councils for Belfast, Birmingham, Bradford, Cardiff, Dublin, Edinburgh, Glasgow, Leeds, Liverpool, Manchester, Nottingham, Plymouth and Sheffield, acting in conjunction with the Plumbers' Company, deem it highly desirable that a prescribed apprenticeship or course of training should be recognised in connection with the national registration of plumbers. A special form of indenture has been prepared for the purpose by a conjoint board, composed of representatives of the London Society of Associated Master Plumbers, the United Operative Plumbers' Association of Great Britain and Ireland, and the Plumbers' Company. The indenture, which is approved by the Court of Chancery, includes definitions of the character and scope of the work of the registered plumber and of the term "sanitary plumbing" as approved by the Parliamentary Committee on Trade, in order that the sanitary bearing of the work of the registered plumber may be generally recognised by plumbers, as well as by architects, health authorities, and others, as constituting the reason for the registration system and the ground of the application for statutory powers to be conferred on the registered body. Communications have been addressed to all the local authorities acting in conjunction with the Plumbers' Company, urging their co-operation, and recommending that a register of apprentices should be kept in each district.

A Hull Improvement Scheme.—Mr. Walter Long, the President of the Local Government Board, visited Hull last week for the purpose of opening two new streets which have been formed in the heart of the city. The new streets converge at the city end of Prospect Street, which is a continuation of Beverley Road. King Edward Street is on the direct line to the old town within the docks; while Jameson Street leads on through George Street to the North Bridge and Holderness Road. They are about 75ft. wide, will be illuminated with the electric light and the buildings to be erected upon them are restricted to a minimum height of 36ft. A great deal of the property demolished within the Saville Street area was slum property, and three rather unsavoury thoroughfares have entirely disappeared. In order to acquire the necessary land the Corporation have had to spend £220,000; but, already £120,000 has been received from the sales of sites. Other portions of the city improvement scheme are making rapid progress. The blocks of property bounded by Waterworks Street and St. John's Street, have been acquired for the City square, which is to contain the Queen Victoria Memorial; and £35,000 has already been spent in obtaining the land for a new street from the Monument Bridge to Lowgate. A statue of William de la Pole was unveiled at the junction of King Edward and Jameson Streets.

TENDERS.

Information from accredited sources should be sent to "The Editor." Results of tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

BERKHAMPSTEAD.—For execution of certain works of addition and of alterations in the infirmary and workhouse of the union at Berkhampstead, for the Guardians. Mr. C. H. Rew, architect, Berkhampstead. Quantities by Mr. Josh. Rookwood, 25 Bedford Row, W.C.:—

G. Jackson, Sutton	£1,468	0
Dupont & Co., Watford	1,412	0
J. & J. Goss, Watford	1,405	0
G. & T. Cannon, Aylesbury	1,347	0
Waldo & Cox, Henley-on-Thames	1,323	0
H. Martin, Northampton	1,318	0
G. Wiggs, Watford	1,306	0
T. H. Coleman, Bedford	1,234	0
E. Wright, Tring	1,212	0
C. Brightman, Watford	1,199	0
J. Honour & Son, Tring	1,152	0
H. & J. Matthews,* Castle Street, Berkhampstead	1,110	10

* Accepted. [Architect's estimate, £1,200.]

BIDEFORD.—For the construction of about 400 yards of 15-inch and 9-inch stoneware and about 200 yards of 12-inch and 9-inch cast-iron pipe sewers, the laying of a cast-iron water main, the restoration of existing sewers, and the construction of manholes, ventilators, flushing stations, automatic pumping station, hydraulic pumping machinery, and storm overflows in connection with the sewerage and disposal of the sewage of East-the-Water at Bideford, for the Corporation:—

E. R. Lester, 13 Whitefield Terrace, Plymouth	£3,935	0	0
J. & T. Benns, 104 Wellesley Road, Croydon	2,745	16	5
R. H. B. Neal, Princess Square, Plymouth	2,624	0	0
S. Wood, 10 Richmond Avenue, Montpelier, Bristol	2,616	17	4
Dart & Pollard, Midvale Works, Paignton	2,607	13	7
M. Bridgman, Paignton	2,583	18	10
E. Ellis & Son,* Bideford	2,318	13	6

* Accepted.

BRIDLINGTON.—For the erection and completion of Central Schools and caretaker's residence at Oxford Street, Bridlington, for the Bridlington United District School Board. Mr. J. Earnshaw, M.S.A., architect, Bridlington:—

J. Rennard	£16,533	19	0
Palframan, Whitby	15,451	6	9

G. R. Mann	347	13	5
E. W. Hollingsworth*	338	7	9
G. Wilson	318	0	0
Free & Sons	308	18	0
Felkin & Watson	278	0	0
H. Brown	263	13	9
Road.			
H. Brown	£1,266	2	5
Adams & Co.	1,237	3	10
Felkin & Watson	1,234	0	0
R. Ballard & Co.	1,185	0	0
G. Wilson	1,179	0	0
Free & Sons	1,149	8	5
W. Neave & Son	1,129	18	0
G. R. Mann	1,125	0	0
E. W. Hollingsworth*	1,108	8	10

* Accepted.

SMALL POX IN LONDON.

OUR INSURANCE POLICY NO. 3

covers, without extra charge, the risk from this and similar infectious diseases.

In view of the numerous cases daily reported, intending assurers should take advantage of this policy at once.

Scheme No. 3 is an Accident Insurance of **£1,000,** with these additional advantages:

Ordinary Risks,	**£500** for Permanent Total Disablement.
Premium, £3/-/-.	**£6** per week for Temporary Total Disablement.
Hazardous Risks,	**£1 10s.** per week for Temporary Partial Disablement.
Premium, £3/10/-	**£30** Annuity.
	£3 per week during confinement from such illnesses as Small Pox, Diabetes, Scarlet Fever, Carbuncle, &c., &c.

The Proprietors of the "BUILDERS' JOURNAL" offer this most valuable policy as a special consideration to their regular subscribers. Its advantages are guaranteed by the Ocean Accident and Guarantee Corporation, Limited.

Write for proposal form.

SCHEME NO. 2

is an Accident Insurance for £500, with the following additional advantages:—

Premium, 1/-	**£250** for Permanent Total Disablement.
	£2 10s. 0d. per week for Temporary Total Disablement.

FREE ACCIDENT INSURANCE.

In addition to the above, the Proprietors of the "BUILDERS' JOURNAL" also offer a **FREE** Accident Insurance of £500 to every regular reader of the paper.

This insurance is known as Scheme No. 1.

(For the conditions under which policies Nos. 1 and 2 are issued readers should refer to our pamphlet, sent on application.)

SPECIAL NOTICE.

(1.) It is not necessary to subscribe direct to the office in order to secure the benefits of the above schemes.

(2.) Even if ordered through a newsagent the subscription need not be prepaid for a year. It is sufficient to order it and pay as may be arranged with the newsagent.

(3.) It is sufficient for us to have an intimation from the newsagent that he supplies copies regularly.

(4.) Policies can be issued either direct to the subscriber or through the newsagent, whichever may be preferred.

(5.) In applying it is not necessary to write a long letter—a postcard will do, giving the full name and address of the newsagent from whom the copy is obtained.

There are **Three Schemes** of Insurance connected with our Papers, guaranteed by the OCEAN ACCIDENT AND GUARANTEE CORPORATION, LTD.

If these schemes interest you, write for full particulars to
THE MANAGER OF THE
BUILDERS' JOURNAL,
EFFINGHAM HOUSE, ARUNDEL ST.,
STRAND, W.C.

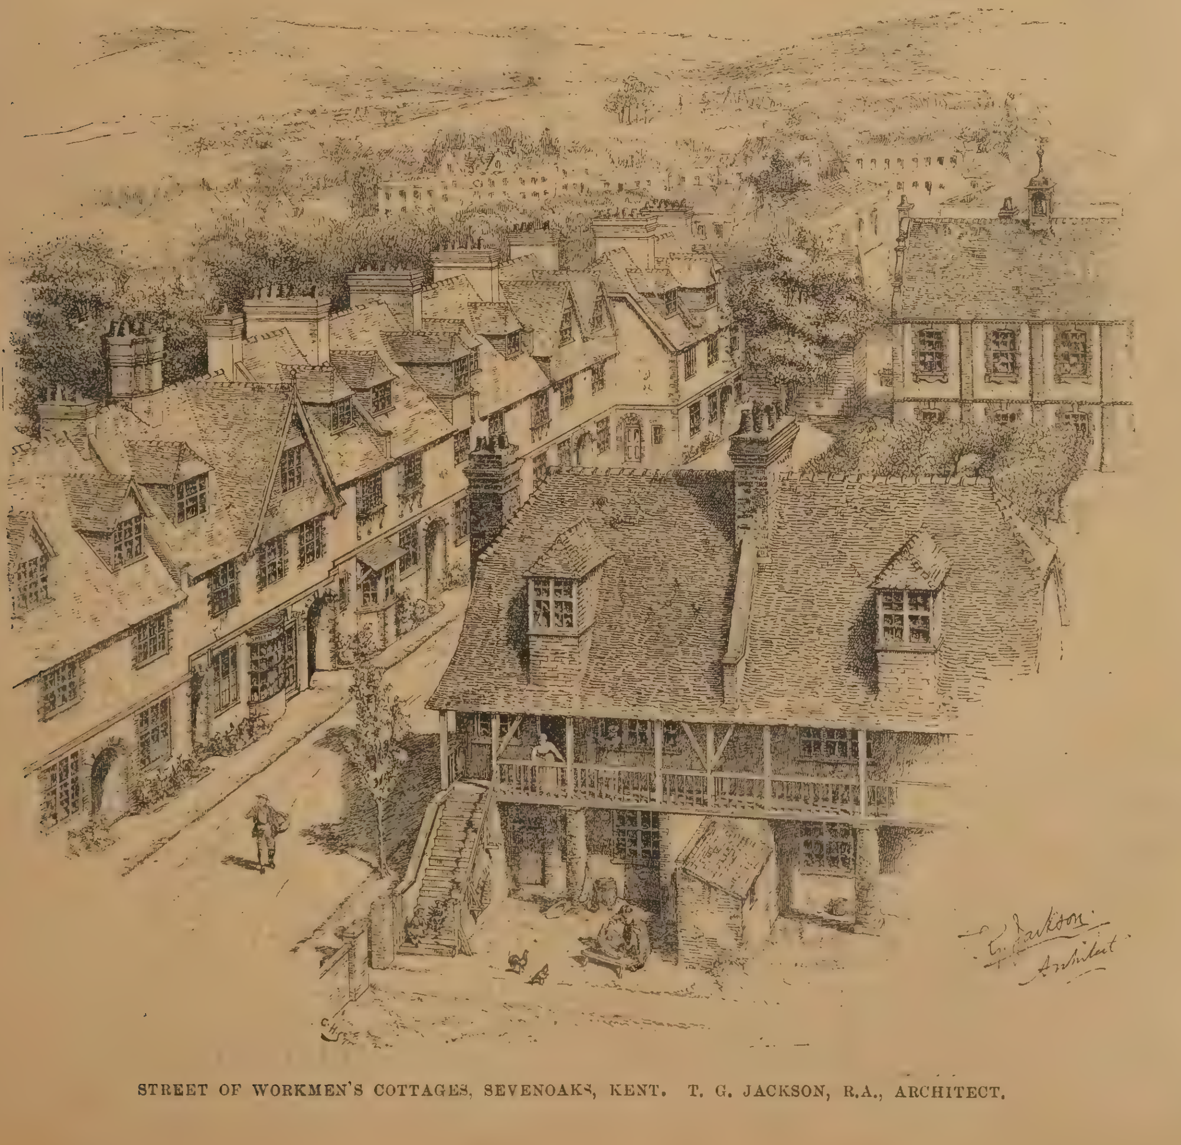
An Architectural Causerie.

A Street of Cottages.

THE street of workmen's cottages at Sevenoaks, illustrated on this page, is not only a good example of what can be done even under the strictest economy, but the drawing itself (by Mr. Jackson) is an excellent specimen of pen-work: the details are elaborated with care and thought, and there is distinct feeling of ‘ atmosphere,” which throws the houses into their respective reliefs. This is largely due to the house in the foreground being more completely finished than any of the others, its verandah in shade and its roof standing out in contrast to the sunlit street: but in the drawing of the shadows Mr. Jackson has been less fortunate than with the remainder, for they are hardly sharp enough, and (like the shadows of the dormers on the large house, for example) have somewhat the quality of "wooliness." The drawing however is well worth studying. It is always interesting to ascertain the standpoint form which a designer, and more especially an architect, starts. In the case of Mr. Jackson this is clearly shown in his first book, "Modern Gothic Architecture" (published in 1873 when he was in his thirty-ninth year), a book which, on the whole, represents his maturer convictions. Though it may be said that Mr. Jackson's best and most individual designs are not based on Gothic at all, but on Jacobean, it is well first to understand his view of this much-vexed question. He regards as Gothic all buildings which confirm to the conditions of English climate, material and habit. He once wrote: "The English Renaissance, as it appears in such buildings as Audley End and Kirby (a building by which I was strongly influenced when designing the schools at Oxford), Knowle, and others of that style and date, is, from my point of view, a Gothic style; and when the Gothic element drops out of it, as in pure Palladian, it becomes, to my taste, uninteresting." Not everyone will accept such a definition, but it is helpful when forming an estimate of Mr. Jackson's work.

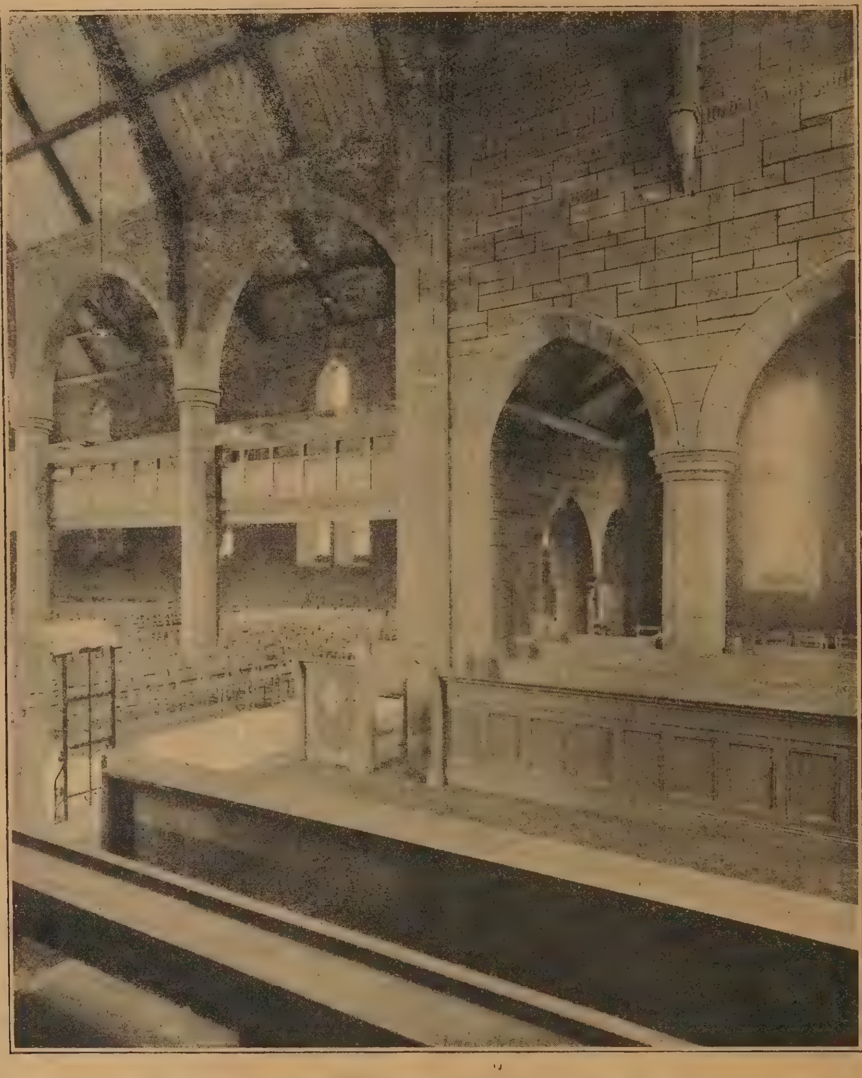
The British Workman.

ARCHITECTS are constantly deploring that the modern workman is such uncompromising material for the production of anything worth looking at, and we fear the truth cannot be gainsaid. Apart from the wild-cat ideas of the reckless socialist, apart from the impracticable dreams of the æsthetic idealist, and disregarding the comforting doctrine of the ignorant optimist—what hope is there under modern conditions of developing in our workmen that skill and intelligence which is essential to all works of excellence? It is certain that we shall never reach such a state whilst workmen are merely "time-machines" (but not Mr. Wells's), when they throw down their tools at the first stroke of the clock in the manner which drew forth the righteous anger of Adam Bede. Everyone pleads helplessness, because the moment they attempt any reform the pocket is touched, and there's an end to most things. So fierce is the competition, the master contends, it is only by getting a maximum of work for a minimum of wage that he is able to make a profit; and the workman excuses himself on the ground that it is not possible for him to produce good work at the rate and price demanded. This is the old cry of



STREET OF WORKMEN'S COTTAGES, SEVENOAKS, KENT. T. G. JACKSON, R.A., ARCHITECT.

the unprofitable servant, and it has not improved with age. There is no doubt that a great improvement could be effected if master-builders, master-masons, and others in authority, only tried to train their eyes and hands; but they won't and don't; and it is not to be expected that those in their employ will set them an example. A bricklayer's whole duty is not simply to lay bricks in a straight line, nor a mason's to square a stone with exactitude. There is more for them to learn than that; and if they only had a fraction of the sense of what constitutes beauty in plain walling or proportion in solid masonry, we should see better work than that in the average building. True, the architect (or his equivalent) is much to blame. The workmen are only translating his design into solid substance, and in many cases it is not their fault if the result be appalling. Yet, while the artizan remains as painfully incapable of knowing good from bad, how can he expect to be given a free hand in the execution of a design? There are those who believe that the hope of architecture lies in a return to the methods of the Middle Ages. There was never a greater fallacy. The change which has taken place since those days is irrevocable while we remain a world-power, and no permanent good will attend any scheme which tries to evade modern conditions. The only hope is to attempt to alter the modern builder's and the modern workman's idea of good building—for both are wilful victims to false ornamenttation, dummies and shams—and to engender in them a true love for their work. That is the problem. The difficulty is how to solve it. This most certainly will be done by individualism and not by collectivism. It is the unit which is at fault.



ST. BRIDE'S CHURCH, PARTICK, GLASGOW: VIEW OF CHAPEL AND NAVE ACROSS CHANCEL. P. MACGREGOR CHALMERS, ARCHITECT.

MEN WHO BUILD.

No. 66.—P. MACGREGOR CHALMERS.

IT is always difficult to form a just estimate of the work of an artist; but the difficulty is greatly increased if he be a contemporary. His work is of necessity incomplete and out of focus, so that it may be unduly prominent or, on the other hand, too great to be adequately appreciated at so short a range. To counterbalance these disadvantages, however, one has naturally a greater knowledge of a contemporary as a man than any writer of a subsequent generation can hope to obtain. And it is necessary, even in an approximate manner, to form some estimate of every man who is adding to the history of his art. Of these one of the most prominent in Scotland is Mr. P. Macgregor Chalmers.

Mr. Chalmers is, by profession and temperament, a church architect. He possesses that feeling of religious earnestness which dominated the mediæval master-craftsman, and which consequently is reflected in all his work. His simplest church never degenerates into a hall which might be used for any secular purpose, but always preserves for the worshipper the feeling that he is in the house of God. And this, when one analyses it, is the sole reason for church-building; for if a church is built only to contain a certain number of people for a few hours every week, this function might be performed by most public halls and the building of churches be abandoned.

Mr. Chalmers considers that the chief purpose of a church is to stimulate worship. This being the idea with which he starts, it is most natural to find that his church exteriors are very simple and reserved and that he concentrates his thought and expends what money may be at his disposal on his interiors, believing that the inside of a church should always be made more attractive than the outside. And to this end he abjures plaster, and wherever possible finishes his churches inside in stone, which he makes not only monumental but interesting by utilising it as a field for appropriate symbols and texts carved on the surface. These are not at all obtrusive—in fact, they require in some instances to be sought out; but this must afford those worshippers who make these little discoveries a vast amount of pleasure. His churches, moreover, show that thought has been expended on even plain wall-surfaces. Mr. Chalmers was the first to introduce glass mosaic in his church memorial work. He uses rich colouring wherever possible.

As a result of his studies of the art of the early Christian period as left to us in sculptured stones, &c., we find Mr. Chalmers employs much interlacing and so-called Celtic work. In every case we find he has that love for sound material and good workmanship, both fitly employed, which characterised the mediæval craftsman, preferring rather to be content with plain stone and wood and iron and to allow the material to tell its own tale, than to have counterfeits of more expensive materials covered with meaningless misapplied ornament.

Mr. Chalmers has the *perfervidum ingenium* of the true Scot, and perhaps as much as any has realised the truth of Tennyson's lines:

> "He is the true cosmopolite
> Who loves his native country best."

His work, therefore, is naturally expressive of this feature of his character. His churches are always distinctively Scottish: they are of the soil, and appear to grow naturally from it. Thus we find that he never uses the Perpendicular style, which so many architects in Scotland affect, but which was peculiar to England in mediæval times. He rather prefers the earlier styles; but if he needs to use the later style—as, for example, in a restoration—he employs the French Flamboyant with the added Scottish charm. He has also made a special study of Norman, which he believes to be the most effective for simple and inexpensive work, though it may be elaborated to any extent. With it he gets a breadth and simplicity which is very refreshing after the self-conscious "fussy" work which we see all around us. This is well illustrated in his churches at Govan and Carnoustie.

In early life Mr. Chalmers attracted the notice of the late Dr. John Macleod, of Govan, and was largely employed by him on his church work. When the scheme for church extension for the parish of Govan—one of the largest schemes of the church—was proposed, he was appointed architect, and is still engaged in the work. The preparation for this scheme occupied several years. As the intention was to build churches perfectly suited to the Presbyterian service, combined with true ecclesiastical effect and at the most reasonable cost, Mr. Chalmers matured the type of plan seen in St. Bride's Church, Partick. This church accommodates 800 persons, and has a hall adjoining which accommodates 300. The total cost of these works, including oak fittings &c., was £4,185, or at the rate of 4¼d. per cub. ft.; yet, as will be seen even from the photograph, the work is very far from being starved or plain-looking. The church consists of a nave, separated from the single galleried aisle by a stone arcade, a chancel with choir stalls, a side chapel, organ-chamber and baptistery. A hall and vestries adjoin.

This is the type of plan which, with variations to suit the site, Mr. Chalmers has used for most of his city churches. Its chief feature is, of course, the single side aisle, by using which and by keeping the front of the gallery back to the inside line of the piers he gets quite a cathedral length to his city churches. In his village churches at Cardonald and Stepps the gallery is dispensed with, the side aisle is made much lower, and more variety is given to the outlines of the building. At Ardwell an elegant spire has been added, while to another Mr. Chalmers is building a very fine Scotch crown.

Although quite a young man, in addition to his architectural work Mr. Chalmers has found time to study work of a co-ordinate nature. By his researches at Glasgow Cathedral, at Jedburgh Abbey, and elsewhere, he has established considerable reputation as an antiquary. He believes in going to the root of the matter wherever possible; and while ready enough to propound theories, he is still more eager, by excavation and thorough examination of every nook and corner of an ancient building, to confirm them. The architect makes the ideal archæologist. Mr. Chalmers' own studies as an architect have enabled him more than most antiquaries to discover the true spirit of the workers of the past and to imbue his own work with the same feeling.

His publication of the result of his researches has naturally led to his employment in the restoration of old fabrics. For about two years he was engaged in restoring the ruined walls of Glenluce Abbey, under the direction of the Hon. Hew Dalrymple. He has also restored the walls of the ancient chapel at The Isle, Whithorn, for the Right Hon. Sir Herbert Maxwell, Bart., M.P.; and the fifteenth-century tower at Kilmun for H. J. Younger, Esq., of Benmore. He has also restored the old churches at Inverkeithing, South Queensferry, Crailing and Kilmun. He is at present engaged in restoring the beautiful fourteenth-century church of St. Monans, Fife, for William Baird, Esq., of Elie, and is also employed in designing the furnishing and seating of the nave of Glasgow Cathedral.

He has published the following works:—

"St. Ninian's Candida Casa," which is an effort to discover the site of the first Christian church in stone erected in this country. This is combined with an effort to elucidate the evolution of the transeptal plan.

In "A Scots Mediæval Architect" Mr. Chalmers gives us a biography of John Morow or Murray, a fifteenth-century architect whose name and list of works at St. Andrews, Glasgow, Melrose, Paisley, Lincluden, and Whithorn are carved on a tablet on the walls of Melrose Abbey.

"Art in our City (1896)" is an appreciative criticism of the work of contemporaries in Glasgow, emphasising the greater need for attention to æsthetic requirements in the monuments of our modern cities.

"Glasgow Cathedral: A Sketch for its History" is the latest work Mr. Chalmers has published—though he has several in hand, including one of this cathedral for Messrs. George Bell's series. Work upon this cathedral has engaged his attention during the leisure of many years, and his contributions to its history are recognised as of the greatest value. In all his studies it is apparent that no pains are spared to get at the facts. Not only are the historical documents carefully investigated, but Mr. Chalmers has had sufficient influence to interest the Government in his researches, and has on several occasions been granted permission to carry out special work in the foundations of the Lower Church which have brought to light many interesting facts.

In addition Mr. Chalmers is an eloquent lecturer—his lecture on "The Abbeys and Cathedrals of Scotland" being especially fine—and he is also an enthusiastic architectural photographer. He was one of the first of that small band which founded the Glasgow Architectural Association, and for several years he was its president. He has also been president of the Architectural Society.

This short account is a record of one who is ardent and enthusiastic in the pursuit of his profession, and who has always set a high ideal before him.

In Memory of John Ruskin.—Mr. Henry Willett, of Arnold House, Brighton, has made an interesting and valuable gift to the Ashmolean Natural History of Oxfordshire. It consists of a piece of ground about five acres in extent, comprising woodland, marsh, bog and water, and contains many local and rare specimens of animal and vegetable life. Mr. Willett's wish is that the land shall be known as "The Ruskin Plot," and that it shall be kept for all time in its natural condition. In order to ensure this a trust is being prepared which will vest the plot in trustees. Mr. Willett has done for Oxford what the generosity of Mr. Walter Rothschild had accomplished for Cambridge in securing for that University a piece of Wicken Fen, the haunt of the swallow-tail butterfly. The ground is situated at Cothill, near Abingdon, Berks, and is not meant so much for collecting purposes as for observation. It is hoped that a systematic record year by year of a piece of ground uninterfered with by cultivation, will be of itself of considerable interest.

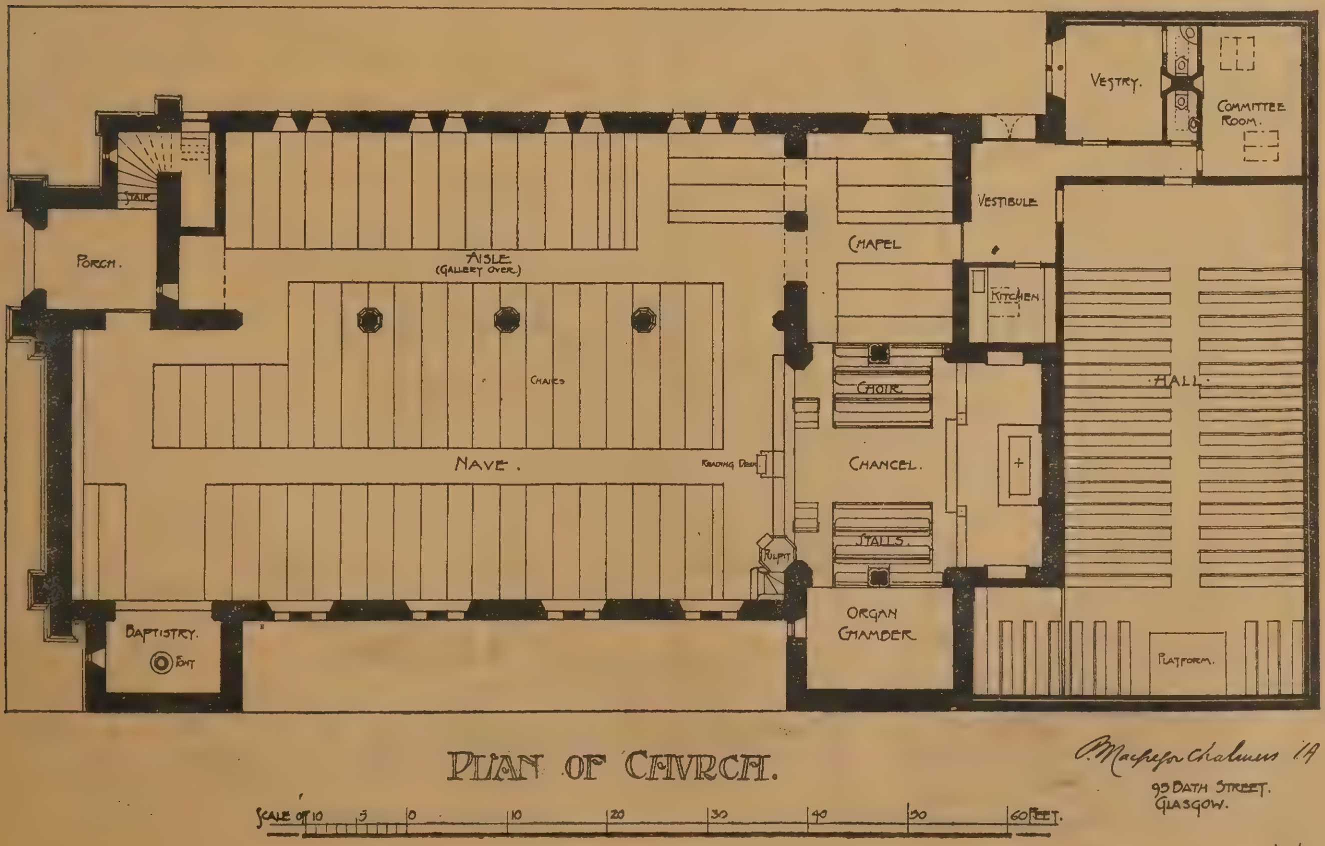
NEW CHURCH AT BLAIRS.

A CHURCH at St. Mary's College, Blairs, was opened last Wednesday. The altar is by Messrs. Pearse & Sons, Dublin. The front, of white Carrara marble, is divided into three panels, the centre one containing a representation of Leonardo da Vinci's famous picture, "The Last Supper," cut in high relief. The tabernacle is of beaten brass. Mr. Robert Curran, of Warrington, is the architect. The church is in the middle period of Gothic style, with distinctively Scottish features introduced in the details. It is built of Rubislaw and Kemnay granite, the finely-hammered dressings being of the latter stone, while granite quarried on the Blairs College estate has been utilized for the rubble work and less conspicuous masonry. The tracery of the windows is of freestone, of a colour which harmonizes very well with the harder grey stone. The building, which is cruciform in plan, is 120ft. long, with a nave 35ft. wide, and having side chapels 22ft. long and 17ft. wide. There is a square tower at the north-east corner, with angle buttresses surmounted by pinnacles. Provision has been made for the erection of a spire rising to a height of over 120ft. The roof has been covered with slates of two tints—blue and purple.

Internally the church is divided into sanctury, choir and nave. The fittings are composed of oak and pitch-pine, elaborately carved stalls and rails, with an open-timbered roof. The choir is seated for over 120 students, and in the body of the church accommodation is meantime provided for about 140 people. The choir stalls were supplied by Messrs. Mayer & Co., the well-known church furnishers, of Munich and London. The organ, which is being built by Mr. E. H. Lawton, Merkland Road East, Aberdeen, will be placed in a specially-constructed recess on the north side of the church.

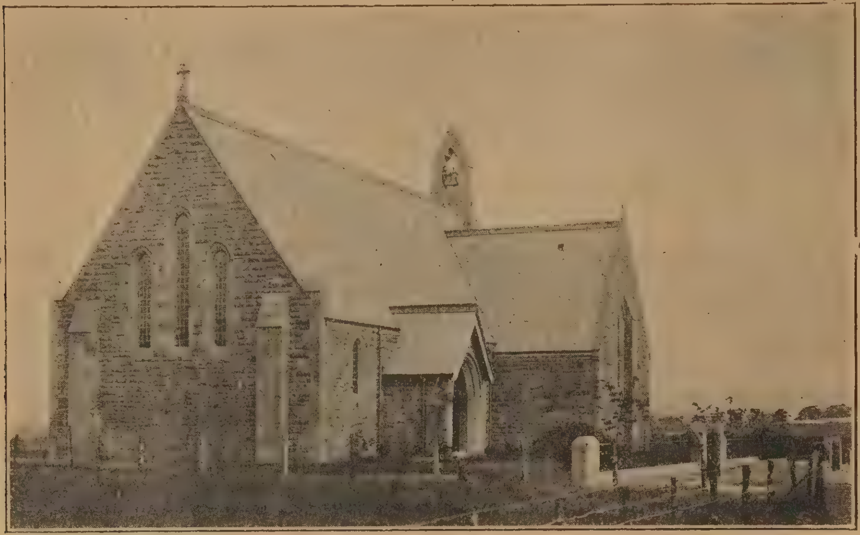
The church has cost about £12,000; and the contractors for the various works were: Mr. Robert Buchan, mason; Messrs. M'Robbie & Milne, carpenter; Mr. J. Bannochie, plasterer; Mr. Edward Copland, painter; Messrs. Thom & Strachan, plumber; and Mr. J. Fyfe, glazier—all of Aberdeen.

SAINT BRIDE'S CHURCH. PARTICK:



PLAN OF CHURCH.

P. Macgregor Chalmers I.A
95 Bath Street.
Glasgow.



STEPPS CHURCH, GLASGOW. P. MACGREGOR CHALMERS ARCHITECT.

SOCIETY OF ARCHITECTS.

THE annual general meeting of the Society of Architects was held on Thursday last at St. James's Hall, Piccadilly, W., Mr. Walter Emden presiding. The minutes of the previous meeting having been read and confirmed, Messrs. C. Bagot, of Deansgate, Manchester; Clayton Botham, of 128, Queen's Road, Brighton; and H. C. Lander, A.R.I.B.A., of Arundel Street, Strand, W.C., were elected members of the Society, and Mr. A. H. Weeks, of Bristol, was elected a student. Mr. Ellis Marsland, hon. secretary, then read the report of the Council for the year ending October 31st, 1901, which stated that the past year has been one of progress and development. A large number of applications for membership had been received, resulting in the addition of 23 new members, while the students' register had also increased, the total membership now being 592, the highest yet recorded; 2 members had died, 14 resigned, 3 had been removed from the list, and 3 studentships had lapsed. The half-yearly examinations to qualify for membership had attracted an increased number of applicants, of whom seven were successful; one candidate, Mr. A. A. H. Scott, being awarded the silver medal of the Society. The syllabus of examination had been revised and strengthened.

The Council had had under consideration the advisability of publishing a form of building contract. It had also considered the question of providing lectures or other means of instruction for students of the Society. The question of forming a technical circulating library for members is still engaging the attention of the Council.

Two competitions had been held during the past session, open to students of the Society only, of whom five entered, the successful competitors being Mr. G. E. Mitchell, of Lowestoft, and Mr. A. T. Thompson, of Buxton.

The Council had continued its policy of keeping before the profession the question of statutory registration, and meetings were convened and held in Edinburgh and Glasgow in May. Only small meetings resulted, but at Edinburgh the usual resolution approving the principle of statutory registration was passed; while at Glasgow, though no resolution was put, a paper was read and discussed and the matter brought before some of the leading architects. As invariably the case, no opposition was offered to the proposal, and the Society will not relax its efforts in working for a principle which it believes to be for the ultimate advantage of the public and the architectural profession.

The Society of German Engineers having invited the Council to appoint some member to co-operate with it in producing an International Technical Dictionary, Mr. G. A. T. Middleton, A.R.I.B.A., member of Council, was deputed, and has since undertaken the work.

It is expected that the balance-sheet which will be presented at the November meeting will show that the surplus funds of last year have been considerably augmented.

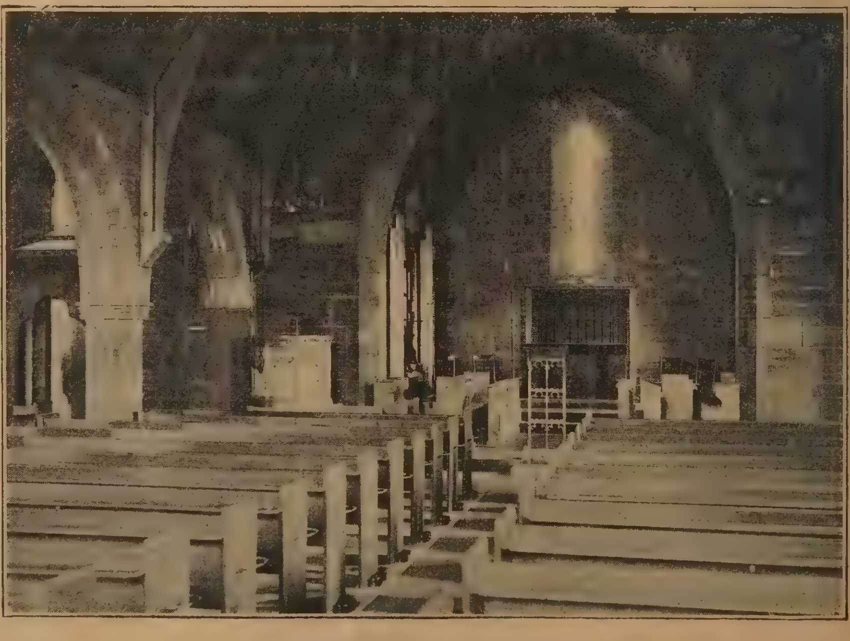
While the Society continued year by year to increase its membership and extend its influence, there was still plenty of scope for further efforts, and its resources can be developed and increased in proportion as the membership grows. The retirement from office of the president, Mr. Walter Emden, L.C.C., who had for four consecutive years untiringly and generously devoted himself to the interests of the Society, was referred to, and the Council desired to place on record its appreciation of his ready and valuable services.

The result of the ballot for officers and members of the Council was then announced as follows:—President, Mr. Silvanus Trevail, F.R.I.B.A., J.P. (Truro); vice-presidents, Messrs. Walter W. Thomas (Liverpool) and G. Gard Pye (London); hon. secretary, Mr. Ellis Marsland (London); hon. corresponding secretary, Mr. W. Cooper (Hastings); hon. treasurer, Mr. H. G. Quartermain (Merton); hon. auditor, Mr. J. Bartlett; council, Messrs. R. G. Bare (London), W. R. Bryden, F.R.I.B.A. (Buxton), Charles Caine (Manchester), J. Williams-Dunford (London), J. W. Dyson (Newcastle-on-Tyne), W. L. Grant (Sittingbourne), W. J. Jennings, F.S.I. (Canterbury), W. R. Mallett, F.S.I. (London), G. A. T. Middleton, A.R.I.B.A. (London), A. E. Pridmore, F.S.I. (London), J. H. Richardson (London), and W. A. Scott, A.R.I.B.A. (London).

Mr. Emden then wished the society a continued successful career, and referred in complimentary terms to the new president, Mr. Trevail, who was unable to be present. Mr. G. Gard Pye then proposed and Mr. B. J. Tucker seconded, Mr. J. H. Richardson supporting, a vote of thanks to Mr. Emden and the officers and council for their services, and Mr. Emden and Mr. Marsland briefly acknowledged.

A BIRMINGHAM THEATRE.

THE Theatre Royal, Birmingham, with all the adjoining premises lying between Temple Street and Colonnade Passage, will be pulled down shortly, and a large block of buildings will be erected. Mr. J. Edwin Forbes is the architect, and Mr. J. Charles the builder. The New Street front will have an elevation in the English Renaissance style of the modern school. The first two storeys are designed to be built of red granite, with a recessed couple-columned colonnade above, and the upper portions are to be of terra-cotta. The architectural effect is gained by projection rather than detail. The central entrance will be to the Arcade, which will run a length of about 200ft. and comprise a domed rotunda. There will be an entrance on the left to a restaurant, to be approached by a short flight of steps; while on the right will be the main entrance to the new Theatre Royal. Access to the upper part of the house will be given by double staircases, mounting one within the other, so that whilst a far greater number of people are given ingress, space is closely economised and safety is better assured. To the various parts of the theatre there will be in all nine emergency doors. The orchestra will be almost hidden in a well sunk in front of the stage and possessing sounding qualities arranged on a plan that has found favour in German playhouses. The lighting will be so arranged that the glare that tries the eyes during an interval will be avoided. The question of ventilation has been carefully considered, and heated air will be drawn from behind the stage to all parts of the house. The bars are to be placed in between the floors, and disconnected from the auditorium by corridors, which will diminish any passage of sound. The auditorium will include eight rear and six stage boxes. The plans provide for as many as eighteen dressing-rooms, with a bathroom on every floor and a green room. The main entrance to the theatre will be treated in Italian marble, and painted figures will be largely utilised in the scheme of internal decoration. The Arcade running from New Street to Stephenson Street is not the least prominent feature of the reconstruction. It will be of lofty proportions, and will contain fourteen shops.



STEPPS CHURCH, GLASGOW.

SANITARY ARCHITECTURE.

By MARK H. JUDGE.

On October 17th the second of the series of lectures on Sanitary Building Construction at the Carpenters' Hall, London Wall, was given by Mr. Mark H. Judge, A.R.I.B.A., F.S.I., Associate of the Society of Medical Officers of Health. The lecture was illustrated by sketches on the blackboard. Mr. Judge said:—

The subject of my remarks is the art of planning and constructing buildings, and therefore the title "Architecture" would have sufficiently described what I am about to say; but with the immense growth of populations and the concentration of people in cities, with the busy lives we all live in consequence, it is often desirable to emphasize a simple description by the use of an appropriate adjective; hence I have made the title of my address "Sanitary Architecture." The architect is the chief workman; and as an architect speaking to clerks of works, builders' foremen, and others who have or hope to have to deal with the construction of buildings I desire to speak as from one workman to others.

Design is our starting-point, and in this the planning should be our primary consideration. With regard to site and aspect I do not propose to deal. Both are large questions, and every separate case must be dealt with on its own merits. In cities there is often no choice, and even elsewhere the situation, contour of the land, &c., often make it necessary to vary planning in relation to the points of the compass.

Planning.

Given the site and having the aspect of our building settled, the first consideration therefore should be to so design the plan of our building that it may best serve the purposes to which it is to be devoted. Doors for access at all convenient points, windows to secure ample light and ventilation, well-lighted corridors to separate and give access to the different apartments, will always give an irregular outline which will lend itself to architectural effect. This irregular outline, so desirable from an artistic point of view, will be accentuated where the water-closets, lavatories and sinks are so placed that disconnecting ventilation between these arrangements and other parts of the building is secured by means of lobbies with windows in opposite walls, which is the only method by which a through current of air can be obtained without complicated devices beyond the control of the ordinary residents. In this and all other matters connected with a building it should always be our aim to so contrive that when it is handed over to those who are to occupy it there shall be as little need as possible for the intervention of greater skill than the ordinary occupants may be reasonably expected to possess. In so far as specially-skilled workmen may be necessary to ensure a continuous satisfactory condition of the building, in just so far have those responsible for its construction proved their want of skill either in design or workmanship.

Elevations, Sections and Roofs.

Having planned our rooms, corridors, &c, we proceed to design our elevations, sections and roofs, and here again the uses to which the building is to be put should be the first consideration. As the human face is an index of the character of the individual, so should the elevations of a building indicate the purpose for which the building was erected. There should be no attempt at deception. Where a rain-pipe is necessary the intelligent man desires to see that it has been provided, and is annoyed with a façade erected as if a rainy season never existed. He will also know that the pipe buried in the wall may prove a source of danger to the building at any moment, and only through necessity would he make such a structure his place of abode. If this is important in the matter of rain-pipes, it becomes doubly important with pipes from sanitary fittings, despite the retrogade action of the London County Council in the matter of soil-pipes. Until this year the by-laws of the London County Council provided that all soil-pipes should be outside the building. It is not within my province in this address to consider the question as to whether it is desirable that the State or the municipality should have power to make and enforce such a by-law as the one to which I have referred, but I have no hesitation in saying that sanitary architecture requires all such pipes to be outside, and further it maintains that these pipes, being necessary, should be provided for in and form part of the design of the elevation of the building to which they are essential.

By-laws and Soil-Pipes.

For some years the by-laws of the London County Council, under the Public Health (London) Act, 1891, provided that every soil-pipe in connection with a new building should be outside the building. This definite by-law has now been repealed, and, with the approval of the Local Government Board, another has been substituted under the Metropolis Management Act, 1855. This new by-law runs as follows: "A soil pipe in connection with a new building or an existing building shall, whenever practicable, be situated outside such building." Of course there is nothing more practicable than the fixing of a soil-pipe in the open in connection with any building, new or old, where the will exists, but the words "whenever practicable" in the new by-law must be read in connection with the rescinding of the old by-law, which was imperative and insisted on every soil-pipe being fixed outside. But none the less the absurdity of the present regulation may be illustrated by suggesting a by-law on similar lines with regard to open spaces at the back of buildings. Imagine the London Building Act amended by rescinding section 41, wherein it is enacted that "there shall be provided in the rear of every building an open space exclusively belonging to such building, and of an aggregate extent of not less than one hundred and fifty square feet." Having rescinded this definite regulation to follow the example of the London County Council, Parliament would enact a section in the following terms: "An open space in connection with a new building shall, whenever practicable, be provided in the rear of such building." The permission such a regulation might give for the erection of back-to-back dwellings would not be taken advantage of by anyone concerned in the erection of buildings which could be described as claiming to be in any way associated with sanitary architecture, and it is to be hoped that the by-law which permits buildings to be so designed that it is impracticable to fix a soil-pipe outside of them will not be taken advantage of by any who may be looked upon as worthy workers in the art and craft of building.

ST. KENNETH'S CHURCH, GOVAN, GLASGOW. P. MACGREGOR CHALMERS, ARCHITECT.

Details.

Our design must provide for secure foundations, for reliable damp-proof courses at suitable levels, and on all the lower floors it is desirable to have solid floors bedded on concrete. Externally, care should be taken to provide for the underside of all projections being throated to protect the walls from wet. Copings, sills, tops of cornices, and other projections should be weathered—*i.e.*, sloped to drain water off—and where the material is not impervious it should be covered with lead or other metal, or with slates, tiles, or a rendering of cement trowelled to a smooth face. String-courses must not be considered as merely ornamental. When properly constructed they serve to protect the walls from wet.

The wood sills of window-frames should be sunk and weathered, and where bedded on stone sills should have a metal tongue to keep out wet. Cased window-frames with double-hung sashes should have a rail between the sill and the lower bead as protection from rain, driven under the sash, and to allow the lower sash to be raised some inches to secure ventilation without draught in the lower part of the room, through the meeting rails of the two sashes. This is a better method than the practice of putting in a slip of wood below the bottom sash. Solid frames with casement sashes are best with the sashes hung to open outwards, and for purposes of ventilation it is always desirable to have opening fanlights above the casement sashes.

On the upper floors great care should be taken in the construction of the hearths for fireplaces, and perhaps the best plan to adopt is to fix a steel or wrought-iron cambered box with solid concrete to receive tiles or other facing to the hearth. The box to have a flange screwed to the trimmer, and to have a bearing between two courses of brickwork in the chimney breast.

To secure a water-tight roof attention must be paid to the inclination where slates or tiles are used; and where flat roofs are constructed especial care must be taken that the structure is of sufficient strength to prevent sagging or settlement, whether finished with concrete or asphalt or covered with lead or other metal. A slight sagging or settlement with pitched roofs covered with slates or tiles might be of little or no detriment to the building, but would be very serious with all kinds of flat roofs.

Drains.

With detached houses, all drains should be external to the building. In cities where houses are in terraces and the sewers in the public roadways, the drains are often of necessity under the buildings, but in no case should there be junctions under the building, and there should

ARDWELL CHURCH, WIGTOWNSHIRE. P. MACGREGOR CHALMERS, ARCHITECT.

be an inspection chamber on each side of the building, *in the open air*, to afford ready access for examination and testing the drain under the building. Inspection chambers are also desirable at all points where it would be necessary to have access to the drains for a thorough examination and test.

Drain pipes are made of stoneware, concrete and iron. Except where a reliable foundation cannot easily be secured, stoneware must, I think, always retain its superiority over concrete or iron, as when well glazed and of sufficient strength it fulfils all the requirements of a perfect drain. It is impenetrable by air or water; it permits perfectly air-tight and water-tight joints to be made between pipe and pipe, so that the drain when finished may be practically one pipe; it is imperishable in use and can only be destroyed by breakage. The floors of inspection chambers should be entirely of stoneware where the drains are of stoneware, and of iron where the drains are of iron. Good work, however, may be done where the channels only are of stoneware or iron as the case may be, with the benchings formed in cement, but it is better for the entire floor, channel and benching to be of the same material as the drain.

All connections with house drains should be outside the house, and the only pipes which should be directly connected to house drains are soil-pipes and ventilating pipes. Rainwater, waste-water and surface drainage should pass into the house drain through some kind of trap, of which there are many varieties.

Air-Inlets and Ventilation.

Arrangements for providing a free passage of air into drains on the house side of outfall traps, to form an air break or disconnection between sewers and house drains, are now admitted to be necessary by all sanitary authorities; indeed, the principle involved in their use is the cardinal principle of modern sanitary architecture. By means of the outfall syphon trap, with an air-inlet, which when near to buildings should be above all windows, and outlet ventilation above the roof, a building is thoroughly protected from the ingress of sewer air. That it is important that the admission of sewer air to our dwellings should be prevented is universally admitted, even when no infectious disease germs are present in the sewers, but it is often a matter of life and death. Who, indeed, would be bold enough to assert that the miles of London sewers into which every house is supposed to drain in this great Metropolis, with its five millions of inhabitants, is ever free from infectious disease germs? These sewers drain alike the palace and the worst tenement dwelling in which poverty and ignorance breed disease and invite death. With perfect house drains, properly disconnected from the sewer, the inhabitants of a town dwelling may enjoy the blessings attendant upon cleanliness; but without such disconnection from the public sewer the cleanest possible household must share the dangers resulting from the sins of others against the laws of health.

In ordinary practice the ventilation of house drains can be effectively secured by continuing the soil-pipes up to the roof, full bore. As I have already said, wherever practicable—and in all new buildings of course it is practicable—soil-pipes should be fixed outside the building; for ordinary buildings, where economy in cost is specially to be considered, strong iron pipes have an advantage over lead, inasmuch as that, while for all practical purposes they are as good, they are less expensive and are less liable to be injured by ladders, &c. In cases where the first cost is not one of the principal considerations, of course strong lead pipes should always be used.

All iron used in sanitary work should be protected by galvanizing or by a coating of Dr. Angus Smith's solution.

Sanitary authorities are not agreed about the use of cowls in connection with drain-ventilating pipes; while some recommend them others dispute their use. There can be little doubt, however, that whether cowls are or are not useful in special cases, they are not necessary for the ventilation of house drains. A 4in. ventilation pipe, open at the top, well above the roof, with the sides perforated near the end, is a simple and effective outlet ventilator.

Supervision.

To those who may be entrusted with the duty of supervising the erection of buildings, it is important to secure the intelligent co-operation of the whole of the workmen. The supervisor should regard each man as an intelligent craftsman, responsible for the quality of his work and in a measure for the success or failure of the structure on which he is engaged.

We English need to be reminded of the fact that our workmen are intelligent factors, and the art of supervision should bring this out, which can never be done where the workman is looked upon as a machine. Let all ponder well what John Ruskin has said in "The Stones of Venice": "The modern English mind has this much in common with that of the Greek, that it intensely desires, in all things, the utmost completion or perfection compatible with their nature. This is a noble character in the abstract, but becomes ignoble when it causes us to forget the relative dignities of that nature itself, and to prefer the perfectness of the lower nature to the imperfection of the higher; not considering that as, judged by such a rule, all the brute animals would be preferable to man, because more perfect in their functions and kind, and yet are always held inferior to him, so also in the works of man, those which are more perfect in their kind are always inferior to those which are in their nature liable to more faults and shortcomings. For the finer the nature the more flaws it will show through the clearness of it; and it is a law of this universe that the best things shall be seldomest seen in their best form. . . . . We are not to set the meaner thing, in its narrow accomplishment, above the nobler thing, in its mighty progress; not to esteem smooth minuteness above shattered majesty; not to prefer mean victory to honourable defeat; not to lower the level of our aim, that we may the more surely enjoy the complacency of success. But above all in our dealings with the souls of other men, we are to take care how we check by severe requirement or narrow caution efforts which might otherwise lead to a noble issue; and, still more, how we withhold our admiration from great excellences, because they are mingled with rough faults. Now in this make and nature of every man, however rude or simple, whom we employ in manual labour, there are some powers for better things; some tardy imagination, torpid capacity of emotion, tottering steps of thought, there are, even at the worst; and in most cases it is all our own fault that they *are* tardy or torpid. But they cannot be strengthened, unless we are content to take them in their feebleness, and unless we prize and honour them in their imperfection above the best and most perfect manual skill. And this is what we have to do with all our labourers; to look for the *thoughtful* part of them, and get that out of them, whatever we lose for it, whatever faults and errors we are obliged to take with it. For the best that is in them cannot manifest itself but in company with much error. Understand this clearly: you can teach a man to draw a straight line and to cut one; to strike a curved line and to carve it; and to copy and carve any number of given lines or forms with admirable speed and perfect precision, and you find his work perfect of its kind; but if you ask him to think about any of those forms, to consider if he cannot find any better in his own head, he stops; his execution becomes hesitating; he thinks, and ten to one he thinks wrong; ten to one he makes a mistake in the first touch he gives to his work as a thinking being. But you have made a man of him for all that. He was only a machine before, an animated tool."

On the Importance of Sanitation.

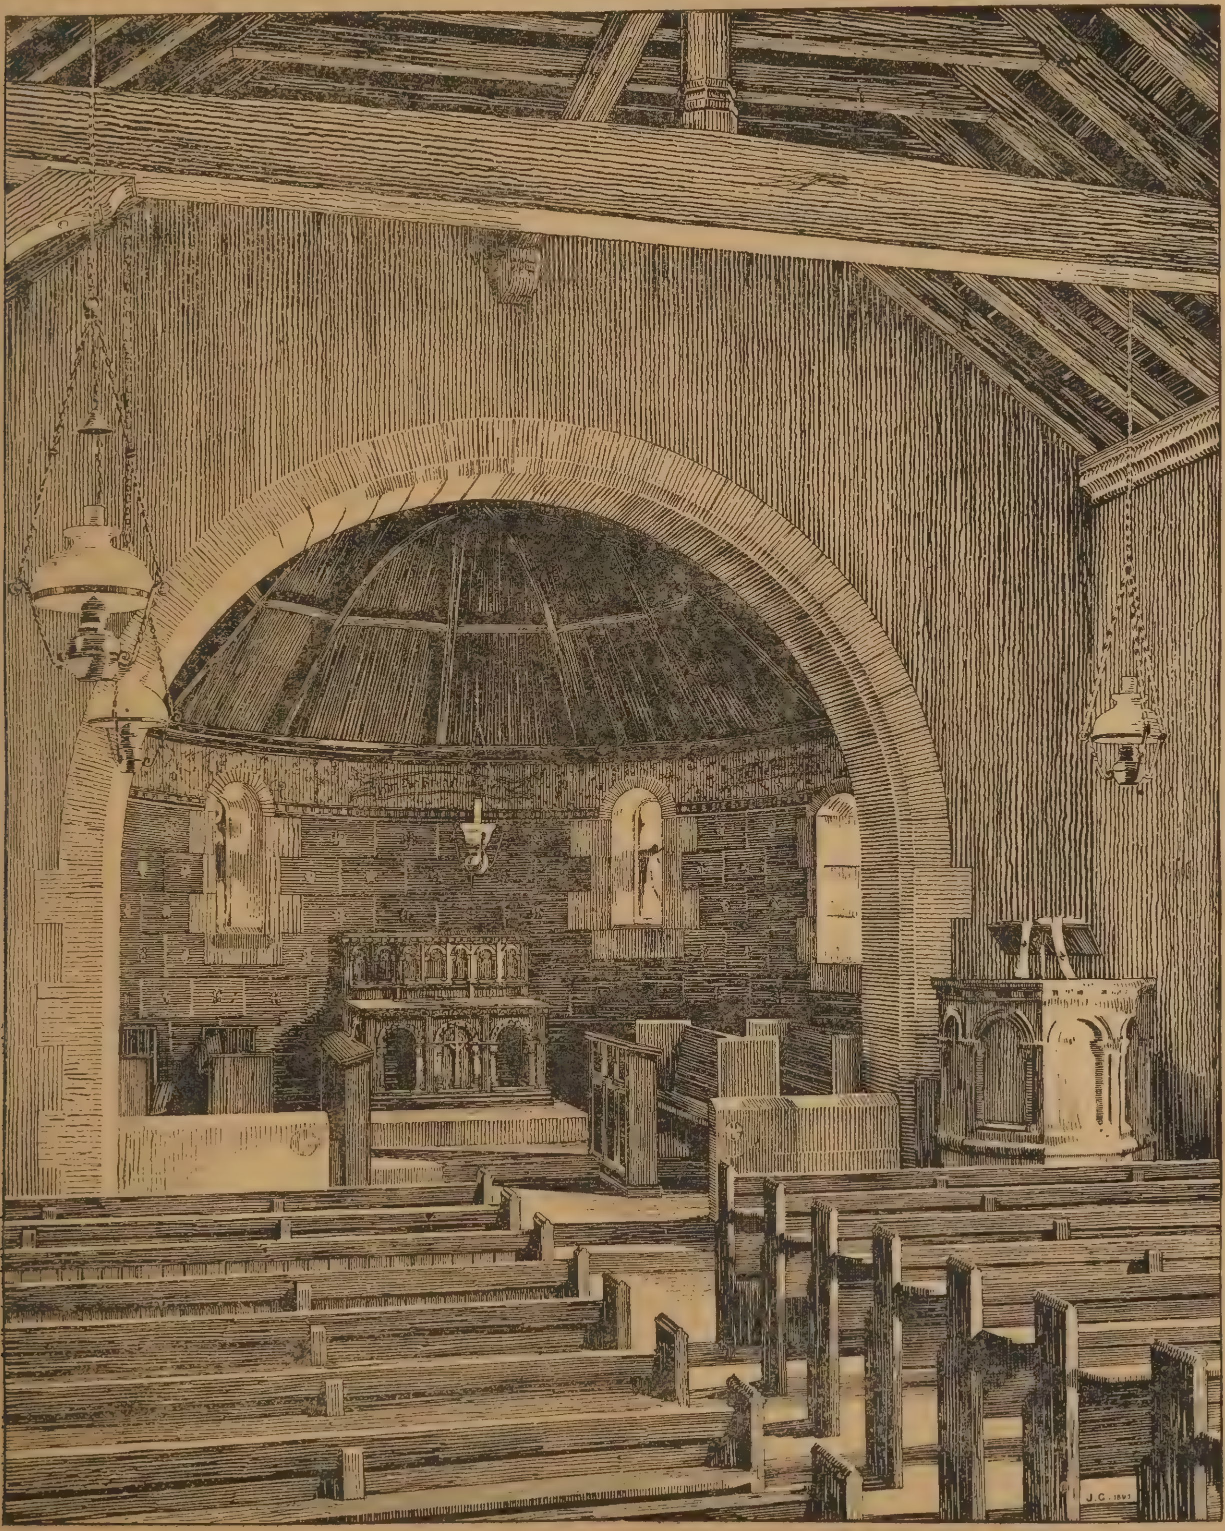
How important the work of sanitary architecture is to the community I cannot better emphasize than by quoting some words by the late John Eric Erichsen, F.R.S., president of the Royal College of Surgeons, when addressing a meeting of the Sanitary Assurance Association. Mr. Erichsen said:—

"We all know that the sound mind in the healthy body is the greatest of all blessings; but in order that the mind may be sound the body must be healthy, and for the health of the body it is necessary that the body should in its daily occupations be surrounded by influences that are, at all events, not detrimental to health. These truths are so self-evident at the present day that they scarcely justify repetition, for if there is any one circumstance which appears to me more specially to distinguish modern civilization, it is the attention that is being paid by the educated classes to the laws and to the study of hygiene. There is nothing, I take it, that more distinguishes the civilized man from the savage, or the educated man from the man who is unenlightened, than the scrupulous attention that the civilized and educated man pays to what is, after all, the first law in hygiene—cleanliness in all the actions of his body and all the surroundings of his home. The culture of the civilized man inclines him to it. It becomes almost instinctive. The knowledge acquired by the educated man compels him to it, for if there is one truth that is more determinedly established by modern science than another it is this—that a vast number of these diseases which devastate mankind are preventable; and being preventable and not prevented, they are self-inflicted. And it is not only those more fatal diseases, the typhus and the typhoid, and the plague and the diphtheria, that are so preventable, and that constantly by want of prevention we inflict upon ourselves. There is also a vast host of the minor diseases that tend to sap greatly the strength and to diminish the happiness of existence."

On the same occasion as that on which the late president of the Royal College of Surgeons made the remarks I have quoted, Sir Joseph Fayrer, M.D., F.R.S., said: "I have become aware of what a great and crying want this sanitation of dwellings has become. I know, and see constantly, how people suffer from the want of it, and it has been always a marvel to me in the present state of culture, intelligence and education how people can have remained so blind as they do remain to the evils that surround them. My firm belief is that it is from want of appreciation of the nature of the causes that produce these evils that proper remedies are not applied. Many people not seeing in their own households what is happening, therefore do not believe it. It is consequently necessary that knowledge should be spread abroad. If people came really to understand that foul emanations come from drains, and that the water we drink if connected with that with which we flush our sewers will cause typhoid fever, sore-throat, and all the train of diseases, they would insist on sanitary architecture."

In conclusion, let me express the hope that what I have said on some of the main principles of sanitary architecture will be of service—will lead to thought on matters of detail connected with the design and construction of sanitary buildings for all sections of the community, and do something to raise the sanitary standard in the homes of the people.

Glasgow Institute of Architects.—The first meeting of the newly-elected council was held on October 18th, Mr. Alexander Petrie, vice-president, in the chair. Office-bearers were appointed as follows: President, Mr. John James Burnet, A.R.S.A.; vice-president, Mr. Alexander Petrie; auditor, Mr. W. Forrest Salmon; secretary and treasurer, Mr. C. J. MacLean. Mr. W. J. Boston, 180, Hope Street, was added to the council in place of Mr. James Miller, resigned. In connection with the Alexander Thomson Memorial Studentship, a committee was appointed to make the necessary preparations for the next triennial competition, to be held in 1902.



CRAILING CHURCH. P. MACGREGOR CHALMERS, ARCHITECT.

LIVERPOOL CATHEDRAL.

SOME FURTHER OPINIONS.

THE discussion about the style of Liverpool Cathedral still continues. In a letter to the "Times" Mr. Robert Gladstone stated that of the competitive designs of 1884 those placed second and third by Mr. Christian were "Gothic" designs, while the first, Mr Emerson's, was for a design specially calculated to be in harmony (as far as possible) with the adjoining classical buildings.

The inference is that his was not a "Gothic" design, but Mr. Emerson points out that it was, in principle, plan, construction and detail, though of an early phase.

Mr. Emerson on his Design.

"The introduction of the dome no more militates against its Gothic character than the dome of Sta. Maria del Fiori at Florence militates against the Italian Gothic style of that church. The fact of the Classic surroundings on the former site was not the only reason for the dome, but also the fact that it is the only logical covering for an enormous open area in front of the choir, which is demanded by modern congregational requirements. The particular phase of Gothic selected was because the larger and broader detail would have been less in contrast to the large scale of the Classic work in proximity to it than the smaller detail of a later period; and also because sculpture and other details could be made more nearly approaching the highest class of work than could be possible without incongruity with the restrictiveness of Gothic of a late period. Were the design translated into later detail, which could easily be done, it would still be Gothic, but of a different phase. As I have no intention of competing a second time, my only motive in writing this is fairness to myself, because I am aware that persons antagonistic to anything but fourteenth-century detail have been good enough to state that mine was not Gothic, which is untrue in every sense of the word."

Where Motives for a New Style might be Found.

In answer to Mr. Reginald Blomfield's suggestion that a hint for Liverpool Cathedral might be found in such buildings as the baths of Caracalla, Mr. Gladstone asked: "Why not also in the Temple of Baalbec or Palmyra or Persepolis—or, for the matter of that, of Timbuktu?"

In answer to this Mr. Blomfield says: "Probably in any one of these buildings a competent observer would find motives (not details) of design which he might translate into a totally different expression, and this is what I suggested when I referred to the baths of Caracalla. Elmes found one motive of design here, and expressed it, somewhat literally, in his splendid room at St. George's Hall; but other architects might find other motives in the fragments of the tremendous vaults and arches of the ruins of Imperial Rome. It seems impossible after fifty years of Ruskinism to drive it into the head of the layman that architecture is not sculpture or painting, but architecture. It may seem a paradox to Mr. Gladstone, but I only state a fact when I say that there are architects nowadays who design in classical architecture and yet are inspired by the Gothic spirit as truly, so far as it goes, as any of the mediæval experimentalists of the thirteenth century, and these are the men with whom lies the architecture of the future."

Mr. J. Oldrid Scott defends "Gothic."

Mr. J. Oldrid Scott protests against the statement that Gothic architecture is played out, and that its use now means nothing but a servile reproduction of ancient buildings. He says: "Nothing could be further from the truth. Look at the grand series of churches, culminating in Truro Cathedral, designed by Mr. Pearson; look at Mr. Bodley's noble churches, or Mr. Austin's, or Mr. Temple Moore's, all founded on a life-long study of old examples, but every one of them full of life and originality, and each of them carefully adapted to the requirements of the place it is built in. The fact is that a critic is not in a position to decide authoritatively whether a building in any style is original or a mere reproduction unless he has acquired a close familiarity with that style. No one admires Mr Blomfield's work more than I do, but I do not consider that his wide knowledge of one style qualifies him for condemning the works of those who practise in another. I plead for a design instinct with the sacred character which appeals to us in our glorious old cathedrals, but at the same time essentially modern in its treatment and adapted in all respects to the spiritual needs of a great modern city."

Protest Successful: The Committee Submit.

At a meeting of the Executive Committee held last Monday it was decided, on the motion of the Earl of Derby, seconded by Mr. Robert Gladstone, that the preliminary competition for the design of the new cathedral be left open; that the time for sending in portfolios be extended till June 30th next year; and that the architects selected to compete in the final competition be paid 300 guineas each for their designs, whether they be accepted or rejected. The competition is not now limited to the Gothic style.

BRITISH SCHOOL AT ATHENS.

THE annual meeting of subscribers to the British School at Athens was held on Thursday last in the rooms of the Society of Antiquaries, Burlington House, Sir Richard Jebb, M.P., presiding. The accounts for the year 1900-1 showed that the total income had been £1,790, of which just over £900 was in annual subscriptions and £500 a Government grant. The report of the Managing Committee stated that His Majesty the King had graciously consented to become the patron of the school. The work of the school, both on the teaching and exploring sides, had been carried on vigorously under the new director, Mr. Bosanquet. The number of students entered was five, as compared with six last year. In Crete excavations were undertaken at Præsos and at Petras. At Præsos only one product of Mycenæan art was discovered, but about a mile away a large house of late Mycenæan work was discovered, and nearer the city two tombs of the same period were found, one a square chamber with a dromos, and the other a well-built beehive tomb. In the same neighbourhood a number of later tombs were opened, ranging from the Geometric period to the fourth century, and containing a large quantity of vases of various periods. Præsos itself appears from the remains discovered to have been an important place from the eighth or seventh century downwards. The remains of three other sanctuaries were also investigated. On a saddle below the Acropolis was discovered a large and solidly-constructed building of late Greek workmanship, with a front 75ft. long, which may, it is suggested, have been an "Andreion," of the kind in which the Cretan citizen met for common meals. Accounts of the discoveries will be published in the forthcoming number of the annual.

At Knossos Mr. A. Evans had continued the excavation of the great prehistoric palace associated with the legends of Minos and the labyrinth. The northern end of the palace and an extensive eastern quarter had been uncovered during the past year, and before the close of the season a triple flight of stone stairs was found leading down to a suite of halls, showing remains of colonnades and galleries. As it appears that the principal state rooms were on this lower level, it may be hoped that next year will give even better results. Considerable progress, the report stated, had been made with the scheme for establishing a British school at Rome, which had begun work, and the director had written a full report on the recent excavations.

Sir Richard Jebb said, in moving the adoption of the report, that the document justified the opinion that the British School at Athens was continuing to fulfil the purposes for which it was founded.

While Crete had been the chief centre of interest, the year had not been barren of interesting archæological events in other parts of Hellas. One, at least, of them deserved special mention. Professor Furtwängler had made a fresh examination of the temple in Ægina, and had ascertained that it was dedicated not to any of the greater divinities but to a local goddess called Aphaia. The temple was dedicated soon after 490 B.C., replacing an older Doric temple of the sixth century.

The British school aimed at advancing knowledge. It also aimed at educating young archæologists. The school at Athens and the recently-opened school at Rome offered the best facilities available to our countrymen for a practicial training in archæological work. It would be of great advantage to the director if he could command the services of another advanced archæologist—or of more than one such colleague—to assist in conducting excavations and in editing the results for publication. They wanted something in the nature of an archæological fellowship in connection with the school, to be tenable for a certain term of years. The French School of Athens actually possessed much of that character.

Mr. Bosanquet made a statement as to the work of the school during the season, and concluded by announcing that Mr. Marshall had been selected as Director-General of the Archæological Survey of India.

Mr. Penrose moved the following resolution: "That Professor Ernest Gardner, Professor Percy Gardner, Professor Pelham, and Dr. Waldstein be re-elected members of the committee; that Mr. Walter Leaf be re-elected hon. treasurer and Mr. William Loring hon. secretary for the ensuing year, and that Mr. R. Mayor be elected acting hon. secretary until Mr. Loring's return; that Lord Lingen and Sir Frederick Pollock be re-elected auditors, and that Mr. Edwin Waterhouse be elected an additional auditor." This was carried, and the proceedings then ended.

Surveying and Sanitary Notes.

A New Sewage Scheme at Maidstone, on the bacterial principle, has been adopted by the Urban District Council. The scheme will involve an expenditure of between £70,000 and £80,000.

The View from Richmond Hill.—The work of devastation on the Lebanon House estate is proceeding daily, more and more of the fine cedars are being felled, and the portion of the Cambridge House Estate still for sale, on which the beauty of the view from the old bridge depends, is already being cut up for drains, roadmaking, &c. Men are actually at work on the meadow in front of the lovely old elms. The Twickenham District Council have agreed to contribute £3,000 towards the £72,000 necessary for the purchase of the Marble Hill estate.

The Breaking-up of London Streets formed the subject of a discussion at a meeting of the Westminster City Council last week. Finally, resolutions were adopted, on the motion of Mr. Alderman Walter Emden, to the effect that the council was prepared to support the London County Council in obtaining powers more effectually to control the breaking up of the streets by various companies on condition that those powers, when obtained, should be placed in the hands of the local authorities, the London County Council being the body to which appeal could be made in case of dispute between the local authorities and any of the companies. Further, that it should be an instruction to the Law and Parliamentary Committee to consider, and, if thought fit, prepare a short Act of Parliament in regard to the opening and excavating of the roads and streets, so as to enable the Council to regulate better the very serious obstructions at present unfortunately permissible. The Council also resolved that the council of each metropolitan borough, the Common Council of the City of London, and the London County Council should be invited to appoint one or two of their members, and their engineer or surveyor, to attend a conference to be held at the Westminster Town Hall, for the purpose of considering the materials and means of paving the streets of London in a way suitable to the requirements of each district.

Correspondence.

Liverpool Cathedral: A Sidelight from the late Cardinal Newman.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—It appears that there is really need to fight the battle of the styles over again at Liverpool. As a contrast to the utterances of Mr. Robert Gladstone, may I be permitted to quote some words from a letter written by the late Cardinal Newman more than half a century ago? The letter in which these words occur is, I think, very little known, but is of immense interest as showing that Newman, at so early a stage of the Gothic revival, clearly recognised what the profession took many years to learn, and of what Mr. Robert Gladstone seems yet to be quite unconscious. The letter will be found on pp. 205-7, Vol. II., of "The Life of Ambrose Phillipps de Lisle," published last year. Pugin was then asserting in his dogmatic way that Gothic was the only Christian architecture. Phillipps was as enthusiastic in this belief as Pugin himself. But Newman was of a different opinion. Pugin was building (Roman) Catholic churches up and down the kingdom, but would have nothing to do with an Oratory, for reasons that will be seen below. Newman had the courage of his convictions, and spoke out in no uncertain way to Mr. Phillipps. There are several of his letters on this subject of Gothic architecture, but the one in question is dated June 15th, 1848. It is too long to quote in full, but in any future history of the Gothic revival it should not be overlooked.

"Mr Pugin," writes Newman, "is a man of genius; I have the greatest admiration for his talents . . . but he has the great fault of a man of genius, as well as the merit. He is intolerant, and, if I might use a stronger word, a bigot. He sees nothing good in any school of Christian art except that of which he is himself so great an ornament. The canons of Gothic architecture are to him points of faith, and everyone is a heretic who would venture to question them. . .

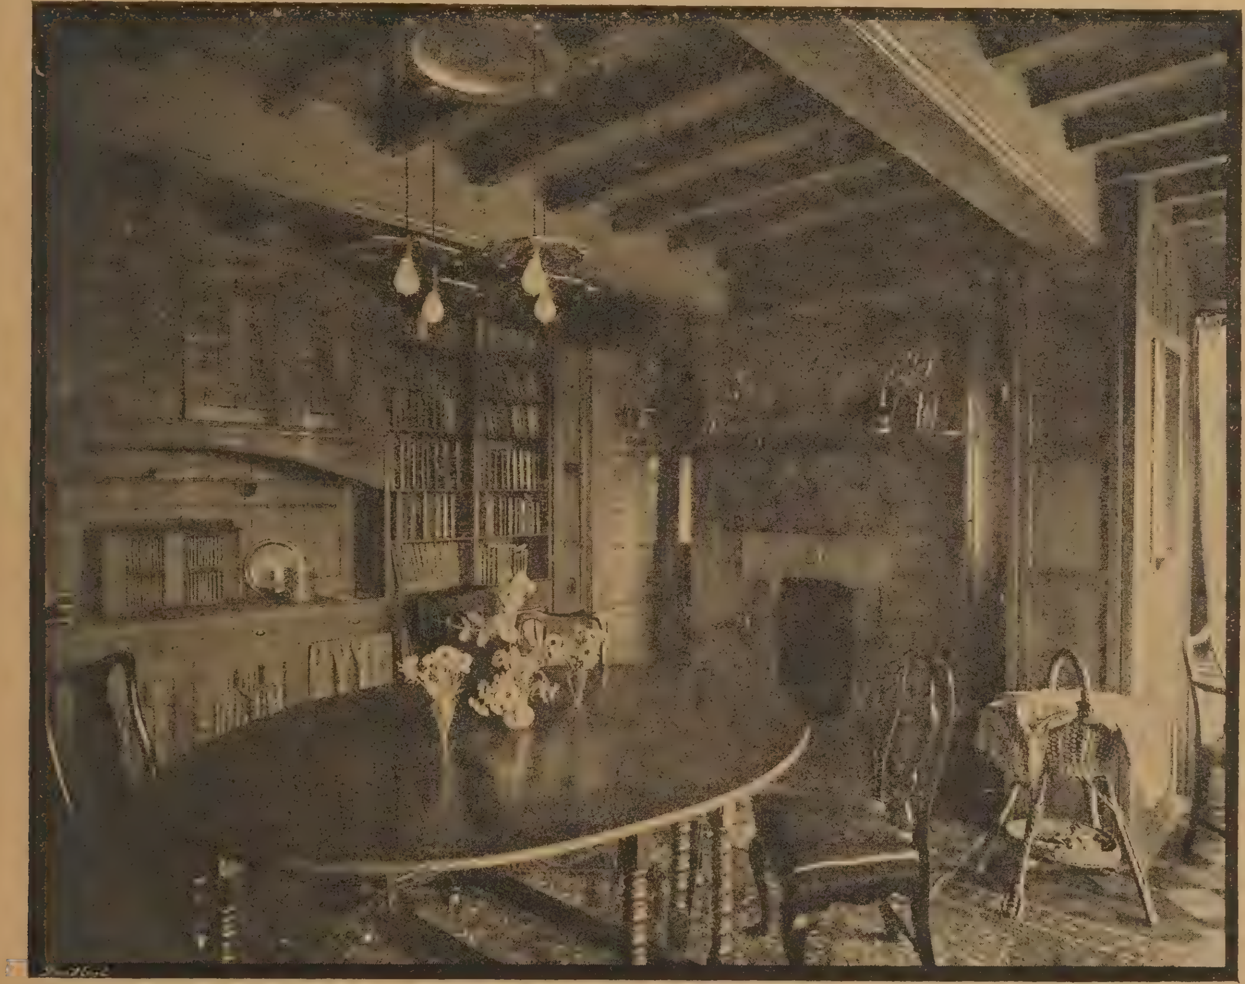
"Now something might be said in defence of this extreme view of the subject, had Gothic architecture prevailed over the *whole* face of the Church. . . . But this is notoriously not so—nevertheless Mr. Pugin, with only half Christendom on his side . . . rules that the other half is, what he calls reproachfully *pagan*. . . .

"Something more might be said for his view of the subject had there been an *uninterrupted tradition* of Gothic architecture from the time it was introduced till the present day; but this even is not the case. Mr. Pugin is notoriously engaged in a revival—he is disentombing what has been hidden for centuries amid corruptions; and, as first one thing and then another is brought to light, he . . . modifies his first views. . .

"But there is even more than this—continues Newman—and what is very important; we know that the Church, while one and the same in doctrine ever, is ever modifying, adapting, varying her discipline and ritual, according to the times. In these respects the Middle Age was not what the First Centuries were—nor is the Age Present the Middle Age. In order, then, that any style of architecture should exactly suit the living ritual of the nineteenth century, it should be the living architecture of the nineteenth century—it should never have died—else, whilst the ritual has changed, the architecture has not kept pace with it. This defect is actually found in the case of Gothic. Gothic is now like an old dress, which fitted a man well twenty years back, but must be altered to fit him now. It was once the perfect expression of the Church's ritual at those places at which it was in use; it is not the perfect expression now. *It must be altered in detail* to become that expression. That is, it must be treated with a freedom which Mr. Pugin will not allow. I wish to wear it, but I wish to alter it, or rather I wish *him* to alter it. *This* is his quarrel with us, not that we do not feel the greatest admiration for the Gothic style, but that we will not allow details which were proper in England in the Middle Ages to be points of faith now." And referring to the immediate point of dispute, the writer adds: "For Oratorians, the birth of the sixteenth century, to assume the architecture simply and unconditionally of the thirteenth, would be as absurd as their putting on them the cowl of the Dominicans, or adopting the tonsure of the Carthusians. We do not want a cloister or a chapter-house, but an Oratory; I, for one, believe the Gothic style can be adapted, developed into the requisitions of an Oratory. Mr. Pugin does not: he implied in conversation with me at Rome that he would as soon build a Mechanics' Institute as an Oratory. I begged him to see the Oratory at the Chiesa Nuova; he gave no hope he would do so. Now is it wonderful that I prefer St. Philip to Mr. Pugin? And is it not wonderful that he should so relentlessly and indissolubly unite the *principles* of his great art with the *details*?"

I have been tempted to quote at some length, as, although every word of the above may not have a direct bearing on the present issue, there is a historic interest in the whole of the letter that must be my excuse for occupying so much of your space. I have only to add that the italics throughout are Newman's own.—Yours truly,

F. H. CHEETHAM.



DINING-ROOM AT "WOODSIDE," CHILWELL, NOTTS. ARTHUR MARSHALL, A.R.I.B.A., ARCHITECT.

"Woodside," Chilwell, Notts.—This is Mr. Arthur Marshall's own house. The dining-room is treated in wainscot oak, and is only 8ft. 6in. high by about 16ft. square. The fireplace recess is lined with dull-green glazed bricks, and the fire-opening has a lintel 2ft. deep of green Irish marble with a projecting shelf. The frieze or panel above is beaten in aluminium. Altogether the effect is unpretentious and good.

Views & Reviews.

Drawing for the Press.

Owing to the increasing demand for illustrated literature of every kind there has arisen a vast school of workers in black and white who form quite a new factor in any estimate of the art of to-day. But, notwithstanding the close attention which has been devoted to the subject, it is undoubtedly true that the majority of these workers do not thoroughly understand the practical limitations of the processes by which their drawings are reproduced; this being doubtless due in large measure (as the author of this book points out) to the fact that the teachers themselves are, as a body, similarly ignorant. And yet such knowledge is emphatically necessary. For instance, an artist who knows that his pen-and-ink sketch is to be reduced considerably will not crowd his lines together so that they become clogged; nor will he forget that the half-tone process tends to give a feeling of flatness, caused by the ruled screen which is employed. Of these and many other matters the writer of this book speaks fully, emphasising his remarks by reference to the numerous illustrations which accompany the letterpress. Specimens of work by such men as Sir John Gilbert, Lancelot Speed, Alfred East, Selwyn Image and Walter Crane are given, in all cases accompanied by some critical remarks which students will find of much interest. The author very properly asserts that "the skilful copies, the facsimiles of engravings and etchings drawn in pen and ink, which are the admiration of the young artist's friends, are of little or no value in deciding the aptitude of the student." He insists that there must be originality as well as care and thought bestowed on every drawing for the press; and in this connection poor Vierge comes in for his share of blame, or rather those who have copied him. Innumerable pen-and-ink artists have formed their style (or a portion of it) on this Spaniard's work, and among them we might name one of the best-known architectural draughtsmen of to-day. The book (which now reaches its third edition) contains many useful hints and should be studied by all illustrators; not the least interesting portion is the chapter on coloured illustration by Mr. J. S. Eland. We might note that, on page 250, J. G. Harper is printed instead of C. G. Harper, and also that the title of Mr. Joseph Pennell's book is not "Pen and Pencil Artists" but "Pen Drawing and Pen Draughtsmen."

"The Art of Illustration." By the late Henry Blackburn. Edinburgh: John Grant, 31, George IV. Bridge price 7s. 6d. nett.

Cretan Archæology.

The recent explorations of ruined cities in Crete have been perhaps the most productive of any during the last few years, and the discoveries already made by Mr. Hogarth and Mr. Evans are entitled to rank as most important contributions to the unravelling of a wonderful and curious civilization, earlier than that of Greece, and yet showing a highly-developed condition. In this book Mr. Evans gives a preliminary study of a branch of the subject, attempting some explanation of the many mystic and religious symbols found, and of the religion and religious ceremonies of the Cretan civilization; and being written by such an acknowledged authority, it is of considerable value, and should be read by all those interested in this subject.

"The Mycenæan Tree and Pillar Cult and its Mediterranean Relations, with Illustrations from Recent Cretan Finds." By Arthur J. Evans, M.A., F.S.A. London: Macmillan & Co., Ltd, price 6s. nett.

The London Building Acts.

A third edition of the late Professor Banister Fletcher's handbook of the London Building Acts has just been published by his sons. The exhaustion of two editions of this work testifies to its value. It is undoubtedly the best book upon the subject. Portions of the work have been rewritten, and the cases which have been decided under the Acts are now brought up to date, abstracts of them being appended to each section to which they refer, so that the interpretation which the Courts have placed upon the working of any particular section is now apparent at a glance. Four new plates have been added, showing the requirements for open spaces in or about buildings, and all revised regulations are inserted up to date. The regulations of the City Corporation with regard to drainage, vaults, areas, hoardings, &c., have also been wisely included.

"The London Building Act, 1894, and Amendment Act, 1898: A Text-book on the Law relating to Building in the Metropolis." By the late Professor Banister Fletcher. Third Edition. Revised by Banister F. Fletcher and H. Phillips Fletcher, Associates R.I.B.A., Fellows S.I. London: B. T. Batsford, 94, High Holborn, W.C., price 6s. 6d.

Engineering Notes.

The New Lighthouse at the Foot of Beachy Head is progressing satisfactorily, though the work, which is accounted one of the great engineering feats of the day, is nothing like near completion. The engineers, however, have accomplished the most difficult portion of their task. The tedious and difficult process of laying a firm foundation, in which an enormous quantity of cement was used, and building the base of the tower, has been accomplished; and now that the workmen are not impeded by the sea, more rapid progress is being made. Huge blocks of granite, many of which weigh over five tons, are being used and conveyed by an overhead cable. The tower has already been carried to a height of 80ft., and is to be 120ft. high. It is anticipated that the work will occupy another year in completion.

A New Tyne Bridge.—The directors of the North-Eastern Railway Company propose to erect another bridge to act as a relief to the now world-famed "High Level" which crosses the Tyne, connecting Gateshead with the city of Newcastle, and which was erected from the designs of Robert Stephenson, and opened for traffic by Queen Victoria in August, 1849. It is understood that preliminary borings have already taken place, and that the necessary land has been acquired. The new structure, which is from the designs of the company's engineer, Mr. C. A. Harrison, of Newcastle, will run from the west end of the Central Railway Station, Newcastle, through a part of the Forth goods' yard, and then curve southward, through a corner of the Forth goods' warehouse, thence proceeding across the Tyne in a southerly direction. The river will be crossed on two psans, resting upon a central pier of granite. Cylinders are to be sunk, and on these the piers will be erected. It is proposed to raise the girders into position from barges in the river, and for this reason a portion in each pier will be left unfinished until all the girders are actually in place. There are five lattice steel girders, each weighing 300 tons, 27ft. in depth and 4ft. 7in. in width. The structure, which is to be for railway purposes only, is to have a width of 49ft. from the centre of one parapet to the centre of the opposite parapet, and will be about 670ft. in length and 110ft. above high-water mark to the highest rail of the bridge. The estimated cost of the undertaking is £477,000.

The Institution of Junior Engineers held its annual general meeting last Friday night at the Westminster Palace Hotel. Mr. Percival Marshall occupied the chair. The secretary, Mr. Walter T. Dunn, read the annual report of the council, which stated that the total membership at the close of the session was 652, as compared with 594 for the previous year, an increase of 58. The number of elections had been 103, which was the largest figure yet recorded. During the year the deaths had taken place of Professor G. F. Fitzgerald, an honorary member, Mr. L. F. Awde, a member of the council, and Mr. E. H. S. Cooper. The institution premium had been gained by Mr. Samuel Cutler, junr.; and a special prize offered by Mr. W. H. Northcott for a paper dealing with the relations of employers and employed had been awarded to Mr. Willian Powrie. New offices had been taken at 39, Victoria Street, Westminster, where the accommodation included a library and reading- and writing-rooms. Sir John Jackson had consented to serve as president of the institution. The income for the past year had amounted to £495 7s. 7d., and the expenditure to £475 0s. 1d., leaving a credit balance on the year's working of £20 7s. 6d. The balance-sheet showed a balance of £150 9s. 10d. in favour of the institution. The report and statement of accounts were adopted. The following officers were elected: Chairman, Mr. Percival Marshall; vice-chairman, Mr. Kenneth Gray; hon. librarian, Mr. Lewis H. Rugg; hon. auditors, Mr. H. B. Vorley and Mr. W. H. de Ritter; secretary and treasurer, Mr. W. T. Dunn. On the proposition of Mr. P. J. Waldram, seconded by Mr. A. H. Tyler, a motion was passed authorizing the council to make arrangements to further the speedy exchange of technical information between the members themselves and between the members and the discussion section of the Architectural Association.

Builders' Notes.

Examinations of the Worshipful Company of Carpenters in sanitary building construction will be held on November 21st and 23rd, and not as advertised in our issue of October 9th.

Subsidence of Foundations.—Last week the Marylebone Board of Guardians had under consideration the report of the expert appointed by the Royal Institute of British Architects to enquire into the recent subsidence of part of the foundations of the new workhouse in Marylebone Road. "The cause of the subsidence," says the report, "is rather difficult to determine, but excavations have revealed a layer of watery sand at a depth of 17ft., overlaid by a layer of clay. This, together with the vibration from the heavy coal trains on the Underground Railway which run during the night, is probably the cause of the trouble. Should the cracks reappear and show signs of spreading, it would be advisable to consider the question of underpinning."

Collapse of a Building near Cardiff.—A riding school at Druidstone, near Cardiff, collapsed last week. The building was a large wooden structure on the point of completion, and erected at a cost of about £800 by Mr. Herbert B. Cory. About a score of workmen were engaged inside boarding the walls, while some of Mr. Cory's own men were ploughing up the floor when the accident occurred. Mr. Cory and his manager, Mr. Balfour, directed their attention to extricating the injured men. The case of William Pearce, carpenter, proved fatal. Among the most seriously injured was a lad named Spooner, who had only begun to learn his trade that week. The accident is attributed to the giving way of one of the girders.

Death by Accident.—Edwin John Aston, twenty-two years of age, a mason living near the Speech House, was engaged last Saturday week at Howbeach, near Blakeney, pulling down some old colliery buildings, with the materials from which masons were rebuilding a culvert, when two tons of stonework fell, a considerable portion of which struck Aston so severely that he died a few minutes afterwards. It appears that deceased had no instructions to dismantle the building, his orders being merely to get sufficient stone to keep the masons going. At the inquest Mr. Philip Baylis, deputy surveyor, of Dean Forest, said no one imagined that deceased would have pulled the building down when there was plenty of other stone more easily obtainable.

London County Council.—At last week's meeting of the Council a discussion arose on the recommendation of the Highways Committee relative to combined action by the Metropolitan authorities in regard to street upheavals. Mr. Emden moved as an amendment that the following words be inserted at the end of the recommendation: "And as to whether they are prepared to join in a conference to consider the question of a system of subways in London." This was agreed to. Mr. Emden maintained that they would never get their roads into a proper condition until subways were provided.—Replying to Mr. Burns, M.P., Mr. Waterlow said it was a fact that three blocks only of the houses on Reid's Brewery site were to be erected by the Works Department, and that the other three would be carried out by contractors. The Committee felt that it would afford some comparison between the methods of the Works Department and contractors.—A motion was passed referring to the Parks Committee and the Highway Committee the consideration of a proposal to provide kiosks, &c., on the Embankment.—A proposal to erect electrically-worked clocks in all the principal thoroughfares of the Metropolis was rejected.

Bricks and Mortar.

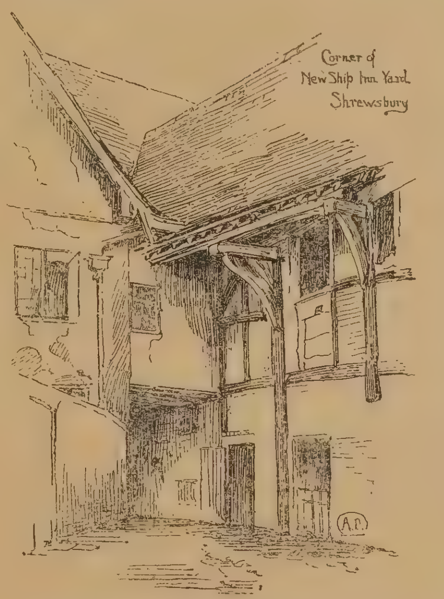
APHORISM FOR THE WEEK.

The art which is grand and yet simple is that which presupposes the greatest elevation both in artist and in public.—AMIEL.

Our Plates. THE illustrations given show the entrance and garden fronts of Cowley Manor, Gloucestershire, as they will appear when the extensive alterations and additions now in course of construction are completed. The small plan shows what these alterations and additions are—the walls which are hatched showing the existing work, and the walls which are in black showing the new work. It will therefore be seen that the new work is simply a continuation of the design of the old. The ashlar work is of Birdlip, and the dressings are of Hollington stone. The new dining- and billiard-rooms will have mahogany panelling, mantelpieces and doors, &c., and enriched ceilings. The general contractors are Messrs. J. Parnell & Son, of Rugby, and the architect, under whose superintendence the work is being carried out, is Mr. R. A. Briggs, F.R.I.B.A., of 12, Norfolk Street, Strand.

Cities of To-morrow. THE visit paid recently to Bournville by Lord Rosebery serves to call renewed attention to the results of the recent conference of the Garden City Association held in Birmingham. The extraordinary unanimity with which the resolutions submitted were passed, and the cordial sympathy which has since been expressed in the movement, are regarded by the promoters of the movement as so satisfactory that the executive has determined to lose no time in taking such provisional steps as are necessary to bring the Association's proposals to a definite issue. It is recognised that the provision of a suitable site is essential to the success of the enterprise, but expert advice is necessary in investigating the respective merits of various estates; and as for all purposes funds are required, an appeal is now being made for such, the result of which should prove satisfactory. There can be no doubt about the urgency of the question; and since it would be possible—as Dr. Mansfield Robinson, town clerk of Shoreditch, stated at the conference—for public bodies to assist in the development of an estate when acquired, the Committee of the Association have additional reason to push forward their proposals to a practical issue. The Association has been invited by the Coventry section of the Co-operative Union, Ltd., to hold a joint conference at Coventry on November 9th next, when Mr. Aneurin Williams, president of the Labour Association, will read a paper on the relation between co-operation and garden cities. This is the first conference arranged between the Garden City Association and the Co-operators, but in view of the interest which the latter are taking in the new scheme many other such meetings are likely to follow. The public interest which has been awakened in the Association's proposals is further indicated by the fact that there has been a considerable run on Mr. E. Howard's book "To-morrow," the first edition of 3,000 being now exhausted. Mr. Howard is now busy revising the MS. of a new edition, which will be issued in a few weeks, with some important additions, under the title of "Garden Cities of To-morrow."

Methley Church Restored. THE ancient parish church of Methley, which has been undergoing restoration, was reopened recently. The foundations have been underpinned throughout, the spire has been rebuilt on the original lines, the tower carefully repaired, the two western buttresses (which had cracked away from the building) have been rebuilt from the foundations, the west door has been opened out, the bells have been quarter-turned and hung on a new frame, and a lightning conductor fixed. The interior walls of tower, nave, aisle and chancel have been stripped of paint and the post-Reformation plaster; the stonework pointed; an ancient recess—for a holy water stoup—at the south door, another behind the pulpit, and the reveal of an ancient window in the north wall, showing traces of wall painting, have been uncovered; and recesses have been constructed in the walls for two ancient recumbent effigies. The ancient figure of St. Oswald, formerly over the south porch, which has suffered very seriously from the weather during recent years, has been built into the east wall of the church. The floor of the nave has been restored to its ancient level; a new floor of tiles and wood blocks, resting on a solid bed of cement-concrete, has been laid throughout the church; arrangements have been made for the inspection—by means of trap doors in the floor—of the ancient foundations discovered at the west end of the nave. The ancient font has been brought back from a hen-run, and its shaft from a mason's yard, and the font, canopy, lectern and pulpit restored. The ruinous "excrescence" against the north wall of the chancel has been removed, and a temporary vestry and organ chamber constructed. A permanent arcade on the north side of the chancel has been built. An ancient corbel, found during the work, has been built into the wall of the arcade. A new heating apparatus has been fixed, and the church is newly lighted throughout with the incandescent light. The cost will exceed £3,000. The restoration of the interior, and the erection of a new vestry and organ chamber—which is estimated to cost an additional £1,863—has yet to be carried out. Messrs. H. A. Prothero and G. H. Phillott, of London, are the architects.



Shrewsbury's Old Houses. SHREWSBURY is full of interesting buildings, but to find them out one must stay some time in the town. Hidden away amid the most unpromising slums are the remains of the old town mansions of the wealthy. For Shrewsbury in days gone by had its winter season of gaiety, to which the county squires brought their wives and families; and many are the houses now divided up which still bear the names of their proud owners, such as Ireland's Mansions, Rowley's Mansion, and many others. Fallen from their past grandeur, some have been turned into warehouses, others accommodate the poorest of the poor, whose children scramble up and down the old oak stairs. The yard of the "New Ship" inn is surrounded by buildings of this class, a jumble of brick, stone and half-timber dwellings. The sketch is by Mr. A. Durst.

Sheffield Society of Architects. THE annual dinner of the Sheffield Society of Architects and Surveyors was held recently. The chair was taken by Mr. Peter Marshall (president). Mr. Thomas Winder, in proposing "The Lord Mayor and Corporation," said it was gratifying to note how successful some of the Corporation's undertakings were proving. The tramways were showing a profit which bade fair to make Sheffield no longer the most highly rated city in the country. The waterworks this year showed a profit equal to three times the sum at which they were offered to the town in 1767. He was afraid that the popular cry for artisan dwellings had thrown all off the scent of the real and crying need of Sheffield, not for expensive dwellings for the highly-paid artisan, but for homes for the very poor, who were being evicted from crowded thoroughfares before other homes were provided for them. The Lord Mayor (Alderman J. Eaton) responded. Mr. E. Holmes, in proposing "The Royal Institute of British Architects and The Surveyors' Institution," spoke of the endeavours both were making to advance the position and recognition of the members by increasing the education of the younger members. This was responded to by Mr. J. Smith for the former and Mr. R. W. Fowler for the latter society. Mr. C. Hadfield proposed "The City and Trade of Sheffield," and Mr. A. R. Ellin (master-cutler) responded. Mr. A. W. Warner proposed "The Sheffield Society of Architects and Surveyors." He had received a report of the society, and found it was a very strong one, with 111 members. It had gone through a good year's work. It afforded excellent facilities for advancing its younger members, and protecting all members as far as possible against injustice, misappropriation of powers and the vagaries of Corporation committees. Mr. P. Marshall (president), in responding, also touched on the strength and educational work of the society. He said that arrangements had been made for lectures on November 4th by Mr. C. F. Brindley, on "Organ cases and organ chambers"; on December 12th, by Mr. A. Jeffery, on "Stained glass"; next year, on January 9th, by Mr. W. Watts, F.G.S., on "Concrete and its uses"; on February 14th, by Mr. C. Hadfield, F.R.I.B.A., on "True building"; and on March 14th, by Mr. T. G. Jackson, R.A.

Admiralty Works Department. SOME important changes have just been made in the Head Office Staff of the Admiralty Works Department. This Department is responsible for the design and construction of all engineering and architectural works at the naval establishments at home and abroad, as well as for their care and maintenance. These works include docks, wharves, slips, breakwaters, dredging, barracks, hospitals, magazines, stores, workshops, dwellings, drainage, lighting and water supply, &c. The care and management of Admiralty lands and property is also dealt with in this Department. The increase of the Fleet during recent years has necessitated a corresponding growth in the shore establishments, and this has involved a large increase in the staff of the Works Department. With the changes lately made the authorised permanent staff of the Department under the Director of Works is as follows: Two assistant directors of work, from £850 to £1,000 a year (with an addition of £200 a year to the senior). Engineering Staff.—Eleven superintending civil engineers, from £600 to £700 a year; twelve civil engineers, from £400 to £500 a year; twenty-two assistant civil engineers, first grade, from £300 to £400 a year; twenty-one assistant civil engineers, second grade, from £180 to £300 a year. Surveying Staff.—One chief surveyor, fram £800 to £1,000 a year; six surveyors, from £400 to £500 a year; ten assistant surveyors, first grade, from £250 to £350 a year; nine assistant surveyors, second grade, from £125 to £250 a year; one surveyor of lands, from £600 to £800 a year; one surveyor of coastguard buildings, from £500 to £700 a year; one clerk of works for ditto, from £215 to £300 a year. Many of these appointments carry in addition a house, London or Colonial allowance. Entries to the staff are made in the lowest grades—viz., assistant civil engineer, second grade, or assistant surveyor, second grade—by open competitive examination held by the Civil Service Commissioners. The limits of age at entry are twenty-three to twenty-eight for the assistant civil engineers, and twenty-three to thirty for the assistant surveyors. Promotions are made by selection as vacancies occur, through the successive grades up to senior assistant director of works and chief surveyor respectively. All officers of the staff are liable for duty either in London, at home stations or at stations abroad. Full particulars of the subjects and conditions of examination are obtainable at the Civil Service Commission, 68, Victoria Street, London, S.W., and notice of coming examinations are given by public advertisement. There are likely to be examinations for entry in both branches before long.

Keystones.

Etchings of Windsor Castle and Buckingham Palace by Mr. Hermann Haig have been accepted by his Majesty the King.

A New School at Craigellachie has been erected. Messrs. Brown & Watt, Aberdeen, were the architects.

Birmingham University's New Buildings will be commenced shortly. The Council of the University has authorised the preparation of plans for the necessary buildings estimated to cost £200,000.

The Largest Warehouse.—Liverpool has the the biggest warehouse in the world. It is built beside the docks, and is intended to house the imports of tobacco which form so important a part of Liverpool's trade. The warehouse is 725½ft. in length, 165ft. wide and 124ft. 10in. high. The ground area is 13,300 sq. yds. and the area of the several floors 174,098 sq. yds.

In the Chapel of the Hopital Cazin-Perrocheau of the Franciscan Sisters of Berch-Plage a number of frescoes of the Way of the Cross have been painted by Albert Besnard, and statues of the Virgin, St. Elizabeth, and St. Francis, executed by Madame Besnard. For some years this talented couple, actuated by sentiments of religion, humanity and gratitude for the deliverance from death of their son, have been associated in creating these monuments.

In honour of M. Bénard, the architect (of Compiègne, and former Grand Prix de Rome), and of the distinction he has gained in the international competition of architects for the design of the future University of California, M. Roti has produced an artistic *plaquette*. On one side of the souvenir is a profile portrait of Mme. Phœbe Hearst, the American millionaire and generous promoter of the scheme. On the reverse side are engraved portraits of the five members of the jury and a plan of the Californian University.

A Monument in Memory of the Emperor Frederic II. is proposed to be erected at Cologne. It appears that the project was taken up with enthusiasm, £6,520 were collected, and sculptors were invited to compete for the honour of executing the memorial. Finally Herr Albermann, a local artist of great merit, was selected to carry out the scheme. He was already setting about his work when the Emperor William objected to the design on the ground that his father was represented on foot. A new competition was arranged. Herr Albermann now submitted an equestrian figure, which was approved by the committee. Again the Emperor objected. His Majesty considered that a Berlin sculptor should have been charged with the task. The committee, on their side, thought that the Berlin artist should have submitted his claims in the ordinary course of the competition, but as argument is impossible in the circumstances they have tendered their resignation.

The Hall of the Cordwainers' Company, situated on the north side of Cannon Street, has during the last few months had extensive decorative works executed to it. The decorations of the large hall on the first floor, and the lower hall and court-room on the ground floor, were originally executed in the Adams style, but, beyond simple friezes, the walls and ceilings were left with plain surfaces. The lower hall and the court-room ceilings have now been decorated with Adams plasterwork, and have had a selected series of oval medallions fixed to the walls, thus breaking up their bareness underneath the enriched frieze which already existed. An Adams dado has been fixed in enriched material round the two rooms, and the whole of the rooms have been decorated throughout in a rich buff colour, relieved and picked out with gold. Both the new ceilings have also been gilded in their enriched portions. The ceilings have been supplied and fixed by Messrs. Jackson & Sons, of Rathbone Place, the painting and gilding works being executed by Messrs. Colls & Sons, of Coleman Street. The whole of the works have been designed and carried out under the personal directions of Mr. Howard Chatfeild Clarke of Bishopsgate Street Within, E.C., the company's surveyor.

The New Gaiety Theatre.—Mr. Henry Lovatt, builder, of Darlington Street, Wolverhampton, has obtained the contract for the re-building of the Gaiety Theatre, Strand, London. The cost will be about £50,000.

At the Launch of the Cruiser "King Alfred" at Barrow-in-Furness last Monday the committee of the recent King Alfred celebrations at Winchester was represented, at the invitation of the Admiralty, by Messrs. N. C. H. Nisbett, A.R.I.B.A., and H. A. White, hon. secretaries. The new vessel will be the largest and fastest cruiser in the world.

"Western Cornish Churches" formed the subject of a lecture by Mr. J. D. Enys, F.G.S., delivered to the Plymouth Institution last week. Many of their most interesting features and peculiarities, including ancient doorways, fonts, windows towers, crosses, rood screens, carved bench ends and frescos, and the remains of Norman work and the lack of chancel arch, and absence of clearstory and chancel, were referred to.

The restored Lady Chapel of St. David's Cathedral was dedicated last week by the bishop of the diocese. The ceiling of the Lady Chapel collapsed 130 years ago. The work of restoration has cost £2,500. The chapel had to be practically reconstructed, and the ante-chapel has also been paved and repaired according to plans by Mr. John Oldrid Scott, who succeeded his father, the late Sir Gilbert Scott, as the cathedral architect. Both chapels are attributed to Bishop David Martin (1290–1328), the fifty-ninth bishop in direct line from St. David.

Suicide of a Leeds Architect.—An inquest was held last week at the Black Swan Hotel, Harrogate, touching the death of George Alfred Thrustle (50), architect, who lodged at Westmoreland House, Harrogate, and was found dead in his rooms, with his throat cut, on Tuesday night last week. G H. Thrustle, traveller, of Leeds, son of the deceased, said his father had never been the same since his wife died five years ago, and he had also had financial troubles. Three months ago his father had a slight attack of rheumatic fever, through living in a damp house, at Leeds.

A Berwick Competition.—The Berwick School Board have selected the design submitted by Mr. J. Landell Nicholson and Mr. Frederick E. Dotchin, as joint architects, of Newcastle-upon-Tyne, for their new infants' school, caretaker's house, playsheds, &c. It was an open competition, and altogether thirty-one sets of plans were submitted. Mr. Nicholson was also successful eighteen months ago in obtaining, in open competition, the appointment for carrying out the erection of new schools at Kelvin Grove, Gateshead, for the Gateshead School Board, which give accommodation for 1,500 children.

A New Pupil Teachers' Centre at Coventry has been erected at the corner of Wheatley Street and Fairfax Street, of pressed bricks, terra-cotta dressings, with bands of granolithic stone occasionally. The building will accommodate about 120 pupils, and consists mainly of a hall, divided by a folding screen into two portions. There are two small classrooms. There is also a small room for the master, and of course cloakroom and other accommodation. The cost of the building has been about £2,100. Messrs. G. & I. Steane were the architects, and Mr. Charles Heywood was the builder.

The Liverpool Architectural Society met last week, when a paper on "Cheap Dwellings" was read by Mr. Fletcher T. Turton. He alluded to the recent conference on the subject of cheap dwellings at Glasgow, which he had attended, and said that the term "cheap dwellings" had a dual meaning—it might signify a dwelling let absolutely below its letting value; or it might be a house which was cheap in style. While in Liverpool they had been twitted with building too many two-roomed tenements, in Glasgow, out of 2,000 cheap houses, more than one quarter were only single rooms and more than half had only two apartments. In Liverpool there were some 800 tenements already built, and there were in erection, or about to be erected, some 800 more. They had found that a one-roomed tenement provided a considerable amount of necessary accommodation; Liverpool had done more towards housing the very poor than any other town or city in the United Kingdom.

The New Offices of the Gloucester Liberal Benefit Society in Barton Street, Gloucester, were opened recently. Mr. Harry B. Guest is the architect, and Messrs. Freeman & Jones were the contractors.

Society of Architects October Examination.—The following have passed the qualifying examination and are eligible to apply for membership: Arthur Lawrence Cox, of Folkestone, and Reginald G. Kirkly, of Sunderland.

A Statue of Oliver Cromwell at St. Ives, Hunts, was unveiled last week. It is erected in the Market Place, is of bronze and 8ft. in height, standing on an 8ft. pedestal of Portland stone. The base is of granite with four corner blocks surmounted by gas standards.

Newlands U.F. Church, Glasgow, is being erected at the corner of Langside Road and Riverside Road. The new church will have sitting accommodation for 800 persons. It is cruciform in plan, with nave, transepts, and choir recess. The style is fifteenth-century Gothic, the corner porch being so constructed that it can be continued into a tower at any future time if required. Large aisle arches, with octagonal freestone piers, will form a feature of the interior, while the roof timbers will be exposed so as to show an open timber hammer-beam roof. Giffnock stone will be employed for the exterior, and Auchenheath material for the inside stonework.

Improvements at Rhyl.—Mr. C. J. Richardson, architect, of Poulton, is preparing plans for the rebuilding of the property from the Queen's Hotel on the Rhyl Parade, to Sussex Street, on which it is intended to erect a magnificent arcade and ballroom, and ultimately reconstruct the Queen's Hotel. The arcade will have a frontage to the Promenade of 48ft. and to Sussex Street of 70ft., and its total length from the Promenade to Sussex Street will be 320ft. It will contain forty-one shops, varying in size. The pavilion or ballroom will be at the Sussex Street end of the arcade, and will have entrances from the promenade, the arcade, as well as a principal entrance from Sussex Street. A raised platform will surround the dancing floor, which will be laid on about 1,500 spiral springs. This floor will measure 95ft. by 55ft. Above the ballroom will be a large balcony, and a large stage will be erected.

The Memorial Stone of the New Municipal Buildings and Law Courts at Cardiff was laid last week by the Marquis of Bute. The buildings are to cost £233,000, and are being erected on the Cathays Park, a 60 acre tract, which was sold to the corporation by the late Marquis of Bute for £160,000, the vendor stipulating that none but municipal and educational buildings should find a place thereon. Sites have also been allocated for University College buildings, museum and art gallery, board school offices, technical schools and intermediate school for boys, and recreation ground, and there is likelihood of a very fine group of buildings being completed within a few years. The Cathays Park is contiguous to the castle, and therefore situate in the centre of the town, and with a liberal provision of broad avenues, lined by stately old trees, the approaches to the proposed public offices, municipal and educational, will afford picturesque accessibility.

Instability at Truro Cathedral.—The Truro Cathedral Building Committee reported to the Diocesan Conference last week that serious anxiety and painful disappointment had been caused by signs of fracture in eight of the Bath-stone bases of the nave piers. Investigation showed that there was nothing to indicate anything amiss with the foundations, or any settlement of the building, and the architect had reported that it was clearly a case of imperfect bedding. The committee added that the cracked stones could be replaced, if necessary, by a very costly and possibly dangerous process involving the underpinning of the arcades. But before undertaking so serious an operation they had decided, with the concurrence of the architect and contractor, to invite some thoroughly competent architectural expert to inspect the building and advise the committee thereon. The building committee has in hand a surplus of £2,871. A resolution was passed expressing a desire that the architect, Mr. J. L. Pearson, might pay more frequent visits to the cathedral.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Concrete under Buildings.

SHROPSHIRE.—CONCRETE writes: "I append by-laws relating to covering the surface of the ground under a domestic building with concrete, taken respectively from the 'rural' and 'urban' sanitary authorities of this district. I have three new buildings ready to commence, but the rural council will not pass the plans unless my clients will put in the concrete bed, in accordance with the by-laws. In all three cases the sites are perfectly dry; two are beds of pure red sand, and the other gravel to a depth of 8ft. or 9ft. It seems to me a most unreasonable stipulation, and I shall be glad to know whether the council can absolutely enforce it, or whether my clients would be wise in opposing it to the extent of proceeding with the work. The by-law of the rural sanitary authority is as follows: 'Every person who shall erect a new domestic building shall cause the whole ground surface or site of such building to be properly asphalted or covered with a layer of good cement-concrete, rammed solid, at least 6in. thick.' The by-law of the urban sanitary authority is as follows: 'Every person who shall erect a domestic building shall cause the whole ground surface or site of such building to be properly asphalted or covered with a layer of good cement-concrete, at least 6in. thick, whenever the dampness of the site renders such a precaution necessary.'"

It is considered that the council can enforce the provisions of the by-law, and it would be better to incur the slight extra expense of concreting over the area rather than contest the point. From a sanitary standpoint, it is undoubtedly desirable that the area of ground enclosed by a building intended for domestic occupation should be covered with a layer of concrete or other impervious material, so as to prevent any rising of ground-air or other vapours when the building is inhabited. T. E. C.

Load on Roof Trusses.

BRISTOL.—QUERIST writes: "Referring to the reply to 'D' on p. 78 of your issue for September 11th, is the practice of taking a vertical component of 56lbs. to the sq. ft. for roof covering, wind, &c., to be commended for all types of roofs? Is it adopted in general office practice, and would it include the weight of the truss in the case of a steel structure?"

A vertical component of ½ cwt. per sq. ft. of actual roof surface for the external and structural loads is generally sufficient to cover all contingencies for straight rafter roofs of ordinary construction and pitch, but for curved trusses it is necessary to take account of the horizontal action of the wind separately from the structural load. HENRY ADAMS.

Injunction for Damage to Adjoining Premises.

SOUTHEND-ON-SEA.—SCOTT writes: "The owner of some land has just built a factory. The adjoining owner has excavated a large hole to obtain sand. This hole is about 25ft. deep, and it is feared that the dredging for sand will cause a settlement in the factory, as the water-line is about 17ft. below the ground-line and consequently the sand must percolate from the owner's land into the adjoining owner's sand-pit. Can the owner obtain an injunction to prohibit the hole being made larger before any damage is done, or must he wait until damage is done and then sue for damages?"

You can obtain an injunction if you can prove that damage is being caused. If, however, the neighbouring owner is only pumping water from your land he cannot be stopped, as water flowing in unknown channels is the property of the finder.

Cement-Concrete Tank.

ALDERSHOT.—F. M. P. writes: "Is a cement-concrete wall of a tank 96ft. by 52ft., designed as per sketch (not reproduced), strong enough? The wall is to be 7ft. high, and will stand 1ft. above the ground on the outside and 1ft. above the water-level inside. (2) If the tank is to be divided lengthwise into two tanks 96ft. by 26ft., what should be the dimensions of the division wall?"

(1) Yes. (2) 3ft. thick.

Conversion of Concentrated into Equivalent Distributed Loads.

BRIGHTON.—STOCK SECTIONS writes: "Is there any method of reducing the load on an unsymmetrically-loaded girder to its equivalent as an evenly-distributed load, so as to enable a choice to be readily made from a maker's list, making use of the loads as indicated therein? I have to select a girder of 20ft. span to carry two loads of 6 tons and 8 tons, 5ft. and 13ft. respectively distant from the *same* end, in addition to a distributed load of 12 tons. How could the girder be selected having only the above-mentioned list as a guide?"

Referring to the accompanying illustration, let A B be the girder loaded as shown. The concentrated load can be converted into equivalent distributed loads (*i.e.*, loads to produce the same maximum stress) as follows:—

Reactions from concentrated loads,

$$\text{At A} = \frac{6(8+7)}{20} + \frac{8(7)}{20} = 7{\cdot}3 \text{ tons}$$

$$\text{B} = \frac{8(8+5)}{20} + \frac{6(5)}{20} = 6{\cdot}7 \text{ tons.}$$

$$6 + 8 = \text{total} \quad 14{\cdot}0 \text{ tons.}$$

Bending moments from concentrated loads,

Under the 6-ton load $= 7{\cdot}3\ (5) = 36{\cdot}5$ft. tons.

„ 8 „ $= 7{\cdot}3\ (5) = 8 - 6(8) = 46{\cdot}9$ tons.

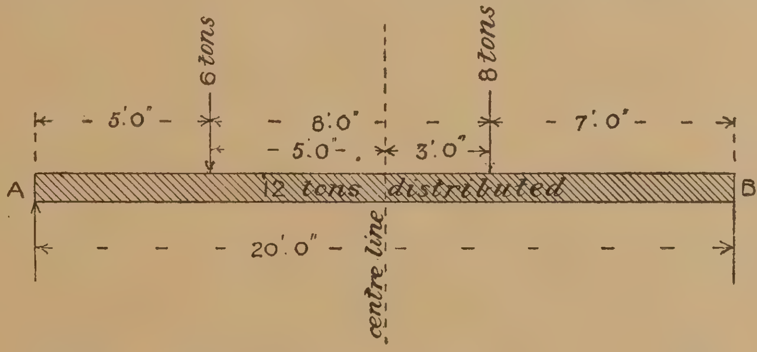
or, working the other way round as a check,

under the 6-ton load $= 6{\cdot}7\ (7+8) - 8(8) = 36{\cdot}5$ft. tons.

„ 8 „ $= 6{\cdot}7\ (7) = 46{\cdot}9$ft. tons.

and in the centre of span,

$$\tfrac{5}{8}\ (46{\cdot}9 - 36{\cdot}5) + 36{\cdot}5 = 43\text{ft. tons.}$$



CONVERSION OF CONCENTRATED INTO EQUIVALENT DISTRIBUTED LOADS.

Bending moment from distributed load,

$$\text{in centre} = \frac{\text{W}l}{8} = \frac{12 \times 20}{8} = 30\text{ft. tons.}$$

$$\text{or checked by leverage } \frac{12}{2}(10) - \frac{10}{20} \text{ of } 12\ (5) = 30\text{ft. tons.}$$

$$\text{and under 8-ton load} = \frac{12}{2}\ (7) - \frac{7}{20}(12)\frac{7}{2} = 27{\cdot}3\text{ft. tons.}$$

Total bending moment in centre $= 43 + 30 = 73$ft. tons.

„ „ under 8 ton load $= 46{\cdot}9 + 27{\cdot}3 = 74{\cdot}2$ft. tons

so that the greatest bending moment will occur under the 8-ton load, and it will be necessary now to find what uniformly distributed load would produce the same maximum bending moment.

$$\frac{\text{W}l}{8} = 74{\cdot}2, \text{ or } \frac{\text{W} \times 20}{8} = 74{\cdot}2,$$

$$\text{whence W} = \frac{74{\cdot}2 \times 8}{20} = 29{\cdot}68, \text{ say 30 tons.}$$

Referring to Dorman, Long & Co.'s catalogue, we find that a 16 × 6 × 62lbs. R.S.J. would be sufficient with a factor of safety of 3, or an 18 × 7 × 75lbs. R.S.J. with a factor of safety of 4. HENRY ADAMS.

Modern Schools of Art.

HULL.—STUDENT writes: "Where can I see the most up-to-date School of Art building?"

The new Liverpool School of Art, by Edward W. Mountford, is perhaps the most complete and most modern, but that at Bury (Woodhouse & Willoughby, architects) is a very good model.

Concrete Floor for Kitchen.

LIMERICK.—W. W. I. writes: "A kitchen on the first floor of a building is 28ft. by 12ft., and I propose to put in steel railway rails 4ft. apart crossways, and to erect a temporary staging or floor flush with the bottom of the rails, filling in with breeze-concrete 4½in. thick to the top, and tiling. In what proportion would you mix the concrete?"

We would not advise the rails being placed more than 3ft. apart. The concrete should be 6in. thick, thus getting a double bearing on bottom and top flanges. In other respects your method is the cheapest, and is satisfactory. The floor need not be bonded into the walls, as these will give the needed support along the sides, but at the ends corbels under the floor or short pieces of girders, railway metals, or T-irons, bonded the walls and concrete, might be used. The concrete would be best at 3 of sharp aggregate to 1 of cement. The staging or centering should remain up at least a week, and when removing it care should be taken not to jar and break the key of the floor.

Books of Villa Residences.

ST. IVES.—W. F. writes: "Can you mention a book or two of drawings of villa residences, showing elevations and rough plans?"

"Bungalows and Country Residences," by R. A. Briggs (10s. 6d.); "Country Homes" (15s. nett); "New Cottage Homes and Details," by Messrs. Palliser (15s.). These can be obtained from Mr. B. T. Batsford, of 94, High Holborn, W.C.

Strength of Bath Stone Columns.

MALVERN.—X. Y. Z. writes: "I am about to erect a nave arcade in a chapel with gallery round. If Bath stone is used for columns of 18in. diameter, will it be strong enough? At 7ft. 3in. from the floor I want the columns to support the bearers for the gallery floor. Will it weaken them too much if they are let into the columns, and would it be advisable to put a different stone at this point? Should the square brick base under columns be calculated at twice the diameter of the column? If so, this would make the concrete base 6ft. sq. Is not this more than necessary?"

The crushing weight on Bath stone (Box Ground) is given in "Notes on Building Construction" Vol. III. as ·66 tons per sq. in. and Portland stone average 1·6 tons per sq. in. Portland stone in ashlar work is safe with a working load of 15 tons per sq. ft., therefore Bath would be safe with $15 \times \frac{{\cdot}66}{1{\cdot}6} =$ say 6 tons per sq. ft. reduced according to height of pier as follows:—

W = tons per ft. sup. as given above.

r = ratio of height to least diameter.

$$\text{Safe load on pier tons per sq. ft.} = \frac{24\text{W} - \text{W}r}{18}.$$

or it may be calculated by Gordon's formula. Letting bearers into the sides of a column or pier weakens it by the amount cut away and also produces a greatly increased stress if these side loads are not symmetrical, *i.e.* a load on one side balanced by an equal load on the other side. For the effect of non-axial loads on columns see "Designing Ironwork, 2nd Series, Part II.," pp. 34–39 (Spon, 2s. 6d.). If the base is brickwork in mortar, it should be covered by a stone large enough to reduce the pressure to 4 tons per sq. ft. and the footings should be such that with an extra width of 6in. all round the concrete may not press on the soil with more than 1½ tons per sq. ft. average; on hard gravel it may be double and on light soil half. HENRY ADAMS.

BUILDING CONSTRUCTION.

(*Continued from p.* 187 *of No.* 350.)

24 (*Additional Note*).—Referring to Fig. 22, let A B C D be a cross-sectional slice 1in. thick of a round pipe carrying water at *p* lbs. pressure per sq. in. Suppose the water to become solid, all except a small passage A C passing through the centre having parallel plane sides at right angles to the paper: the water in this space presses D and B apart with the force $2Rp$, but D and B are prevented from moving apart by the portions of hoop at A and C, and the pressure on one portion is, therefore, Rp as before. If we suppose an annular joint in the pipe, the force applied to it is the pressure on the section A B C D, that is πR^2, the circumference of the ring is $2\pi R$ ∴ the stress per linear inch is $\frac{p\pi R^2}{2\pi R} = \frac{Rp}{2}$. If the pipe has dead ends, it presents no difficulty to think of its being stressed longitudinally, but it takes some little effort of the imagination to become possessed of the idea as put above: either the pipe has what are equivalent to dead ends somewhere, and the water is statical, or we have to conceive the water taking hold of the pipe by its friction.

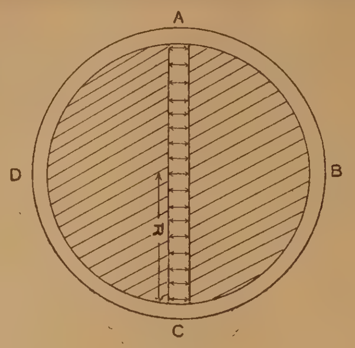


FIG. 22

25. I have intentionally separated my remarks in consideration of forces applied to a rigid body from the consideration of more than three forces applied to a point. I desire to impress the distinction upon the minds of students. The forces applied to a rigid body may be represented by the sides of a closed polygon taken in order, and yet they may not be in equilibrium; the rigid body is subjected to a couple, as a rule, in such a case. I have shown (paragraph 15) how to find the line of action of the balancing force when its amount has been found by means of a polygon. It is very desirable to have this operation impressed upon our minds as a distinct idea separate from the idea of forces balancing about a point. If a rigid body is fixed under a system of forces—forces equal and parallel to these forces will balance about a point; and, therefore, a system of forces equal and parallel, but of opposite courses, will balance about a point. I make use of this in paragraph 13 to explain "taking moments." Paragraph 8, Fig. 3, shows how to prove the triangle of forces experimentally; the polygon of forces follows from the triangle of forces. Suppose the forces (Fig. 23) a, b, c, d, e as balancing about O: by the triangle of forces *a* and *b* may be replaced by *f* and *d* and *e* by *g*, and the triangle *f g c* represents balancing forces.

If we know the directions of three forces which balance about a point, we know the angles (the species) of the triangle; and if we know the amount of one force, we know one side of the triangle, and we can therefore find the other two sides.

The principle of the polygon and triangle of forces enables us, by the solution of triangles, to determine forces or their directions from sufficient data. If we have given all the angles of any polygon and all its sides but two, we can determine those two sides. This is the most usual case we have to deal with. If we have given all the sides and all the angles but two, we can determine those two angles. It is well to remember these limitations.

It is my desire, whenever it is practicable, to use building illustrations. It may, however, be useful to consider the stress diagram of a wheel with spokes which can only bear tensile stress (Fig. 24). The wheel rests on the ground at A, and it has the spoke A O vertical. The rim is taken as being jointed at the ends of the spokes; for simplicity the weight of the wheel is neglected: the load equal to *a* is applied a to. Commencing with the triangle *a* 16 1, we get the forces at A, the spoke here offering no resistance to the force *a*: these forces at A are all thrusts or compressions. The triangle 1 *b* 2 is next drawn. Keeping the point B in sight, and taking the forces in the direction of the hands of a watch, and keeping also in view the lines on the diagram—bearing in mind that the lines of the diagram which have their courses towards the joint show compressions, while those from the joint show tensions—we find that 1 is a compression, *b* is a tension, and 2 is a compression. There is some little difficulty with beginners in getting into the habit of going round the joint in this way and settling the nature of the stresses: the line 1 is marked with two arrow-heads, because we take it in one triangle in one direction and in the other

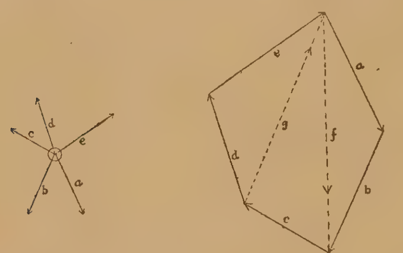

FIG. 23

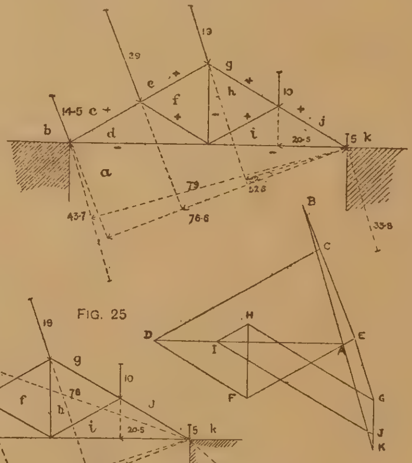

FIG. 25

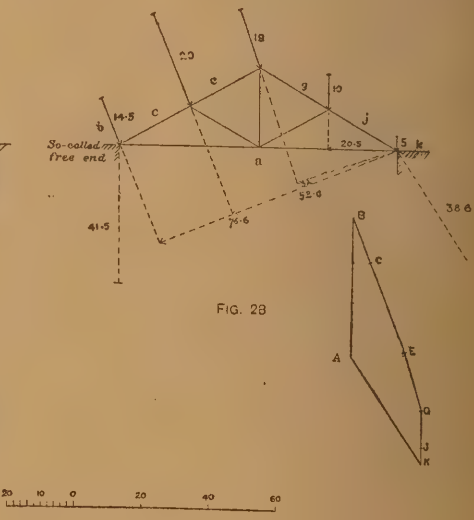

FIG. 28

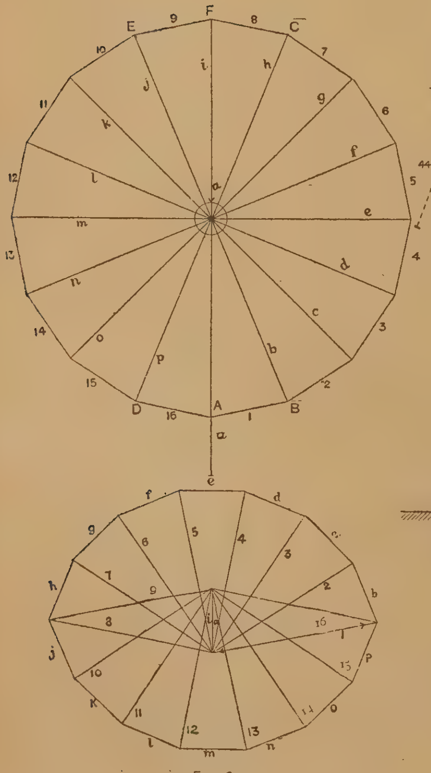

FIG 24

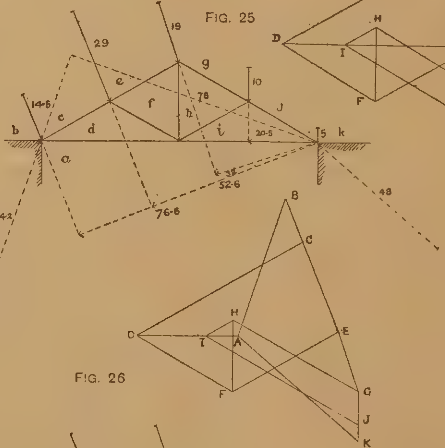

FIG. 26

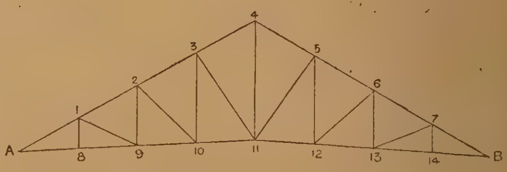

FIG. 29

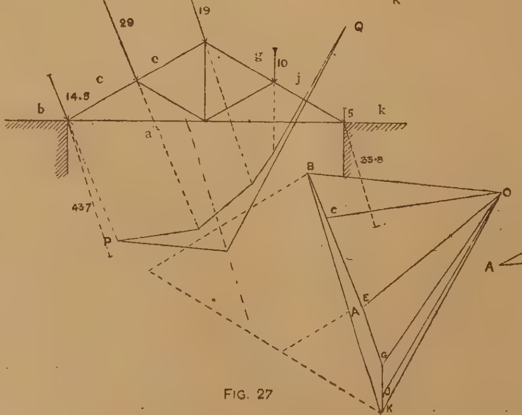

FIG. 27

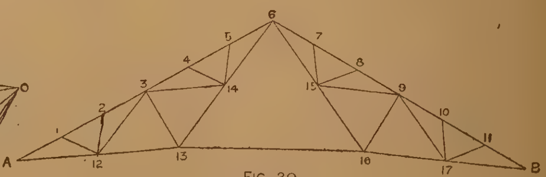

FIG. 30

triangle in the opposite direction. We proceed with the various joints in this way till we reach C. We have here to consider the load *a* applied in the direction *i* at O. Before dealing with this, we had better return to the joint D, and come round the other way till we reach E; and now we find that we have a closed polygon for the forces (all pulls) acting upon O. But we have supposed an external vertical force equal to *a* to act at O—where does this force appear on the diagram? Let us consider the joint F.

We have the stresses 8 and 9, and it is necessary to have a force equal to *a* applied at F to complete the triangle. This force is supplied by a tension in *i* equal to *a*, and this is exactly supplied by the applied force at O.

An inspection of the diagram will show that the stresses in the spokes are all equal, and they are each equal to *a*. It will also be seen that increasing the number of spokes and at the same time increasing the number of joints weakens the wheel by increasing the stress upon each element of the rim.

If we take (as in the case of the hind wheel of a bicycle) the load *a* to be $\frac{1}{10}$ ton, allowing a sufficient factor of safety for a structure of this kind, the spokes would need to be $\frac{1}{4}$in. in diameter, and this is much greater than we have them in common bicycles; but in common bicycles the rim is not jointed and this makes all the difference. In working stress diagrams we frequently deal with parts which are not joints as if they were joints. Again, in most cases we deal with our loads as if they were a series of weights without mutual reactions and as having no self-supporting value; but, as a rule, structural loads have self-supporting value or may be arranged to have it, and this should be properly taken account of in the design.

Let it be repeated, the student will get very little good by copying diagrams from books of them or from cards specially prepared as lessons. It may be useful to a draughtsman, whose every-day business it is to draw stress diagrams, to see how similar forms have been treated by other men, and he may have examples to consult; but the most useful course for the student is to keep to one or more simple forms and master the habit of drawing diagrams for these. If the student can draw the diagram asked for in question 45, South Kensington Subject III. papers, this year, he should be able to draw any other diagram of a roof truss that may be required. It should be the business of the student to economise his memory; many a good brain is injured by being filled up with a disorderly lumber of formulæ and diagrams. Let students who think they have "bad memories" take heart; the mental exercise occasioned to some men by their want of easy memory is the very best thing they could be busy about.

26. Fig. 25 shows the method of taking moments about the right-hand point of support. We find the lengths of the perpendiculars upon the forces to be as marked: we draw the polygon B, C, E, G, J, K as if the forces surrounded a point, and we find the balancing force as B K, giving its amount and direction.

We now settle that we shall decompose this balancing force as two parallel forces whose points of application to the rigid body shall be at the points of support. We draw the dotted line at the left point of support parallel to B K.

$$\begin{array}{llcr} 10 & \times\ 20{\cdot}5 & = & 205 \\ 19 & \times\ 32 & = & 608 \\ 29 & \times\ 52{\cdot}6 & = & 1525{\cdot}4 \\ 14{\cdot}5 & \times\ 76{\cdot}6 & = & 1110\ 7 \\ \hline & & & 3449{\cdot}1 \end{array}$$

Divide this sum of moments by 79, and the quotient is 43·7, which amount is represented by the line B A, and it is the reaction of the left-hand wall; the remainder, A K, is the reaction of the right-hand wall.

Let us now, once for all, go round the joints of this truss to find the stresses. Commencing at the left-hand point of support, we mark the spaces between the lines of action of the forces by letters *a*, *b*, *c*, *d*; we go round the joint in the direction of the hand of a watch, keeping our eyes on the truss and the stress diagram at the same time; we proceed from A to B, and we begin with the known force A B, which is already drawn; and now we draw B C, also already drawn; and now we draw C D parallel to the rafter of the truss; we know the polygon must close with D A, and consequently this line parallel to the tie of the truss finds for us the point D. We have now to determine whether these stresses are compressions or tensions; A B is a thrust *against* the joint, a compression; B C is also *towards* the joint, a compression; C D is again *towards* the joint, a compression; but D A is *from* the joint, and it is, therefore, a tension. Beginners have difficulty in seeing these "*from* the joint" and "*to* the joint" stresses, but the work is worth a small exercise of patience. I have no difficulty whatever, looking at the two figures—the diagram and the truss—in feeling that when I name the letters D A on the diagram that I am moving in a sense "from the joint" on the truss. Next take the joint *d*, *c*, *e*, *f*. We already have D C; C E is 29. From E we draw E F parallel to the rafter, and we find the point F by drawing D F parallel to the strut. Now, if we attempted to draw the polygon for the joint at the bottom of the king rod we should find that we had not sufficient data. We know A D, and we know D F, and we have the directions of the other forces. But there are *three* forces to be determined, and we can only determine *two*; we must therefore take the joint at the open first, so we begin with F E, next E G. We then draw G H parallel to the rafter, and a vertical line from F finds us the point H; knowing F H, we can now draw the polygon for the bottom of the king rod: A D tension, D F compression, F H tension, H I compression and I A tension. The polygon for the next joint *i*, *h*, *g*, *j*, tests the accuracy of our work; because the side J I of the polygon, being the only one to be determined in amount, must satisfy double conditions; that is, its amount must equal the distance I J, and besides, the line I J must be parallel to the rafter of the truss—this we find to be quite so. Finally the polygon A I, I J, J K, K A represents the forces about the right-hand point of support.

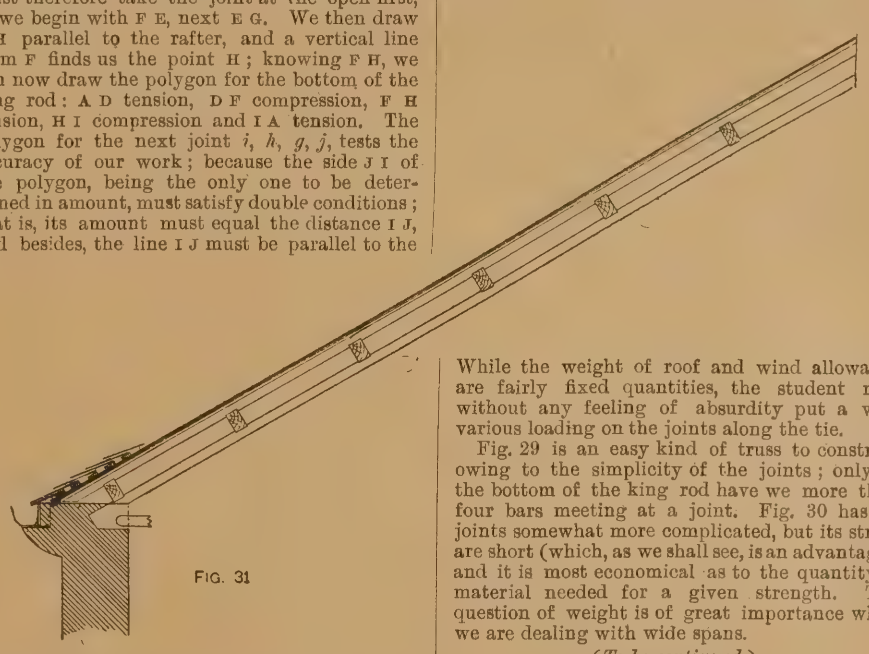

FIG. 31

Referring to Fig. 26, it is frequently assumed that the truss may be fixed at one end, and that in such a case the reaction at the other end will be vertical. I see no particular advantage in this way of treating the question. The behaviour of large trusses resting on stirrups or roller bearings, to provide for expansion by increase of temperature, is a subject to be taken account of; if the truss is fixed at one end, and on roller bearings at the other, the rollers would require to be frictionless to give an absolutely vertical pressure on the wall. This subject may be reverted to again; but if this question of variable reaction is to be dealt with, it is better to take the general case. The truss may be maintained in equilibrium in infinite ways by reactions at its ends; if we assume any particular direction at one end we shall have a consequent direction at the other end; in Fig. 26 the direction at the left-hand end is assumed as shown, the sum of the moments of the applied forces is divided by the length of the perpendicular from the right-hand end, and the quotient is the value of this left-hand reaction; it is A B; the stress diagram is drawn as shown in the figure, and we get A K as the direction and value of the right-hand reaction.

Fig. 27 shows the usual way of getting the balancing force on the truss, considered as a rigid body. The point O has been chosen in such a position as to show in a marked manner that the point A cannot be found by drawing a line through O parallel to a line joining P and Q. This is a very common mistake which students make. In the case of where the loads on the truss are all vertical, the point is found by drawing a line from O parallel to P Q. I leave it to students to discover for themselves why it is not so in the general case. In the figure A is found by dividing B K, so that the parts are proportional to the parts into which the direction of the balancing force divided the tie of the truss.

Fig. 28 shows the truss with the reaction at the left hand end vertical.

Figs. 29 and 30 show usual forms of truss for wide spans; and Fig. 31 is to show how the weight of the roof comes upon the truss. The student is advised to draw stress diagrams of these trusses with various loads, not fantastic loads. Besides the weight of the roof, trusses will have to carry the weights of ceilings; and in some cases very considerable weights may be conveniently suspended from trusses so as to free the ground floor from pillars in inconvenient places, &c. Much more of this kind of construction might be carried out than is done, particularly in connection with shops, where wide free windows and spaces are desirable. While the weight of roof and wind allowance are fairly fixed quantities, the student may without any feeling of absurdity put a very various loading on the joints along the tie.

Fig. 29 is an easy kind of truss to construct owing to the simplicity of the joints; only at the bottom of the king rod have we more than four bars meeting at a joint. Fig. 30 has its joints somewhat more complicated, but its struts are short (which, as we shall see, is an advantage), and it is most economical as to the quantity of material needed for a given strength. The question of weight is of great importance when we are dealing with wide spans.

(*To be continued.*)

ASSOCIATION OF MUNICIPAL CORPORATIONS.

THE autumn meeting of this Association was held last week at the Westminster Palace Hotel, Sir A. K. Rollitt, M.P., the president, in the chair. The town clerk of Wolverhampton moved a resolution asking the president of the Local Government Board to receive a deputation from the Association on the subject of lessening the cost and inconvenience incurred in the promotion of private Bills, and the consolidation and amendment of the laws relating to public health. A certain Dublin Bill cost £40,000 to carry through Parliament, a district with a ratable value of £40,000 had to spend £10,000 on a drainage Bill, while on another occasion £60,000 was spent to promote a water Bill. At the close of a long discussion it was left to the Association to devise the best course to be pursued. The Mayor of Plymouth moved a resolution urging the Local Government Board to bring its practice into harmony with that of the Home Office by granting the full term of sixty years for the repayment of loans for workmen's dwellings. In Plymouth they spent £83,000 in clearing sites and putting up buildings, but owing to the restrictions of the Local Government Board they had rather intensified the evil they meant to deal with. They wanted to provide for labourers earning from 15s. to 18s. a week, and their families. They had to acquire a number of overcrowded areas, and then the buildings they were able to put up provided for such people a suit of rooms for which they would have to pay 4s. 6d. a week, which was utterly beyond their means. The resolution was unanimously passed.

PROFESSOR BLYTH ON VENTILATION.

THE annual general meeting of the council and members of the Incorporated Society of Medical Officers of Health was held on Friday last in the Richelieu Salon of the Hotel Cecil.

Professor A. Wynter Blyth (who is the medical officer of health for Marylebone) in his presidential address dealt with the subject of "Ventilation." In these days it had come, he said, as a revelation and surprise to many that not a drug in the Pharmacopœia, not an animal extract, not one physical appliance with which science had enriched the remedial art, neither singly nor collectively, was equalled in the treatment of tubercle to bathing the lungs and skin in the fresh air of heaven. There were two distinct advances in the theory and practice of ventilation which had been recently made; the one was the publication by the Sanitary Institute of the Report by the Cowl Committee; the other the wide distribution of electric energy, permitting such mechanical appliances as rotating fans to be utilised by ordinary householders. Wherever there was an electric supply, mechanical ventilation was cheap and practicable. Speaking of the ventilation on the Central London Railway, and of certain experiments that had been made, the president said that, taking the whole results, they showed that, so far as respiratory impurity went, the Tube Railway gave better results than the Underground Railway, and better results than in ordinary places of assembly. Even in a crowded lift the sojourn was too short to seriously contaminate the air, and since each lift when it ascended to the level of the street had the advantage of thorough ventilation, the transient contamination of air during the sojourn was swept away. As to the ventilation of sewers, he had the utmost confidence that the problem was capable of solution by a suitable arrangement of fans driven by electric or other power. The best method of ventilating an ordinary room was a good warm air-grate, with an electric fan, which could be arranged so as to draw the air more rapidly from the back of the grate. With regard to the ordinary tenement house, it was hopeless to suggest any mechanical appliance. The essential thing was to see that the passages and staircases were well ventilated. It was when the house was shut up at night that the great harm from bad air was caused. It was erroneous, on the other hand, to condemn a place as unfit for work or habitation because it was underground, inasmuch as it was within the possibilities of modern science to make the deepest mine not only habitable, but agreeable and healthy. Not a single artisan's dwelling was ventilated by mechanical means. It might be hereafter a contribution to the solution of the housing question to build downwards in the depths, instead of upwards on the mountain. It was far better to work in a room with the window wide open than to have a ventilator. With the growing price of land in our cities, the increasing cost of building materials, and the increasing severity of building by-laws, there did not seem the smallest possibility that the cubic space per head would be increased; consequently, they were bound to consider seriously the question of mechanical ventilation, and to welcome every step which cheapened the delivery of pure air by the aid of motive power. If only there was a large demand by the public for mechanical ventilating appliances, the market would be flooded with such appliances, which could be obtained and maintained at a cheap cost.

In a discussion which followed, Dr. Gwynne (the late medical officer of health for Hampstead) declared that a fortune awaited the discoverer of some automatic means of ventilation. Subsequently the members dined together in the same building under the presidency of Professor Blyth.

Law Cases.

Dangerous Acids in Sewers.—Messrs. Cresswell Brothers & Schmitz, of Red Lion Square, appeared last week before Mr. Marsham at Bow Street to three summonses charging them with allowing chemicals or manufacturing refuse to flow into a public sewer. Mr. Dumas stated that the proceedings were taken under the London County Council (General Powers) Act of 1894, the object of which was to prevent the discharge of offensive or injurious matter into sewers, the penalty being £20 for the first offence and £5 for each day on which it was repeated after conviction. The defendants were sponge bleachers in Red Lion Square. For a long time past strong sulphuric fumes had been noticed in the main sewer in that neighbourhood. Indeed, they had been noticed half a mile away. Some of the men employed in the sewers were quite overcome by the fumes. At last, after a great deal of trouble, the nuisance was traced to the defendants' premises. Samples were taken. One contained 201 grains per gallon of sulphurous acid. Other samples contained 318 and 295 grains of sulphurous acid per gallon, and these, of course, were dangerous quantities. Some of the bricks in the sewer in the neighbourhood of the defendants' premises were eaten away by the acid. If the defendants had treated the chemicals with lime or soda, they would have been rendered perfectly harmless. Mr. Hale, for the defence, said that the defendants had been engaged in business for thirty years, and they felt that they ought to have received some warning before these summonses were issued. Mr. Marsham said the local authority was not bound to provide sewers for carrying away dangerous acids. The action of the defendants might have caused great suffering to the men who had to work in the sewers, and they would be fined £5 on each summons and £10 10s. costs, £25 10s. in all.

Bricklaying as an Excitant.—A merry-looking old Irishman named Murphy appeared before Mr. Plowden at the Marylebone Police Court last week, and in reply to a charge of being drunk and disorderly said the only excuse he could offer was that he got the chance of getting some work the previous day, and that made him excited. Mr. Plowden: "I am curious to know what that work is." Prisoner: "Brickwork, your lordship. From my childhood I have laid bricks." "And you are so fond of it that the mere thought of it makes you get drunk! Have you got a job?" "I have the prospects of one." "That looks as if you are going to get drunk again." "Oh no, I'll watch it, your lordship." "Well, I won't stand between you and the fruition of your dearest hopes. Go and lay bricks as fast as you can."

CASKET IN IVORY, EBONY AND PEARL, BY J. PAUL COOPER, ARCHITECT.

A Bristol Arbitration Case.—Mr. H. R. Withycombe, the arbitrator in the dispute between Messrs. A. Krauss & Son, contractors, and the Corporation of Bristol with reference to the contract for enlarging the City Lunatic Asylum, has made his award. The evidence was taken about two months ago. Messrs. Krauss & Son claimed a sum of £4,737 on the ground that the Corporation had, as they alleged, delayed the execution of their contract by the non-delivery of goods which they undertook to supply themselves. The date of the contract was October, 1897, and the total amount was £36,927. The claim was made up as follows: Increased cost of labour £822, increased cost of supervision £569, increased establishment charges £502, increased use and depreciation of plant £336, loss of interest on capital locked up in the undertaking £395, and loss of profit on work which might have been done elsewhere if Messrs. Krauss & Son had not been detained on this particular work. We understand that the arbitrator has ordered the Corporation to pay Messrs. Krauss £120 in respect of their claim; and as the amount awarded is less than the formal offer made by the Corporation before the arbitration, Mr. Withycombe has directed that the costs of the arbitration and reference shall be paid by the claimants.

New Companies.

Cookstown Lime Co., Ltd.

Registered for the purpose of acquiring from the Cookstown Gas and Light Company certain plots of land, quarry limekilns, buildings and premises, and to carry on the business of lime-burners and manufacturers. Capital £1,200, divided into £1 shares. The first directors are the Rev. Hamilton Brown Wilson, James Dickson Anderson, John Thompson and Thomas Wallis, all of Cookstown. Registered office: Molesworth Street, Cookstown, co. Tyrone.

High Field Estate Co., Ltd.

Registered to acquire any lands, buildings or other hereditaments in the counties of Durham or Northumberland, or elsewhere, or any interest therein; to purchase a plot of land near Felling, in the county of Durham; and to carry on the business of estate owners and managers, quarry owners, builders, contractors, decorators, carpenters, joiners, cabinet makers, plumbers, engineers, brick, tile, pipe, stone, sand, cement, lime, hardware and timber merchants, &c. Capital £16,000 in £1 shares. Registered office: 60, King Street, South Shields, Durham.

East Barry Land Syndicate, Ltd.

Registered to erect dwelling-houses, villa residences, cottage-dwellings, shops, warehouses and other buildings in the counties of Glamorgan and Monmouth or elsewhere; as builders and contractors; to deal in and with any freehold and leasehold ground rents. Capital £5,000 in £5 shares. The first directors are A. Richards, A. Jackson and J. Roberts. Registered office: Metropolitan Bank Buildings, Barry, Glamorganshire.

F. J. Martin & Worthington, Ltd.

Registered to acquire the business carried on by G. A. Worthington at St. James' Road and Albert Road, Southsea, Hampshire, and to carry on the business of oil and colour merchants, manufacturers and factors of and dealers in varnish, japan, paints, oils, colour, turpentine, lead glass, plumbing goods, wallpapers and brushes, &c. Capital £7,500 in £1 shares. The first directors are G. A. Worthington (chairman) and Mrs. A. M. Worthington. Registered office: 51 and 53, St. James' Road, Southsea.

The Casket in ivory, ebony and pearl illustrated on the previous page was made by Mr. J. Paul Cooper, the eminent architect, of Aubrey Walk, Camden Hill, Kensington, W., whose craftwork is well-known at the Royal Academy and the Arts and Crafts Exhibitions. Many of our younger architects are now able craftsmen, and they undoubtedly derive much good from this study in branches of constructive design.

New Patents.

These patents are open to opposition until December 2nd.

1900.—Water-Closets.—16,896. J. G. Davidson, East Church Manse, and J. Don, 53, King Street; both of Peterhead, N.B. Instead of pulling a cord, the cistern is discharged by pressing an electric button. This causes an electro-magnet to release a tipper, or, in another type, lifts the cap of the syphon and so effects the discharge. In both cases the parts automatically readjust themselves after the flush has taken place.

Tile Presses.—17,132. R. Stanley, Manor Court, Nuneaton. This invention relates to a press having a number of small plungers fitted to one head, in combination with a corresponding series of die-boxes. The tiles are pressed endways, which enables sharper and harder arrises to be obtained; moreover, the tiles are given a perfectly smooth face. Little or no more power is required than for pressing a single tile.

Goods Conveyors.—20,290. W. H. Aston, 46, Eagle Wharf Road, London, N. A spiral framework is arranged between the floors, and is fitted with a moving track, consisting of a number of treads attached to an endless chain. On this track the goods are placed, there being also a spiral for bringing them down from the upper floors to the lower ones.

Road Scarifiers.—20,291. T. Musto and G. Musto, East London Iron Works, Bancroft Road; and J. Jones, Bruton Works, Bruton Place, Commercial Road, London, E. On a suitable carriage are mounted a steam or gas engine and a frame carrying a number of pointed steel bars. After these bars have been driven into the ground by a monkey, the machine is made to travel forwards so as to break up the ground. The invention is chiefly intended for use in connection with wood-paving.

Public Washhouses.—20,674. D. K. Tullis, Kilbowie, Dumbarton. The object of this invention is to remove the steam and vapour so common to public washhouses. The steam in the coppers is taken off by an overhead pipe running from one end of the building to the other, communicating with an induction pipe which conveys sufficient hot air to rapidly condense the steam so that it can be suitably discharged. Hot air is also employed for drying the clothes on the horses.

Refractory Materials.—21,496. R. J. Friswell and The British Uralite Co., Ltd.; both of 37, Lombard Street, London, E.C. Articles saturated with silicate of soda are exposed to the action of carbonic acid gas in a closed chamber, the sodium carbonate and bicarbonate so produced being subsequently removed by washing.

1901.—Square for Determining Slopes and Batters.—937. M. S. Excell, 1, Honiton Road, Kilburn, London, N.W. This invention is intended to facilitate the drawing of slopes or batters such as are needed in sea walls, roofs, embankments, &c. It consists of a piece of celluloid, brass, pearwood or other suitable material about 12in. square and $\frac{1}{16}$in. thick. A number of slits are formed in it corresponding to certain batters, through which slits a pencil point is passed for the line to be drawn.

Doors.—5,370. E. J. Goodwin, 4, Beacon-close Terrace, New Brompton, Kent. A small metal roller resting on a plate is let into the lower corner of the door in order to prevent "hanging."

Foundations in Water-Logged Ground.—16,721. N. Schietkiewicz, St. Petersburg. The water is withdrawn by pressure pipes, and liquid cement is then forced in to form a solid foundation.

The following specifications were published on Saturday last, and are open to opposition until December 9th. The names in italics are those of communicators of inventions. A summary of the more important of them will be given next week.

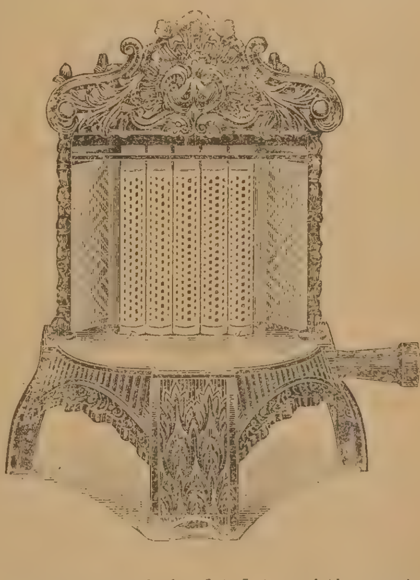
1900.—16,787, Young, locks. 17,685, Gaines, apparatus for printing upon tiles, glass, &c. 17,734, Crossley & Atkinson, purifying gas and heating and moistening air. 17,762, Lane, manufacture of gas. 19 264 Cameron, Commin & Martin, sewage works. 20,073, Smith, purifying acetylene and other gases. 21,047, Young, lock staples and locks. 21,243, Rössler, dust-destroying apparatus. 21,692, J. Duckett & Son, Ltd., & Bullock, urinals. 21,765, Beards, locks and latches. 22,105, Hobman, street-paving.

1901.—2,766, Gossweiler, acetylene generators. 3,629, Farnsworth, jacks for lifting purposes. 9,262, Hansel, machine for making dovetails. 9,481, Murphy, pressure tanks. 10,437, Eguia & Bourrelly, gas burners. 11,747, Gulland, stand pipes. 12,074, Goether & Wetzel, street sand bins. 12,900, Diehl, dampers for stove pipes, &c. 12,956, Trocquenet, incandescent gas burners. 15,214, Kreft, digesters for the manufacture of artificial stone. 15,584, Frank, valves and cocks. 16,099, Boult (*Granjon & Isnard*), gas burners. 16,184, Crombie, pipe couplings. 16,614, McIsaac, rollers for window blinds. 16,698, Brion, pulleys. 16,755, Harling, locks and fastenings. 17,035, Hoskings, handles for files, chisels, &c. 17,148, Crich, cupboard fasteners, &c. 17,440, Cooley & Honstain, fireproof granary. 17,498, Howorth (*Persehke*), water-closets. 17,646, Haddan (*Harris & Smart*), gas burners. 17,649, Sorge, water-purifying apparatus. 17,760, Mason & Musgrave, water-closets.

Trade and Craft.

A New Radiator.

The new "Clamond" gas radiator is worthy of the closest inspection, as it is neat in appearance, effective, and economical in working. It is the application of the well-known Kern incandescent gas-light burner system to gas fires, in which the proportions of air and gas have been carefully determined so as to secure almost perfect combustion, while giving at the same time a powerful radiant heat. One of these radiators, consuming 10 cub. ft. of gas per hour, will sufficiently warm a medium-sized room at a cost of 1d. for three hours (taking gas at 2s. 6d. per 1,000 cub. ft.). The smaller and simpler patterns can easily be fitted to existing grates, but as a certain amount of their heat passes into the flue they are not of such high efficiency as those in which the cast-iron casing is heated by the escaping gases, thus producing a combination of radiated and convected heat. The "Clamond" gas radiators are constructed to burn 10, 20 or 40 cub. ft. per hour. Those burning 20 or 40 cub. ft. have ten perforated clay tubes fed from both sides of the stove, so that one half may be extinguished when the room is sufficiently warm; special attention is called to this arrangement because it is a well-known fact that with gas stoves the best results are obtained by perfect combustion, which is not secured when the taps are checked. Further particulars of these radiators can be obtained from the Kern Burner Co., Ltd., of Kern Buildings, Gravel Lane, Southwark Street, S.E.



COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
	BUILDING:		
Oct. 31	Brockley, S.E.—Sorting Office	Commissioners of H.M. Works	J. Wager, H.M. Office of Works, Storey's Gate, S.W.
„ 31	Wandsworth, S.W.—Intermediate School	Guardians	Lansdell & Harrison, 65 & 66 Basinghall Street, E.C.
„ 31	Low Bridge, near Kilfinane—Creamery	Co-operative Dairy Society, Ltd.	J. C. Bennett, Hon. Sec., Kilfinane, co. Limerick.
„ 31	Keighley—Public Free Library	Corporation	A. MacKewan and J. A. Swan, Newhall Street, Birmingham.
„ 31	Bootle, Lancs—Enlargement of School	School Board	J. Cox, 11 Dale Street, Liverpool.
„ 31	Cork—Concert Hall at International Exhibition, 1902	Exhibition Company	H. A. Cutler, Cork City Engineer, Municipal Buildings, Cork.

„	Stockport—Municipal Buildings (send in names by Nov. 4).	——	R. Hyde, Town Clerk's Office, Stockport.

Masters and Men.

Barrow Joiners' Dispute.—There is every probability that the dispute between Messrs. Gradwell and their joiners, at Barrow, will be amicably settled. The men objected to shipwrights rebuilding a new pier, and in consequence all Gradwell's men were called out. A deputation of the men met the Masters' Association last week, and after a prolonged discussion it was decided to refer the matter to arbitration of two men from each side, along with an umpire.

The Blackpool Joiners' Strike.—The master-builders of Blackpool have made another attempt to come to terms in respect of the joiners' strike. The masters were asked to consider a proposal from the men to allow them to go in at 8¾d. per hour. The masters have referred the men to a previous letter written to them on this point, in which they state that the men can return at 8½d. per hour. They definitely refuse, however, to make any further concessions.

The Aberdeen Building Branch of the United Operative Masons and Stonecutters' Union.—At a recent meeting (Mr. George Ogg, president of the local branch, in the chair) it was decided to have the union represented at the next Trades Union Congress, which is to be held in Falkirk in April, 1902. It was also resolved to have a series of lectures on architecture, geology and kindred subjects delivered during the winter months. The union agreed to pay six members £25 each for the loss of sight of an eye, under the accident benefit rules which have just come into operation; also to pay the maximum accident benefit of £50 to another workman for the loss of an arm.

TENDERS.

Information from accredited sources should be sent to "The Editor." Results of tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

BARKING (ESSEX).—For making-up, &c, Longbride Road for the Barking Urban District Council. Mr. C. F. Dawson, surveyor:—

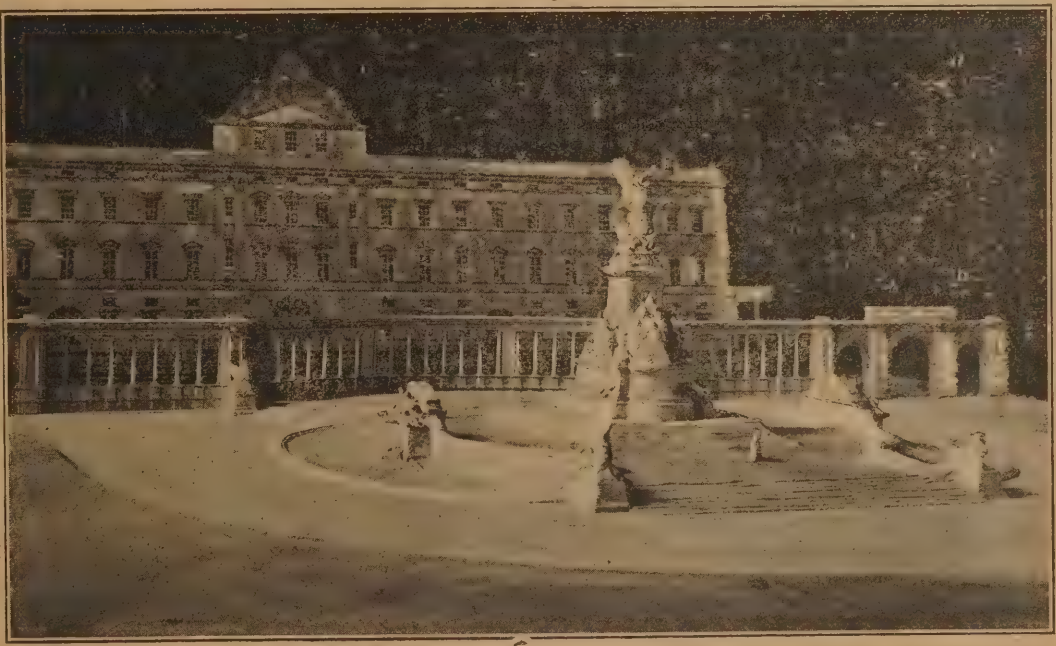
An Architectural Causerie.

The Victoria Memorial Designs.

OF the five sets of designs for the National Memorial to Queen Victoria now exhibited in the banqueting-room at St. James's Palace, Mr. Aston Webb's is by far the most satisfactory. It is more monumental than the others, and its planning is clearer and more direct. As we publish illustrations of the scheme this week, it will serve no purpose to describe it at any length. Suffice it to say that the existing railings in front of Buckingham Palace are replaced by a stone or marble screen which forms the chord, so to speak, of a semicircular double colonnade of Ionic columns, the space thus enclosed measuring 800ft. by 450ft. and being called "The Queen's Garden." Mr. Brock's memorial occupies a central position in front of the screen, while a fountain is arranged at each side against the colonnade, the whole being made bright with beds of grass and flowers. Leading straight from this "garden" eastwards to Spring Gardens are a central processional drive and two carriage roads, the latter communicating respectively with the altered routes from Constitution Hill and Buckingham Palace Road. The Mall is thus entirely remodelled, and the processional drive made axially in line with the centre of the Palace. At each side of this roadway are plots of grass planted with trees and having sculptural arches set crosswise so that they may be seen to more advantage, while at the eastern end is a circus enclosing a central memorial of Queen Victoria as she was in 1837. From this circus a new road is formed axially in line with the West Strand, a most admirable arrangement. There is thus a monumental avenue leading from the Palace practically into Trafalgar Square. The Palace, moreover, is made more satisfactory by the addition of a central domed Mansard roof, and lower additions of the same kind at each end. Other details can be seen by examining the perspectives.



PLASTER MODEL OF THE NATIONAL MEMORIAL TO QUEEN VICTORIA. T. BROCK, R.A., SCULPTOR.

We may next refer to the remaining four designs. All provide for the remodelling of the Mall in much the same manner as Mr. Aston Webb, but only one of them (Sir Thomas Drew's) includes any alteration to the Palace front, which is a most imperative matter. According to this design, a pavilion block would be raised at each end, advanced from the building in order to cast shadows which would break the monotony of the elevation; and a Corinthian order would be applied, elevated on a rusticated or coursed basement, as an improvent on the present lowest storey. Sir Thomas Drew encloses a space in front of the Palace with the memorial in the centre, but his treatment is somewhat incoherent and the irregular arrangement of the roads from Constitutional Hill and Buckingham Palace Road is not pleasing; the best portion of this design is the treatment of the eastern end of the main avenues. Here are provided new offices for the County Council, which form a space 110ft. across called "Spring Gardens Court," closed at one end by a triple archway surmounted by a group of sculpture. The provision of semicircular places at the entrances of Marlborough and Clarence Gates hardly seems necessary. Mr. T. G. Jackson shows a squarely-treated colonnade in front of the Palace, closed by a line of State and royal gates. The colonnade has end and angle pavilions; but while the general treatment of these is very academic, the detail is not so good as it might be. Garden beds are arranged inside the colonnade, and groups of statuary emblematic of the Colonies are introduced. Mr. Jackson also has a series of statues on each side of the roadway leading to Trafalgar Square, and his archway at the eastern end is very pleasing. Mr. Ernest George puts the existing railways square with the Palace facade, but does not alter the roads from Constitution Hill and Buckingham Palace Road, which is a distinct fault in the design. The memorial he sets on an oblong platform approached by a flight of seven steps, with a fountain at each end having a large circular basin. This does not satisfy the eye, however, and the effect is not enhanced by the introduction of four electric standards. The central roadway in the Mall is made 120ft. wide, with an 80ft. carriage-way at each side. The royal entrance at Spring Gardens has three arches, the central one closed by gates and the other two left open. Opposite Marlborough Gate a possible future road is shown, with a bridge over the lake. Dr. Rowand Anderson's design is the most disappointing of the whole set. He puts a screen in front of the Palace, with the memorial at a distance of about 200ft. from it, enclosing a space like the rest, but instead of employing a colonnade he shows a low balustraded wall, which makes the whole scheme look cold and meagre. The main avenue is made 90ft. wide. Opposite Marlborough Gate is a recess containing a statue of Queen Elizabeth, and at Clarence Gate are statues of King Alfred and William the Conqueror, while a new roadway is shown opposite the Duke of York's column. These then are the designs, the general appearance of which can be gathered from the illustrations which we are able to publish this week. Of Mr. Brock's memorial itself one can say little more than what was said a short time ago when the small sketch model was exhibited at the Foreign Office—that it is likely to be very satisfactory when erected. The least pleasing portion of it is the figure of the late Queen herself, but the difficulty—almost insuperable—of successfully accomplishing such a task will be at once apparent. The memorial as a whole masses well, and its surroundings are excellently contrived. But it should not be forgotten that both the architect's and the sculptor's designs are far from complete and have already been altered considerably. This is evident, for example, in the two treatments of the main entrance to "The Queen's Garden," the perspective looking *towards* the Palace being the more recent of the two. Other alterations are also contemplated, such as the rearrangement of the walling next the lake. There is one question which at once suggests itself when inspecting the designs, or more especially Mr. Aston Webb's—where is the necessary money coming from? It seems to us that the major part of this memorial scheme needs to be completed by the present generation and not left to our successors who are not so closely connected with it, yet at the present moment the total sum of money contributed towards the cost does not amount to much more than £170,000; and when it is recollected that the Albert Memorial even—a disconnected single erection—cost £120,000, one wonders how the present scheme is to be carried out. Mr. Brock's memorial itself will eat up the bulk of the funds in hand at present, but the architectural scheme will cost a much greater sum. Consider the cost of remodelling the Mall and the Palace front alone, irrespective of a great colonnade and its appurtenances. One is of course familiar with the statement that it is not intended to complete the whole of the scheme at once, but if there is not sufficient money forthcoming to do more than a portion—even the memorial and the surrounding colonnade—it will be better to leave the scheme alone and adopt a less monumental one which can be carried out thoroughly. Mr. Aston Webb's design is, as we have said, the best of the five submitted, but that does not say it is the best possible; rather we hold to our original opinion that, with such an opportunity as this memorial affords, it would have been better to have held an open competition. It would undoubtedly have drawn a host of inferior designs, but there might have been a few of superlative merit; and not one of the five designs submitted can warrant such a description.

THE LONDON COUNTY COUNCIL AND THEATRES.

DISCUSSION AT THE O.P. CLUB.

On Wednesday evening last at the Criterion Restaurant, Piccadilly, under the auspices of the O.P. Club, a discussion took place on the position of the London County Council in regard to the safety of the theatres under their control. The chair was taken by Mr. Carl Hentschel.

In opening the discussion Mr. Edwin O. Sachs, the well-known architect, said:—

Firstly, as to the general technical aspect of theatre-safety as we find it to day, please note that, as far as the primary essentials of such protection are concerned, the world's experts are by no means agreed.

Theatre Fires.

We all know how many serious theatre fires we have had, the loss of life and the lists of injured. We also know, though perhaps we scarcely realise the frequency, how often there are smaller fires at theatres of which the public and even the authorities hear little. I am not going into detail, but, just to mention a few figures, let me say that there have been no fewer than about 400 fires since 1881, resulting in the total destruction of theatre-buildings. These include the great catastrophies at Vienna, Nice, Exeter and Paris. The number of lives lost since 1881 to my knowledge has been over 1,000. These figures are from some statistics which I have been recently collecting and dealing with more than 1,200 cases of total destruction and the loss of almost 10,000 lives. As to the smaller fires, I will only note that during the year I served with the Berlin Royal Police Fire Brigade there were as many as forty-three fires in the Berlin theatres, and this city is well equipped with fire-watches during the hours of performance.

Now, theatre fires have been almost identical in every country as regards the outbreak, spread and result. The serious theatre fire as such is generally too much for the local fire-brigade, and if there is any extensive life-saving necessary the means at the disposal of the authorities are usually quite inadequate to deal with such emergencies. Everywhere the theatre fire has shown us that a combative or fire-brigade policy alone to meet a fire when it actually occurs is of no avail. The results everywhere called for

Energetic "Preventive" Measures.

Nearly every country has inaugurated a preventive policy. The countries of Europe and the western hemisphere have every kind of legislation conceivable for the protection of the public. There has been hysterical panic legislation, ponderously-conceived regulations in which every detail is defined by law, legislation which leaves practically everything to the discretion of an executive of experts, to the discretion of single officials, or, on the other hand, to the discretion of lay committees; and there have been regulations which are merely so in name and are a farce, because they cannot be enforced. There is no uniformity in legislation for theatre-safety—not even in its elementary principles. If we read the regulations of the different countries consecutively, with an idea of discovering what is really necessary, the result is most confusing. Now, I am not going into detail. I shall not quote paragraph clauses, &c., but I will say broadly that *some* countries seem to consider good construction the essence of safety, whilst clear planning, watching or inspection are forgotten. Other countries give all attention to endless regular inspection, and omit the watching; others, again, require inspection only; others perhaps, again, good planning, construction and ample inspection, but no watching at all.

What is Needed.

Well, it is really time for some representative body of experts, officials, managers and business men to decide, as based upon the experience of the great cities of the world generally, what is really essential, and then to see to what extent the world's wisdom can be applied to the best advantage to Great Britain and our Metropolis in particular.

To my mind clear planning in a theatre is of greater importance to the audience than clever fire-resisting construction, and to my mind the regular attendance of reliable fire-watches day and night, and especially during the performances, is more essential than any amount of surprise-inspection: but these are only personal views.

Personally, as a playgoer, I like to know distinctly that there is a straightforward simple route of exit, easily accessible from the seat I am sitting on, and I like to know that there are really well-trained efficient men permanently in the theatre on the look-out for danger and ready to cope with an emergency.

Personally, I consider the order of precedence for theatre-safety to be: (1) Straightforward planning; (2) regular watching; (3) skilled inspection; and (4) good construction.

Exits.

The protection of life by means of rapid exit should always have the first place. As we all know how easily panic occurs without any fire and how dangerous the rush of a frightened audience can be, the clear exit of ample dimensions with the simplest route will be the safest, and perfect symmetry of plan of most value for finding that exit. Panic is best guarded against by the constant presence of experienced and responsible firemen, who will, on the one side, see the possibility of danger and prevent it, and, on the other side, be able to act smartly in case of an outbreak and give the audience confidence. I do not wish to disparage good construction or regular and surprise inspections, but I consider many regulations as to construction and equipment materially discounted if the planning is not straightforward and a responsible fire-watch is not regularly on duty.

I have been over many theatres built, according to modern regulations, of the best fire-resisting materials, and yet have found them dangerous in the extreme, through bad arrangement of staircases and passages. I know many important cities which, though equipped with modern regulations for the erection and maintenance of theatres, have no powers to enforce the presence of an official fire-watch during the performances, or, for that matter, any fire-watch at all.

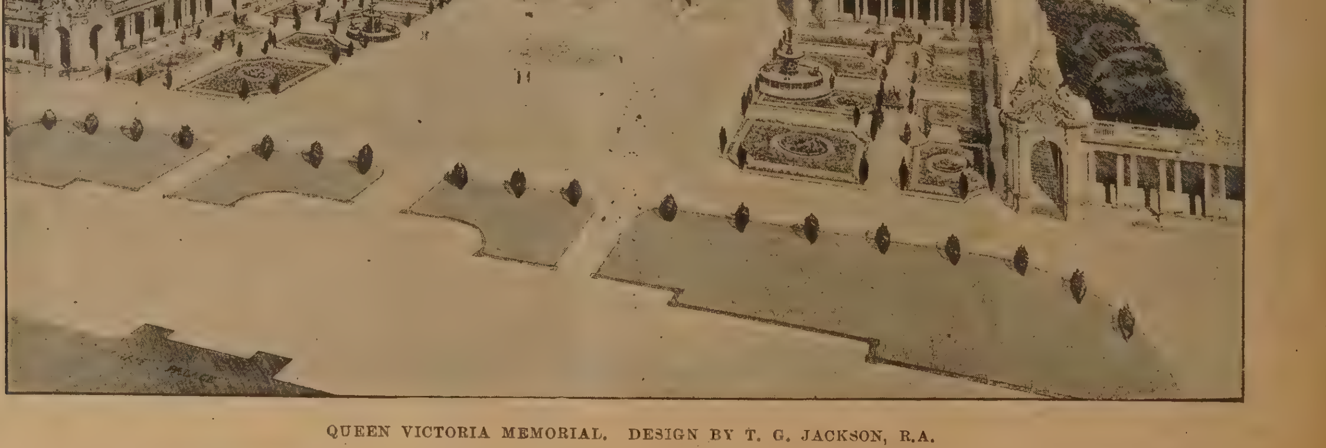
The New Regulations.

As to our latest London County Council theatre-regulations for new buildings, although they contain much that is extreme on the one hand, and neglect some points of vital importance on the other, they are in many respects model ones, and, speaking generally, both the playgoer and the aspiring theatre-builder can be well satisfied with them. They certainly somewhat fail the playgoer on the question of really straightforward planning, whilst the question of the fire-watch does not appear to be dealt with at all. But on the whole they will give us a better playhouse in the new century than we had in the old, without unduly taxing the theatre-owner of the future.

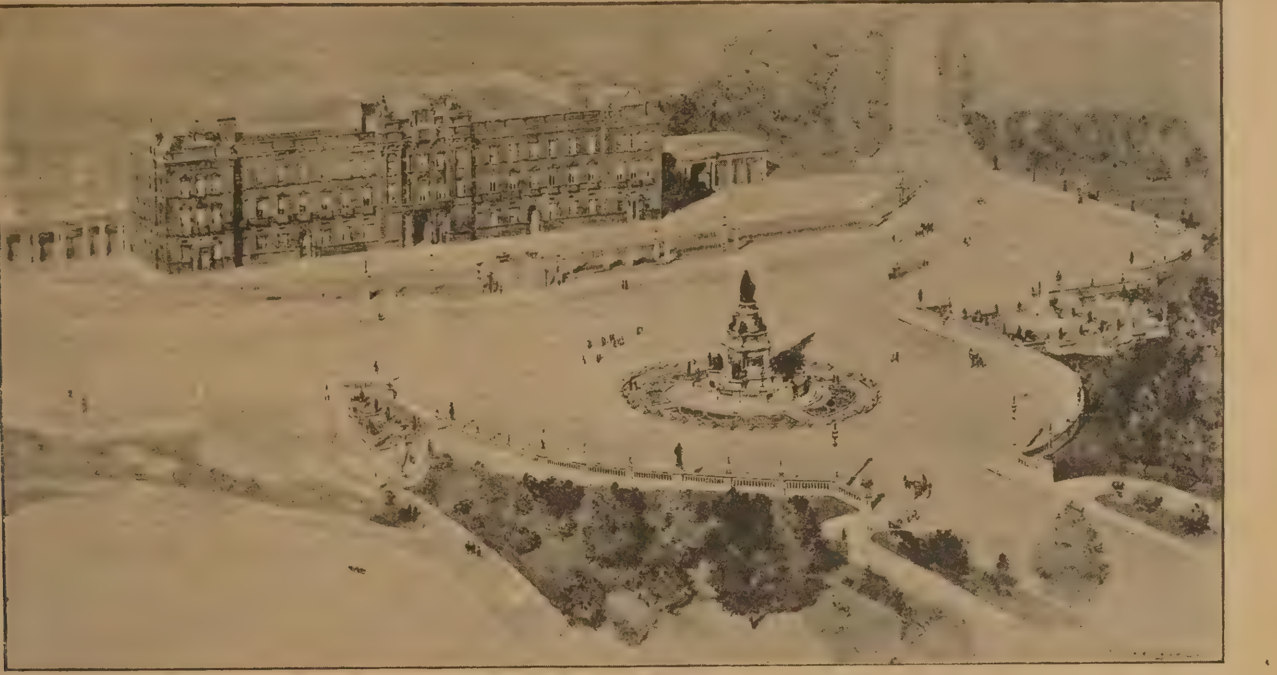
Theatre-Control.

And now for the second aspect of theatre-safety, namely, the question of the powers that be, of control generally, and of the London County Council in particular.

In the first place, I think we must all grant



QUEEN VICTORIA MEMORIAL. DESIGN BY T. G. JACKSON, R.A.



QUEEN VICTORIA MEMORIAL. DESIGN BY R. ROWAND ANDERSON, LL.D.

that the safety of the London theatre has improved materially from the playgoer's point of view since the London County Council was created. Although we have often heard the theatre-manager complain, more particularly in respect to old existing buildings which he has been required to alter, I must say that, as a class, the theatre-managers as I have met them are only too anxious to attend to the safety of the public, and that there has really never been any great difference of opinion between managers and the London County Council on the general question that the safety of the public must be attended to by some public authority.

Alterations to Old Theatres.

There is, however, one grave fault to find with the present state of affairs in London under the auspices of the London County Council, and that is the method by which safety is obtained in old theatres. I am afraid that, owing to the London County Council not being vested with sufficient authority to deal once and for all with the question of safety in existing old theatres, the theatre-managers have justly the very great grievance that they are constantly being worried and troubled by the authorities, and that they can obtain no finality as to what has to be done to bring their houses up to a certain standard of security.

It is this policy of worrying the managers of old theatres for improvements from time to time that has of late made that body so unpopular in the theatrical world; but there has also been the standing grievance that the policy of the Council on technical requirements varies every few years, and that improvements that may have been ordered in one year are not considered desirable in the next, the result being that the officials of the Council are blamed for not being consequential.

Personally, I think there would not be half so much cause of complaint with the London County Council's administration if its powers had been greater in the first place and, secondly, if greater discretion had been left to its chief permanent officials, and more particularly to the official holding the post of superintending architect, an official who is so often the arbiter of grave technical questions under the general Building Act, and certainly holds the full confidence of the technical professions. I am convinced that if our local authorities after the theatre catastrophes of 1881 and 1887 had had the necessary powers, had boldly acted upon them, and had insisted upon as many improvements as were possible in the various theatres, allowing, in the first place, the theatre-owner a certain number of years to carry out the improvement, and, secondly, guaranteeing him finality in the decision, the managers of theatres existing at the time would have willingly assisted the authorities in bringing their buildings up to modern requirements, whilst those erecting new theatres would have arranged their financial programme to meet modern requirements.

A Central Control by Government.

Sooner or later the London County Council, the theatre-managers and the public will appreciate that it will be in the interests of the community at large for the whole licensing question, whether relating specifically to theatres, music-halls, or other places of public amusement, to be subject to the central control by a Crown or Government authority. Whether, given a central authority, this central authority should delegate certain of its powers to the London County Council, the provincial county councils, or other local authorities, on lines not dissimilar to the administration of the Factory Act; or whether the central authority should take direct control, as often exercised by the Board of Trade in other departments of public life, is a matter for consideration, but one thing is absolutely certain, that the principles, methods and powers of control require revision and bringing into line for the whole of the United Kingdom, and, I may say, the Empire. Other countries have already found it necessary to adopt the principle of a controlling centre, and the experience already gained in that direction has been highly satisfactory.

You are, of course, aware that Select Committees of the House of Commons have sat upon this subject of control in 1866 and in 1892, when much valuable information was gathered but very little practical improvement or reform came.

A Suggestion.

Bearing in mind what I said earlier in the evening concerning the necessary investigation of the actual essentials of theatre safety, I venture to tender with all due respect the proposal that the Lord Chamberlain, who has always enjoyed so much confidence, should appoint a special commission, which, after due personal inspection of existing theatres both at home and abroad, and due examination of the rules and regulations in Great Britain, in the colonies, and in foreign countries, should draft some practical scheme by which the essentials of theatre-safety might be obtained and some practical scheme for control and administration be formulated. Such an independent commission should comprise at least an architect, a surveyor, an engineer, a fire-expert, a lawyer, a business man, a theatre-manager and an actor. Such commissions have been created, both in the United States and on the Continent, after great theatre catastrophes, and have done excellent work.

I think, gentlemen, it would be better to have this investigation taken in hand immediately, without waiting for a repetition of the Exeter theatre fire or the repetition of some other great catastrophe. I am convinced that such a commission could do more for the subject than any further Parliamentary committees, and that the reference to this commission should simply be: (1) What are the essential requirements for theatre-safety? (2) What system of control would meet the requirements of the United Kingdom and the Metropolis in particular?

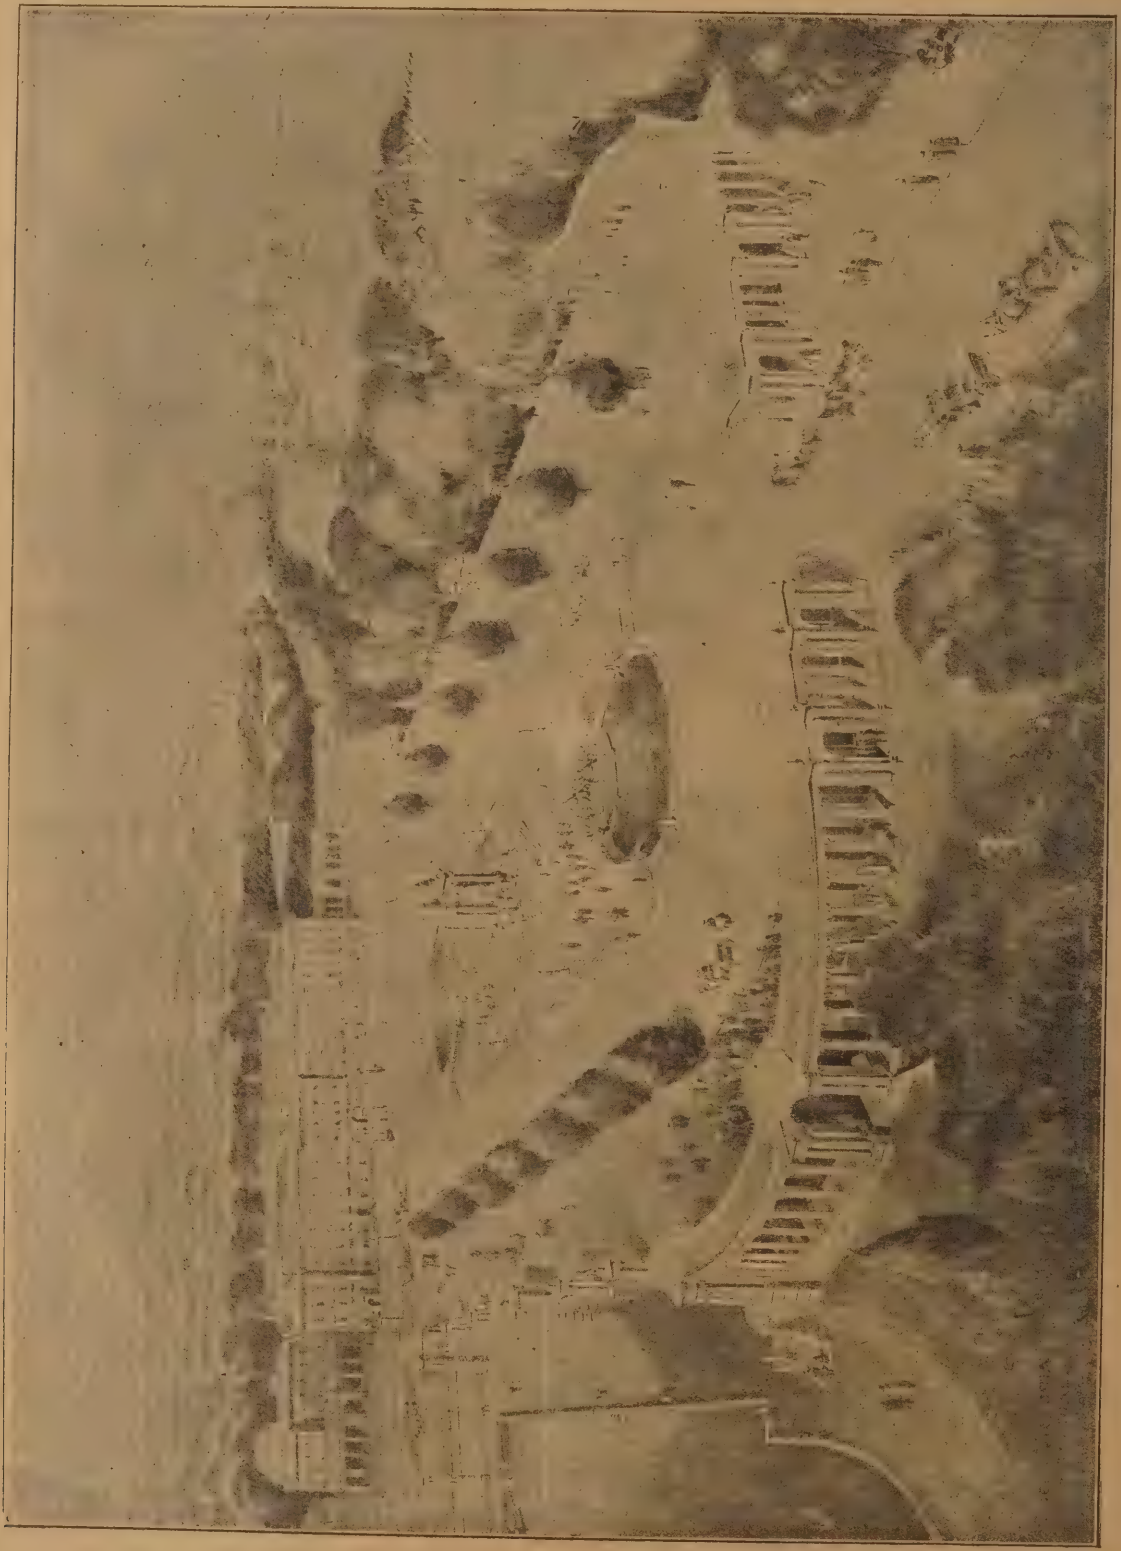
The discussion which followed added little of value. The chairman said he had written to numerous theatre-managers, and the majority of those who replied expressed the opinion that it would be better if the entire control of theatres were vested in the Lord Chamberlain. One only, Mrs. Langtry, preferred the London County Council; and she also thought the moral support of a fireproof curtain was immense. She had been in three bad theatrical fires in America, and in one case, in Oswego, New York, the theatre was burnt down in fifteen minutes, and the people displayed absolute calmness. Mr. Leven Sharp, L.C.C., the architect of the new Apollo Theatre, thought the County Council regulations were model ones and that it was the Council that was the only reasonable controlling authority, for an elective body was better than a Government one. A building built in conformity with the London County Council's regulations was as safe as any on the Continent. Major Fox, of the Salvage Corps, said constant inspection was the life and soul of safety. He thought there should be uniform regulations for the whole country. During the last six years no loss of life had occurred in London theatres, tending to show that the London County Council's regulations had proved effective. Mr. John Colman thought that every theatre ought always to be built with an open space on all sides. He considered that the County Council was the proper body to exercise control.

Queen Victoria Memorial.—Tickets of admission to St. James's Palace can only be obtained at the entrance in Colour Court during the hours the exhibition is open to the public, namely, 10 a.m. to 4 p.m.

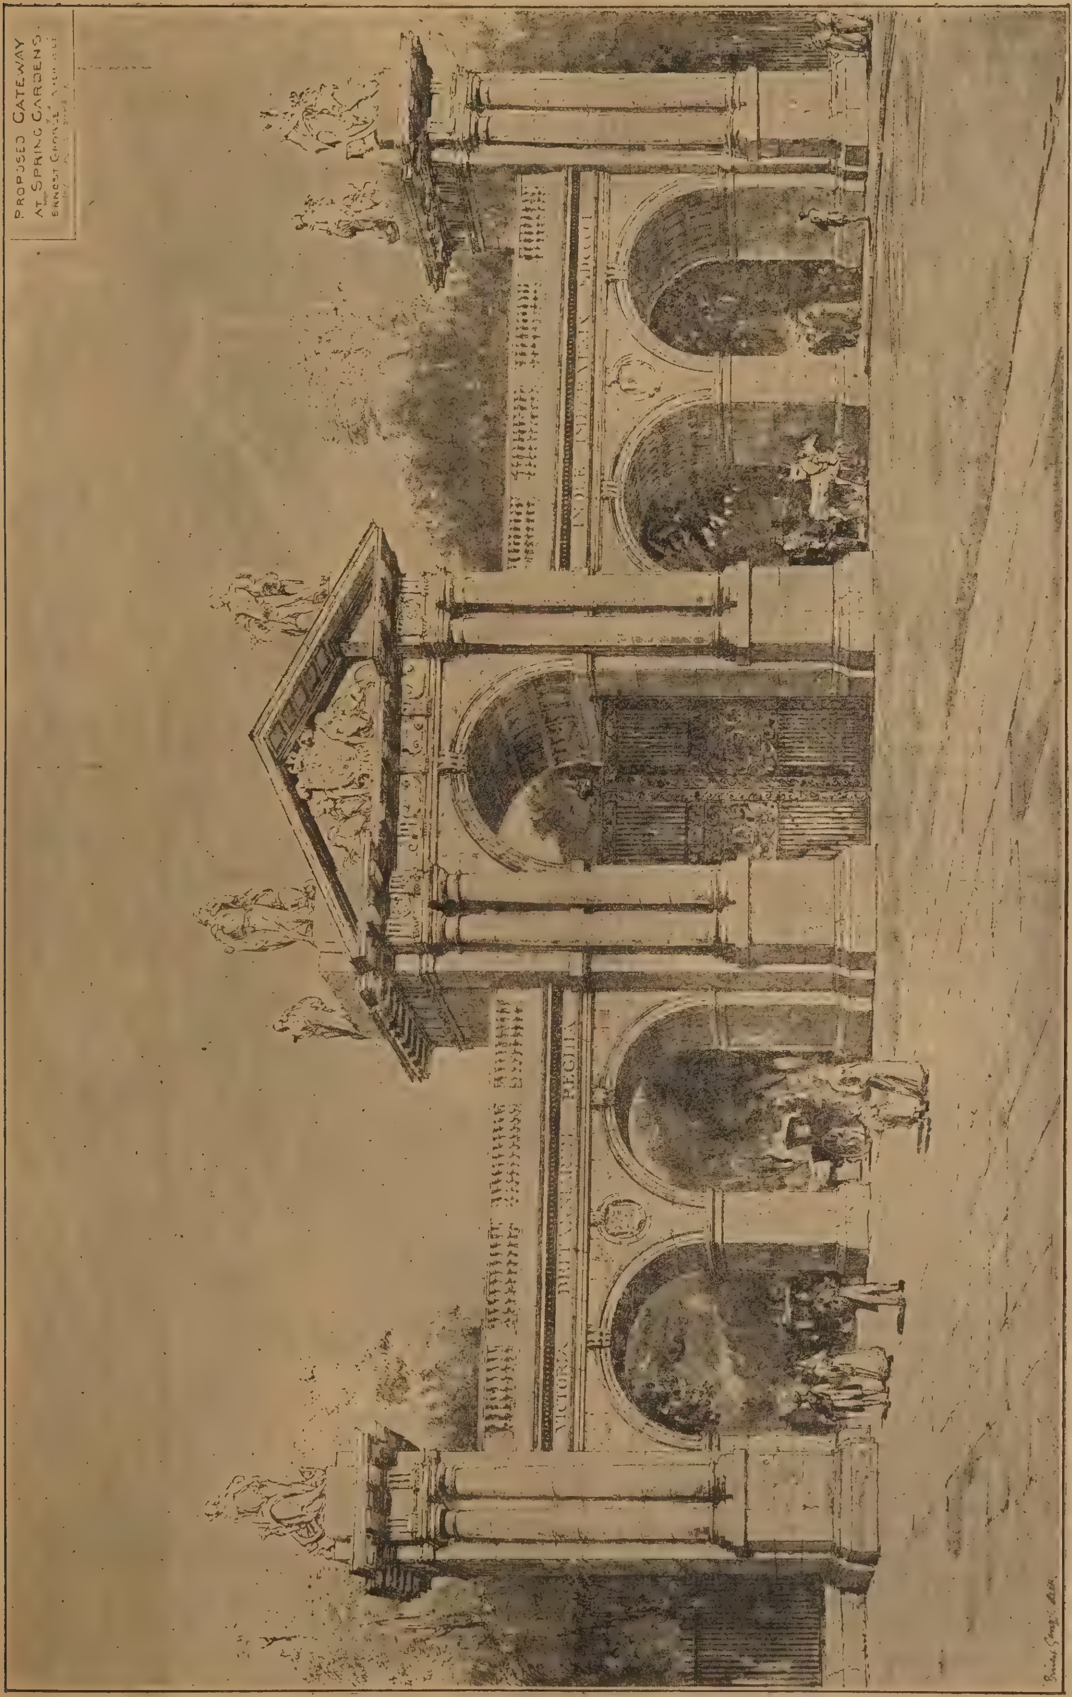
An American Lady Architect.—The American girl has entered the profession of architecture in France. Miss Julia Morgan, who belongs to San Francisco, has just won honours in the architects' section at the examination of the French Academy of Fine Arts. She means to practise her profession.

ST. JOHN'S CHURCH, LINCOLN.

ST. JOHN THE BAPTIST Church Lincoln, was re-opened recently after restoration. The church was, as far as possible, restored in the year 1856, at a cost of £600. Since 1898 a great deal has been done to brighten the interior of the edifice. In the last year named a dry area was formed on the north and east sides, and in the following year the south porch, with stepway and entrance from St. John's Street, was completed, while other improvements were carried out at the same time in the way of the rearrangement of the font and seats, curtains, gas lamps outside, &c. This year another important step was taken, and a contract was entered into for a thorough restoration of the chancel roof and for the removal of paint and colour from the walls. It was then found that the rafters and main timbers were much decayed, and the stonework of windows and arches was found to be so mutilated as to necessitate complete renewal in places. It was decided that the opportunity should be taken for cleaning the whole body of the church in the same manner and at the same time as that of the chancel. A close examination of the roof revealed the same serious state of decay in the north and south aisles as that found in the chancel. The south aisle roof from end to end has been made secure by means of new oak plates and stone corbels in connection with the clearstory wall, and some of its architectural features have been restored. The same necessity for repair was found at the east end of the north aisle, and it has received similar attention. The wall surfaces have been divested of all extraneous colouring and paint, showing up the moulded and Ashlar face stonework. The walls were not re-pointed but re-plastered. The chancel roof's architectural features have been restored, and the solid oakwork thereof gilded and painted. The sham stucco-work of the walls has given place to stonework following the lines of the ancient construction of windows, jambs and arches. The floor-levels and steps of the sacrarium have been readjusted, and the opportunity has been taken of laying a new floor in Rust's virtreous mosaic work with half-polished texture. Two new gas pendants supplied by Messrs. Elgood Brothers, of Leicester, have taken the place of the old wall brackets and are of design of the Georgian period. The general gasfitting of the church has been set in order by Mr. G. Bacon. The dossal hangings and side curtains were supplied and fitted up by Messrs. Jarvis & Co., of Stamford. The general builder's work has been carried out by Messrs. Roberts Brothers, under the direction of Mr. J. C. Traylen, architect, the surveyor for the diocese of Lincoln. The cost of the work is estimated at about £350.



QUEEN VICTORIA MEMORIAL. DESIGN BY ERNEST GEORGE.



QUEEN VICTORIA MEMORIAL. DESIGN BY ERNEST GEORGE.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"It cannot be imagined that either the back streets of our manufacturing towns, or the designs of our suburban villas, are things which the angels desire to look into; . . . . . but we should at least possess as much unconscious art as the lower brutes, and build nests which shall be, for ourselves, entirely convenient, and may perhaps in the eyes of superior beings appear more beautiful than to our own."—RUSKIN.

Grounds for Painting. PROFESSOR CHURCH, F.R.S., recently delivered a lecture at the Royal Academy on "Grounds for Painting." He dealt with the qualities and composition of paper, plaster for fresco-painting, canvas, panels and priming. Speaking of papers for water-colour painting the Professor dwelt on the great superiority of those made from linen. He said that in a linen-made paper the hardness of the flax fibre made it easy for the artist to cut out a high light, and if it were necessary to paint over it again the colour would take well on the damaged surface. Yet, in spite of the superiority of linen, cotton was the basis of nearly all the drawing-papers of commerce, and Professor Church made the somewhat surprising statement that only one paper was made of linen. Turning to plaster grounds, he stated that impure sand caused more trouble than anything else, and gave a simple test that would enable the fresco painter to detect the presence of salt in sand.

Another Cretan Palace. FURTHER reports have now been received about the important discovery by Italian archæologists of another royal palace in Crete, at Phaistos. The palace is of the Mycenæan period, or about 1500 B.C., and its ruins are in many respects even more interesting than those discovered at Knossos last year by English archæologists. The ruins of the palace are situated two hours' journey from the ancient town of Gortys, known as containing the longest Greek inscription extant. It is built on the spur of a high mountain chain, a site characteristic of nearly all the Mycenæan fortresses. Two parts of the excavated palace are of special importance. One is a large enclosure, on one side of which is a terrace wall and on the other a flight of stairs. As these stairs end in a closed wall, it is supposed that they must have been intended for the accommodation of spectators witnessing processions and dramatic representations on the space below. Here, therefore, we may have an example of the oldest Greek theatre. A small building, consisting of two low chambers, with benches along the walls, is connected with the enclosure, and from the chambers the way leads through two corridors to a large square, beyond which is a staircase from thirteen to fourteen mètres wide, and then through an *atrium* into a large hall, supposed to be the Megaron, or throne-room of the monarch. Two doors open into the hall, the ceiling of which is supported by three huge wooden pillars. Leaving this hall one enters other corridors, and then up more stairs, a second hall, with four pillars, which is thought to have been the women's room. The numerous corridors and stairs at Phaistos are especially noticeable. So far, fewer remains have been discovered than at Knossos. The palace seems to have been looted at some earlier date, but enough has been found to show that the excavations are exceedingly instructive. But only a portion of the palace has been uncovered, and it is therefore possible that future researches may bring unexpected treasures to light.

A Village Memorial. A MONUMENT at Eamont Bridge has been erected to the two men from the village who were killed at the action of Fabers Put, May 30th, 1900. The memorial to the men—Privates John Hindson and William Todd—has been erected on the site known as Arthur's Round Table, and is in the angle of the roads leading to Penrith, Shap and Ullswater. It consists of two chamfered bases, with a tapering die supporting the plinth, which is surmounted by a Celtic cross. In the face of the shaft of the cross are bronze portraits in alto-relief of the fallen yeomen, and in the upper part is a panel of intricate interlaced work, after the style of the Runic knot. This is also continued round the wheel of the cross. There are four bosses, standing 4½in. from the face of the upper part of the cross, finely carved. The carved panels and the portraits are divided by a beading. The back and sides are plain. The memorial rises to a height of 12ft., and stands on a base 4ft. 2½in. by 4ft. 9½in. It is surrounded by substantial iron rails, supported by four massive corner posts. The work has been executed in Silurian green Elterwater stone, quarried about two miles from Langdale Pike, Ambleside. The cross was hewn in one block, which is the largest that has yet been quarried at Elterwater. It measured in the rough 13ft. by 3ft. 6in. by 1ft. 6in. The monument was designed by Mr. W. Grant Stephenson, R.S.A., Edinburgh, who modelled and cast the bronze portraits. The remainder of the work was entirely carried out by Mr. W. Grisenthwaite at his monumental works, Penrith, under the supervision of Mr. G. Monk.

Truro Cathedral. THE cracking of the Bath-stone bases of the piers of the nave now being built does not appear so serious as at first stated. Precentor Donaldson, one of the committee secretaries, says that it is absurd to describe the cathedral or any part of it as unstable. Since the cracks were first noticed, in June, they have not spread in any way, and they are so slight that only experts would notice them. The architect, the contractor and the clerk of the works are unanimous in their opinion that the foundations are perfectly secure. There are no cracks in the arches of the nave or clearstory, or other signs of settlement in the building, and the cracks are almost entirely confined to the bases of several pillars. The cause of the cracks has not yet been arrived at definitely. The architect thinks they were caused by the plinth stones resting on an uneven surface. An expert will be called in by the architect and another by the committee, and they will make an investigation in conjunction with the architect, the contractor and the committee. When the experts report, the great question the committee will have to consider is whether it is necessary to remove the bases and put in others. It would be a somewhat difficult operation to shore up the weight above while that was being done, but that may not be necessary. It may be found that the cracks are due to something purely local to those particular pieces of stone, and that the whole thing means nothing more than that the appearance, to an experienced eye, will be somewhat spoilt. There is no sign whatever of the stability of the building being in danger.

Sir William Richmond on Church-Decoration. AT the Hammersmith Town Hall last week a lecture on church-decoration was delivered by Sir William Richmond, R.A. The proceeds of the lecture went towards the fund for beautifying St. Peter's Church. Observing at the outset that the divorcing of colour from architecture and sculpture had been a comparatively recent event—occurring, roughly speaking, 250 years ago, when what was called the revival of the Classic style, but which might be more truly named the sham Classic style, took place—Sir W. Richmond put forward a plea for the restoration of colour in church-decoration. He said the sham style was one cause of the divorcing of colour from architecture. England was rich in her painted churches, Saxon, Norman and others, right up to the sixteenth century. He instanced a number of cathedrals and churches in England where traces of colouring still remained. He believed that art and its services to religion would be revived in this country, although not on the same lines as formerly. It would come when all desired that the highest form of beauty should be connected with worship as well as with the buildings set apart for that purpose. It was said that costly decorations in churches were at variance with the simplicity of Protestant worship. The Puritans of former days, and many now, considered that nothing but the inward mind should be cultivated, that all outer aids to faith were obstruction and follies. They had the authority and example of the Primitive Christian Church, which the Puritans pretended to copy, to sanction the most costly and elaborate structures and the decoration of them for the service of religion. The best should have the best given to it. And what better could man give to religion than his art, his industry, his genius, indeed, all that the Divine Creator had implanted in him—his intellect and his skill?

Masters and Men.

The Strike of Swansea Builders' Labourers, which has lasted for twenty-seven weeks and has cost the Gasworkers and General Labourers' Union £2,400 in strike-pay, came to an end last Wednesday, the men looking for work unconditionally.

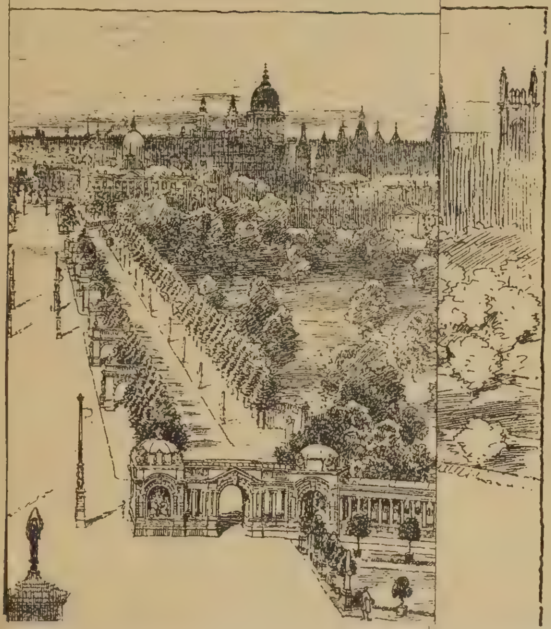
The Decline in the Building Trade of the country generally, which is attributed to the effect of the war and the continued high price of materials and labour, has caused several of the leading associations connected with the National Federation of Building Trade Employers to give notices to the workmen of a reduction of wages. At Birmingham the trade union representatives of the carpenters and joiners, masons, bricklayers, plasterers and labourers have been notified of a reduction to come into operation next year. The employers also assert that in order that the trade may be revived and kept in as prosperous a condition as possible, certain rules, uniform in terms, should be introduced into all trades connected with the industry. Meetings of the operatives are to be held immediately to consider the employers' proposals.

Engineering Notes.

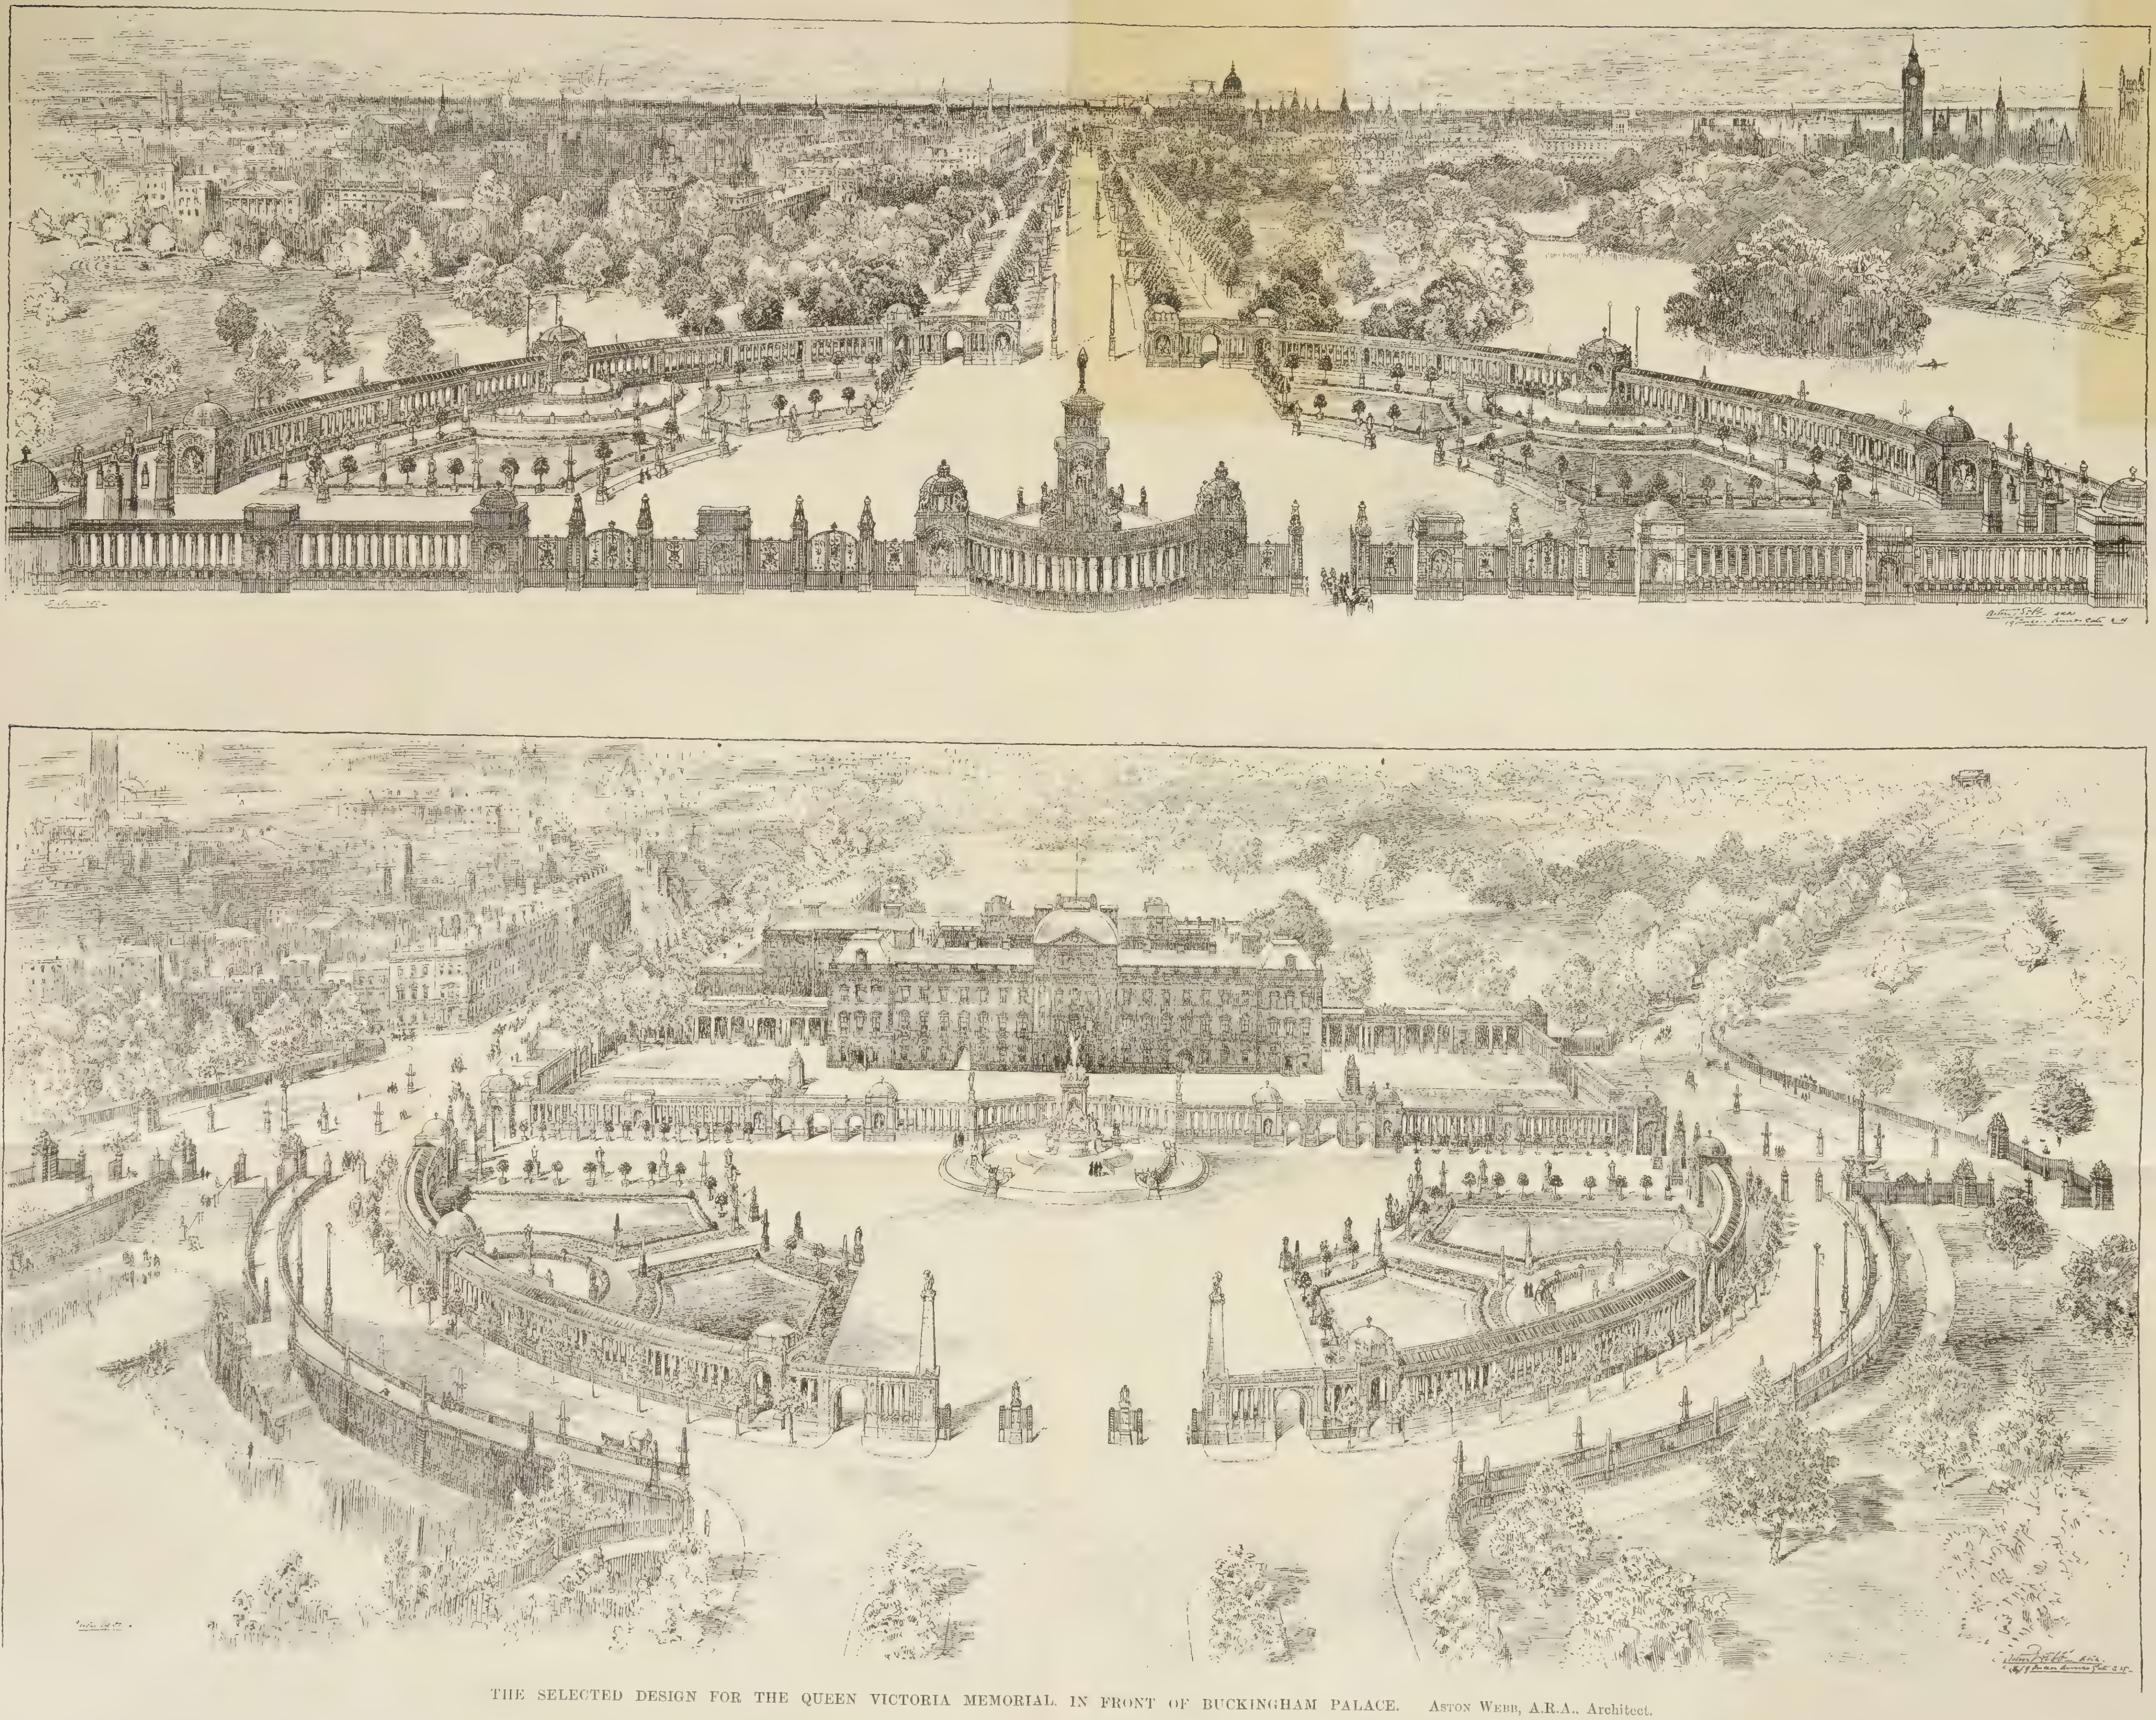
The Dryslwyn Bridge over the Towy was opened recently by the Countess Cawdor. It has been erected at a total cost of £12,000. The bridge is 17ft. wide, and built of limestone from Castellgarreg, Maesybont.

The Electric Light in St. Paul's.—It has transpired that the whole of the cost of placing an electric light installation in the interior of St. Paul's Cathedral in substitution for the present gas installation has been undertaken by Mr. Pierpont Morgan, and it will cost about £9,000. The light will probably be switched on for the first time in February next.

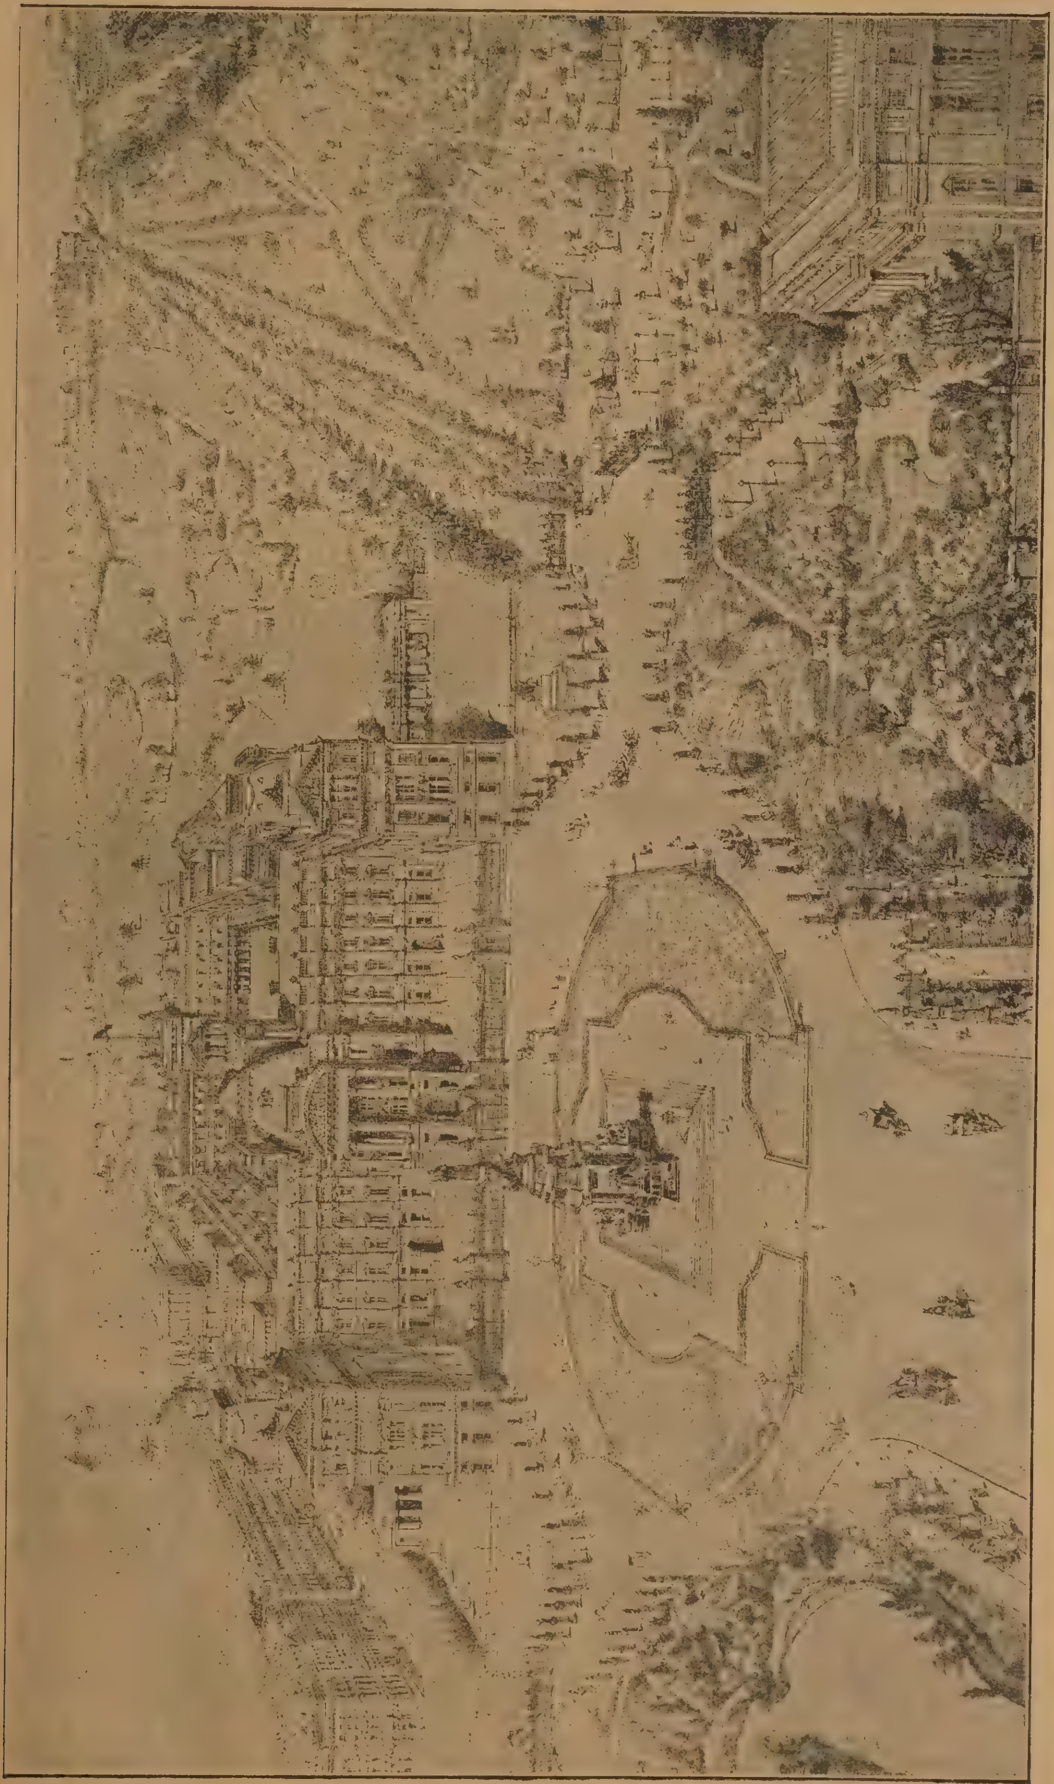
A New Shank Bridge in Mid-Lothian on Arniston roadway has been erected at a cost of over £9,000. Messrs. Alexander Findlay & Co., Ltd., Motherwell, were the contractors for the work; but the removal of the old bridge and the masonry of the new one were carried out by Mr. Stephen Hair, of Dalkeith; and the tar-macadam and paving were done by Messrs. W. Walker & Sons, of Ayr and Leith. Messrs. Crouch & Hogg, Glasgow, prepared the plans for the new bridge. It was found that the piers of the old bridge, which are very massive, could be repaired, and it was therefore decided only to take down the arches to the springing level and to erect braced stools upon them for carrying the girders. These stools are about 28ft. high, and are formed of four rectangular columns braced together and bolted to granite-bearing stones built into the piers, which have been thoroughly repaired. A bearing girder is fixed on the top of each stool, on which the longitudinal girders rest. The superstructure consists of two longitudinal plate girders, on the top of which trough floorings laid, and there is a lattice parapet on each side. Cement concrete is laid in and over this troughing, and the roadway is formed of tar-macadam, with tar paving on the footway. Cast-iron pilasters are placed over each pier, and castellated masonry pilasters on the abutments at either end of the bridge. The spans of the girders are about 47ft., and the width of the bridge is 28ft. between the parapets, divided into a roadway 20ft wide, with a footpath on one side 6ft. wide and a recess of 2ft. on the other side. The total length of the new bridge is about 320ft., and the roadway is upwards of 60ft. above the channel of the Gore Water.



Supplement to
THE BUILDERS' JOURNAL AND ARCHITECTURAL RECORD,
Wednesday, November 6th, 1901.



THE SELECTED DESIGN FOR THE QUEEN VICTORIA MEMORIAL IN FRONT OF BUCKINGHAM PALACE. ASTON WEBB, A.R.A., Architect.



QUEEN VICTORIA MEMORIAL. DESIGN BY SIR THOMAS DREW, P.R.H.A.

Builders' Notes.

Mr. Richard Wyatt Skinner, of the firm of R. W. & J. Skinner, of Sidmouth, died recently.

Mr. John Inglis, joiner, of the firm of Messrs. A. Inglis & Sons, of Hawick and Jedburgh, died recently.

Mr. James Gowans Duncan, builder, died at his residence in Craigie recently at the age of seventy-two years.

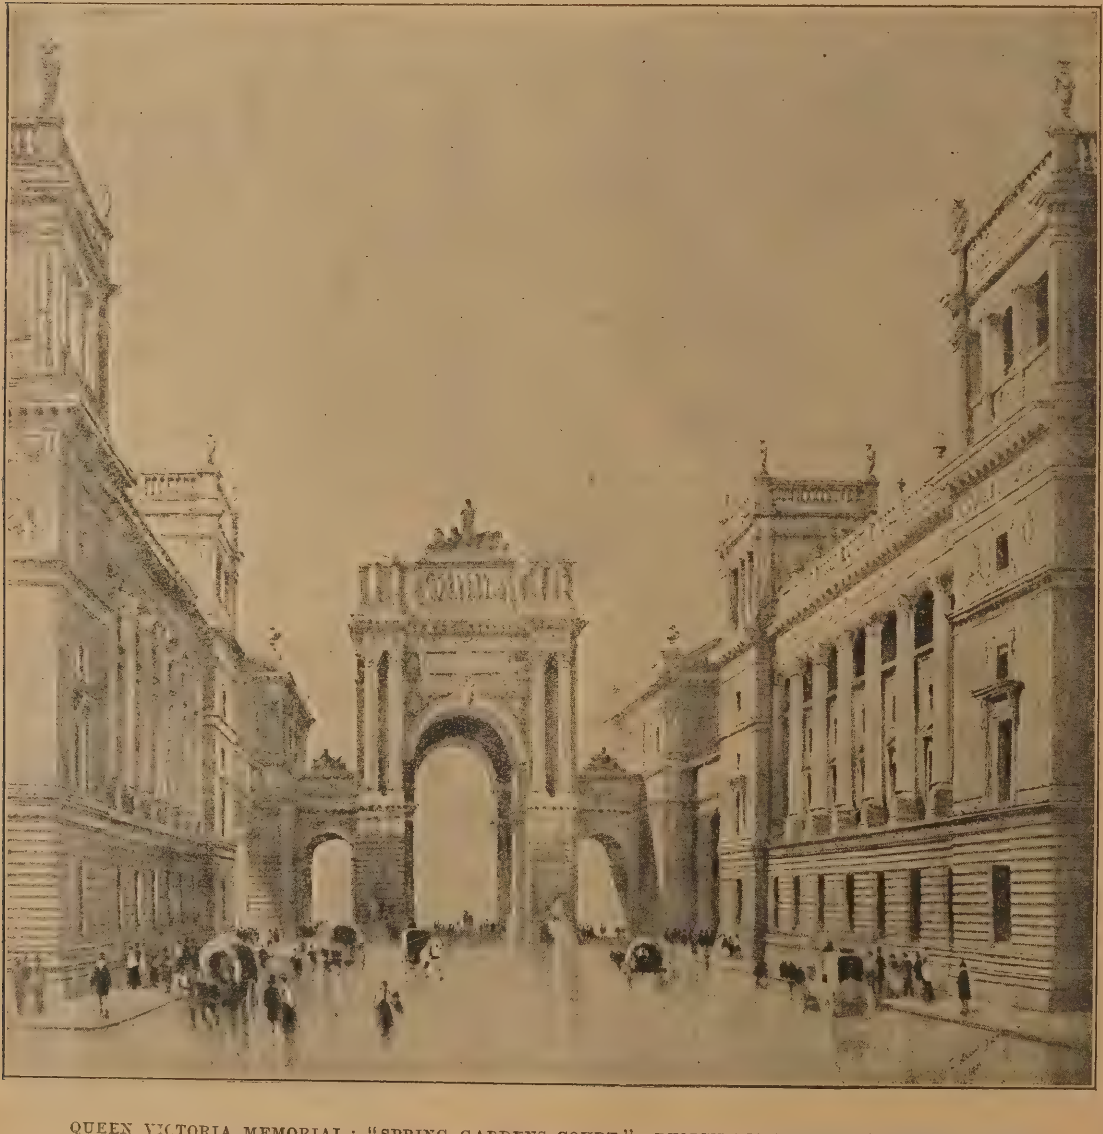
Mr. John Dow, junior partner of the firm of Messrs. William Dow & Sons, joiners, died recently. For some time past deceased practically managed the whole of the business.

Rochdale Building By-laws.—The building committee of the Rochdale Corporation has received a deputation from the Rochdale Housing Association, who have recommended that foundations of new houses be made more sanitary and the walls rendered damp-proof. They suggest that the ground surface should be asphalted. The building committee of the Rochdale Corporation promised to consider the subject at a future meeting.

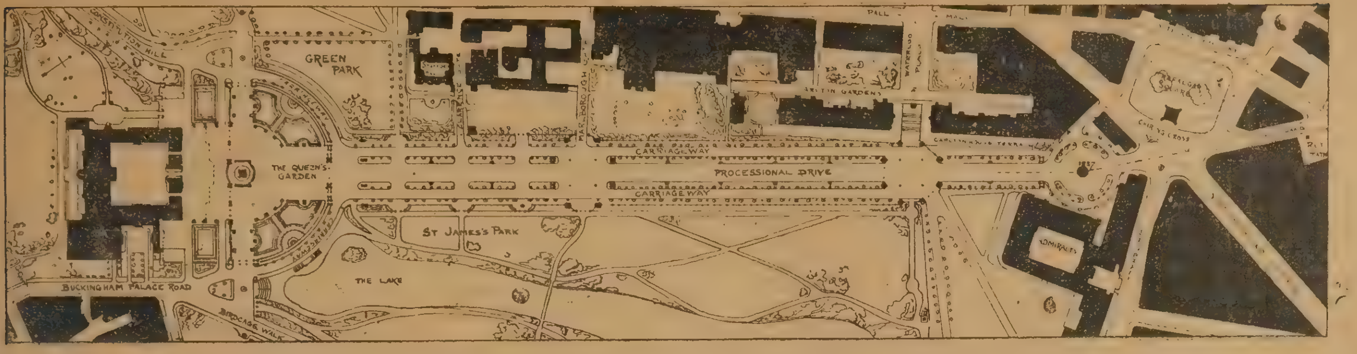
The Building Trade in many parts of Cheshire just now is at a standstill. Very little building has been going on during the summer, particularly in places where a remarkable growth had been witnessed, and at the present time there is absolutely nothing doing. Large numbers of joiners and labourers are idle, and builders complain that it is the quietest time known. A contractor in a large way declares that very little building was coming on, and that the outlook for the winter was an unpleasant one.

London County Council.—At last week's meeting a report was submitted by the General Purposes Committee, who had considered the applications for the appointment of chief engineer and county surveyor. From the thirty candidates they selected the following three to bring before the Council: Mr. Charles Elwin, general and Parliamentary assistant in the engineer's department of the Council; Mr. Maurice Fitzmaurice, chief engineer of the Assouan Nile Reservoir, and formerly resident engineer for the Council on the Blackwall Tunnel; and Mr. E. G. Mawbey, engineer and surveyor, of the county borough of Leicester. They recommended that Mr. Fitzmaurice be appointed to the post at a salary of £2,000 a year. This was agreed to. Mr. Fitzmaurice, it may be mentioned, served for eight years under Sir Benjamin Baker on the Forth Bridge. He has written two books, on bridges and bridge-work and on tunnelling.—The Housing of the Working Classes Committee reported King Street and Providence Place, Poplar, as insanitary areas, and recommended that these places should be cleared at a nett cost of £17,100. The estimated value of the cleared areas would be £1,500. Alderman Beachcroft moved an amendment referring the matter back to the committee for further consideration, but this was rejected and the recommendation approved.—On the recommendation of the Parks Committee it was resolved that the Council should contribute three-fourths (£30,000) of the cost of the proposed acquisition and laying-out of the land at Southfields, Fulham, for the purposes of a public open space.—Mr. A. Smith asked whether the City Corporation had asked the County Council to contribute half the cost of the proposed widening of Leadenhall Street, the estimated expenditure upon which was £360,000. Mr. Davies said a proposal had been submitted to the Improvements Committee from the City Corporation. A respectful reply had been made, and the valuer had been authorized to report upon the scheme.—The report of the Water Committee, proposing to introduce another Purchase Bill into Parliament on the same lines as that of last session, stood over for a week as the scheme involved an expenditure of more than £5,000.

The Teak Trade of Northern Siam.—The British capital invested in the teak forests of Northern Siam is about two millions sterling, and three-fifths of the total teak trade of the country is in British hands, the bulk of the remainder belonging to Chinese and Siamese. British foresters and British companies were the pioneers of the trade, and those now concerned in it have lately been caused some anxiety by a change in the old conditions and the concentration of the forest administration as well as the establishment of new rules by the authorities at Bangkok. There are two main channels for the trade, one down the Salwin to Moulmein, the other by the Me-nam and its tributaries to Bangkok. The timber floated down by the former, where the rains are plentiful and the valley deep, and reaches its destination in a month or two; by the Me-nam Valley the time taken is often more than a year. Nevertheless, the trade by the Salwin, according to the last report of the British Consul at Chieng-mai (Zimmé), has steadily decreased in the last three years, probably because of the indiscriminate felling of the Burmese and Shan foresters prior to the new leases of 1897, since which time the work of extraction has been restricted and controlled. On the Me-nam side there was a large and well-distributed rainfall, which floated out of the streams a large number of logs (as the stripped trunks are called) which had accumulated for years awaiting a favourable floating season, so that 120,000 full sized logs, valued at about £3 a log, reached Bangkok, the largest number in any previous year having been 73,000 in 1893. These logs having thus got beyond the boundaries of the forests, escaped confiscation under the provision that timber lying within the boundaries on the expiration of the lease becomes the lessor's property, and this gave great relief to the British companies and traders engaged in the staple industry of Northern Siam, who would otherwise have suffered heavy losses. But, on the whole, under the new leases and the new regulations for forest conservancy, the Council's opinion is that if the regulations are enforced with impartiality against all concerned, "British foresters and traders are entitled to anticipate, if not the same profits as heretofore, at least a maintenance in the future of the same proportion of the teak trade in their hands as in the past." Last year the value of the teak sent down the Salwin to Burma was over £75,000, that sent down the Me-nam and its tributaries about £350,000.



QUEEN VICTORIA MEMORIAL: "SPRING GARDENS COURT." DESIGN BY SIR THOMAS DREW, P.R.H.A.



PLAN OF THE ACCEPTED DESIGN FOR THE QUEEN VICTORIA MEMORIAL. ASTON WEBB, A.R.A., ARCHITECT.

THE CHURCHES AND COLLEGES OF CAMBRIDGE.

BY ALEXANDER WOOD, M.A., F.S.A.

A MEETING of the Architectural Association was held at 9, Conduit Street, W., on Friday evening last, the chair being taken by the president, Mr. Howard Seth-Smith. After the minutes of the last meeting had been read and confirmed, the chairman announced that it was proposed to nominate Mr. R. H. Weymouth to fill the vacancy on the committee created by Mr. Arthur T. Bolton's resignation prior to his appointment as headmaster of the Day School. The following were then elected members of the Association: A. Cecil M. Edwards (Rickmansworth), Edward F. Knight (London, E.C.), W. H. Hillyer (London, S.E.), H. Bailey (Anerley), J. H. Gott (London, S.W.), A. G. Parker (London, N.W.), H. L. Samson (London, S.W.), B. B. Hooper (London, S.W.), W. J. Parker (London, W.C.), J. H. Belfrage (London, W.), C. J. Calder (London, S.W.), J. C. Corblet (London, S.W.), J. H. Crabtree (London, N.E.), J. J. Crowe, junr. (Brentwood), L. H. Harrington (Bromley), A. J. Healey (London, N.W.), D. S. Jennings (Hammersmith), H. A. P. Pierce (London, E.C.), L. Roberts (Wimbledon), S. H. Stock (London, S.E.), F. A. Stowell (Pirbright), T. J. Tatham (London, N.), T. Thorne (Brockley, S.E.), G. F. Webb (Chislehurst), H. D. Aubrey (Chelmsford), A. B. Botterill (Streatham S.W.), W. B. Sinclair (Bexley), E. Chaplin (London, S.W.), R. B. Curwen (Woodford), M. E. Dixon (Wimbledon), J. V. Gibberd (Croydon), N. Hall (Walthamstow), C. R. G. Harrison (London, N.W.), C. McJerrow (London, N.W.), H. Kemp (New Malden), C. W. Kilner (London, W.), D. M. O'Connor (Southall), A. E. S. Payne (New Cross), P. Phipps (London, W.), G. A. Potts (Brixton Hill, S.W.), F. G. Russell (Tottenham, N.), S. M. Spoor (East Putney), E. G. Stevenson (West Norwood, S.E.), R. W. Suttle (Stepney, E.), W. J. Tomlinson (Pietermaritzburg, Natal), W. I. Travers (London, W.), C. F. Ward (Highgate, N.), R. H. Willson (Kingston-on-Thames), B. H. Sutton (London, W.C.).

Mr. Alexander Wood then read his paper on "Early and Mediæval Cambridge." He said:—

Early Cambridge.

About three miles from Cambridge the Gogmagog Hills rise above the surrounding country. From them a good view may be obtained over the plateau upon which the town stands. At this spot we are amid the defences which the East Anglians raised or utilised against their encroaching neighbour Mercia. The ground would have become debatable if it had not been strongly fortified on what may be called a trench-and-block-house system, the indications of which may be traced at the present day. The Great Dyke, known as the Recken Dyke, the Devil's Dyke, St. Edmund's Dyke, extended over Newmarket Heath from Reche upon the Cam towards the woods of Essex. Parallel with the Great Dyke, at a distance of seven miles, was the Fleam Dyke.

On the summit of Gogmagog Hills is a triple circular entrenchment enclosing about 13¼ acres, known as Vandlebury, which is, according to Gough, one of a chain of forts reaching from the woodland of Essex to the Fens.

But it is time to leave the Gogmagog Hills and follow the Roman road to Cambridge.

The outline of the Roman Camboritum can be readily and clearly traced. The western wall went from what is known as Mount Pleasant, and enclosing the little church of St. Peter and its churchyard, ran to a point near the old Norman Grange, known as the School of Pythagoras, where the southern side began and crossed Magdalene Street by the south side of the Chesterton Road, the terrace in Magdalene College grounds forming part of the rampart. The eastern wall began a little beyond the college grounds and proceeded to Akeman Street, the Roman road, in the vicinity of the present Victoria Road.

At the extremity of the natural promontory enclosed by, though not as extensive as, the the Roman camp stands the mote or mound specifically known as the Castle Hill, which gives the popular name of Castle End to this outlying north-western part of Cambridge.

William the Conqueror erected a castle at Reche and another at Wisbeach. In 1069 he took up his residence in the Castle of Cambridge, whence he conducted his military operations against the Isle of Ely, where Hereward, the so-called last of the Saxons, maintained the struggle against him. The last remaining relic of the castle, the gateway, was pulled down almost in our own day to build the county courts.

In the neighbourhood of the Castle of Cambridge was

The So-called School of Pythagoras.

This never was a school, and had nothing to do with Pythagoras. It appears to have been a farmhouse or grange of the twelfth or early part of the thirteenth century. The manor-houses of this period were usually in the form of a parallelogram, and of two storeys in height. The lower storey appears to have been invariably vaulted. There was no internal access from the lower to the upper storey, the communication being by an external flight of steps such as we see at the King's School at Canterbury. In the upper storey was at times the only fireplace in the building. Wealthy Jews appear to have been the first builders of stone houses in this country, as is seen in the Jews' house or houses at Lincoln and Moysey's Hall at Bury St. Edmunds. To the rooms above mentioned were frequently added a cellar on the lower and the solar on the upper floor. The kitchen appears to have been in a courtyard external to the mansion.

The lower room of the "School of Pythagoras" is 60ft. in length. The vault has disappeared, and there only remain two vaulting shafts. Light is admitted by an inserted fourteenth-century window of two lights. The windows on the first floor are fair examples of Transition work.

In the history and constitution of the Guilds of Cambridge we may read the record of its early unfulfilled promise. Two Guilds—those of Corpus Christi and the Blessed Virgin—combined to found Corpus Christi College.

There were till lately several old houses in Cambridge, particularly in Bridge, Trinity Street, formerly the High Street, and the neighbourhood of the Petty Curry. The Jewry was in the parish of St. Sepulchre's. Some have thought that the Jews did not live in the Jewry, but that is a mistake. As a matter of fact, they constructed numerous stone houses in and about the Jewry at a time when the majority of houses were constructed of wood.

The Churches of Cambridge

would take a volume in themselves. To make the study of them intelligent one has to make a circuit of several miles round Cambridge, and even further than that at individual points, to trace their similarity to other churches in the same district. Thus what I have seen described as the singular tracery and form of the windows at St. Michael's, Cambridge, proves not to be singular when compared with that at Over, some miles to the north-west of Cambridge, which appears to be by the same architect or band of workmen.

I shall omit all notice of the most remarkable church in Cambridge, St. Sepulchre's in the Jewry, as that is well known and has been fully described as one of the round churches of England. I shall speak of those only which were connected with the colleges, and in doing so I shall take them in chronological order, as they existed in and were part of the town before the colleges were built.

The Oldest Church in Cambridge,

and the oldest building in the town, is St. Benedict's, or St. Bennet's, Church. Its situation is slightly to the west of the site of the Austin Friars, and immediately adjacent to Corpus Christi College. The body of the church was restored by Mr. R. Brandon, and exhibits few traces of its remote antiquity. The tower, however, remains intact. It is of that version of Early Romanesque which we commonly call Saxon. It is in diminishing stages, not in one upright mass, as the tower of St. Michael's, Oxford. The material is rough masonry, the quoins being in "long-and-short" work. Of the three stages of which the tower is composed the lowest occupies nearly half of the entire height. The nave is of the thirteenth century. The south aisle of the chancel is formed by a building that in mediæval times consisted of an upper and lower chapel, the former of which was used as a lecture-room.

Much the

Finest Example of First Pointed

in Cambridge is what is now, and has been since the early part of the sixteenth century, the Chapel of Jesus College, formerly that of the Nunnery of St. Rhadegund. It was erected between the years 1150 and 1245, the north transept being the oldest portion of the existing building. It was originally in the form of a cross, with a tower in the centre, and had, in addition to the transepts, aisles on the north and south sides of the eastern limb, flanking it along half the extent of its walls and forming chapels, which opened into the chancel by two pier arches in each wall. Of peculiar beauty are the piscina and sedilia; the series of lancet windows, with blind arcading between them, in the chancel; and the roof-storey gallery on the inner side of the tower walls. The piscina was thought so beautiful that it was copied in the parish church of Histon, to the north of Cambridge, and in the ancient hospital of St. John, where St. John's College now stands. The nave had seven piers on either side between it and the aisles. These piers were alternately cylindrical and octagonal. Upon this splendid fabric Bishop Alcock of Ely brought what was little else than ruin in transforming it into a college chapel. A considerable amount of his work has been undone in our own day, and there appears to be no reason beyond the expense that would be incurred to prevent the whole being brought back to its primitive condition.

The Cambridge example of

The Second Pointed Style

is the fine church of St. Mary-the-Less without Trumpington Gates, attributed to Alan of Walsingham, remarkable for its window tracery, and particularly for that of its east window, in which some see an approach to the Flamboyant character. It is a lofty body without aisles or any structural division between nave and chancel. The separation was effected by a screen. The length is 100ft. and the width 27ft. The church is divided into six bays, each of which, except the westernmost, is a double square on plan. The tracery of the windows on the north side is all modern, with the exception of that in the easternmost window. In the eastern gable and in that on the south side are windows the tracery of which is exceptionally rich and flowing. The tracery is in the same style and even from the same patterns as that of the same date in Ely Cathedral. In the fourth bay are traces of chantries both on north and south. The gallery connecting with the church is of the middle of the fourteenth century, at which date the choir was refitted. The new quadrangle of Peterhouse was built at the same time.

One might be tempted to think on entering a college that the chapel was the most important building, the first built, and that all the other buildings had clustered round it. That is not the historical fact. The least ambitious part, the chambers, comes first. The chamber, the hall, the chapel—such was the progressive development.

The Cambridge Schools.

We know the appearance of the Cambridge schools in the middle of the fifteenth century. On the north side of the quadrangle stood the Theology School, and on the west that of Canon Law, with the new library above it. To these on the south side were added the Schools of Philosophy and Civil Law. The whole building appears to have been completed in 1470 or 1471. The south building was entered by a *vice* or turret staircase at the north-east corner. It formed part of the east range containing the gateway—still preserved at Madingley, near Cambridge—which was begun in 1470.

These schools were the outfit of the mediæval University of Cambridge. They were confined to a single building. The colleges, on the other hand, were numerous.

It has been argued that the dispositions of a monastery were derived from those of a Roman villa, and in particular from those that partook both of the character of the town and country house, and this resemblance has been worked out in detail. The cloister, with its pillars surrounding an open court having apartments opening from it, is, it has been argued, clearly derived from the peristyle common to the Roman town house and the country mansion, which was the part of the house reserved for private use. The outer court, with its stables, granaries, &c., corresponds with the *villa rustica* of the Roman country house. The *tablinum* becomes the chapter-house. The kitchen and refectory are in both cases situated on the outer side of the court. It is easy to press the analogy too far, but there is an evident truth in it.

So it may be said that there is between the general plan and disposition of a college an analogy with that of a monastery.

The Colleges of Cambridge.

The colleges which fall within the mediæval period are fourteen in number.

St. Peter's, the earliest of the Cambridge colleges, was founded by Hugh de Balsham, Bishop of Ely, in 1284. He bequeathed funds which enabled his scholars to purchase land to the south of St. Peter's Church (now Little St. Mary's) and built upon it a handsome hall. The quadrangle was not begun until 1424. The buildings were then carried on continuously until about 1466.

Clare College was founded in 1326, and was originally known as "University Hall." This college does not appear to have been arranged upon the quadrangular plan until subsequently to the mediæval period. It is now wholly Renaissance, and the best specimen of that style in Cambridge.

Pembroke College is one of the four colleges founded in the middle of the reign of Edward III. The south side of the quadrangle was begun in the lifetime of the foundress, and the construction of the chapel—the first college chapel in Cambridge—was authorised by a Papal bull in 1355.

Gonville Hall was originally erected on another site, and transferred to the present one by William Bateman, bishop of Norwich. The chapel, occupying part of the south side, was built in 1393; the chambers that complete that side and form the west side in 1441; the east side was not built until 1490. The chapel was built with its east end free, no buildings abutting upon it.

Trinity Hall has the peculiarity of an entrance court interposed between the quadrangle and the street, like the *curia* of a monastery. The quadrangle is larger than in any previous college—115ft. long and 80ft. wide. The chapel is believed to have been built in the fifteenth century. Trinity Hall was a house of study for the monastery of Ely prior to its conversion into a college for the study of civil law.

Corpus Christi College, built between 1352 and 1377, exhibits the first regularly-planned close quadrangle, as it has a hall range on the south, containing the hall, kitchen, and master's lodge, and of chambers upon the other three sides The buildings are low and of equal height throughout. There was no chapel, but two parish churches, to either of which the students could resort.

The first stone of the old court of King's College was laid in 1441. The area was so cramped that the formation of a regular quadrangle could not be attempted. The first stone of the chapel for the enlarged foundation was laid in 1446. The design for the enlarged college was never executed, and the large southern quadrangle has sprung up in quite modern times. A closed quadrangle was contemplated, of which the chapel would have formed the north side; the west side would have been occupied by the library, the hall, and the Provost's lodge; the south and east sides by chambers. Westward of the chapel would have been a cloister, like Wykeham's at Winchester, and New College, Oxford, with a lofy detached campanile.

King's College was founded by King Henry VI. in 1441. Two years later the king's plan was greatly extended. The college was not completed by either Henry VI. Edward IV. or Richard III., but by Henry VII.

Queen's College was founded by Margaret of Anjou in 1448. The principal quadrangle was completely designed and finished in a few years. It is entered on the east side, which, as also the south, is occupied by chambers. The hall, kitchen and buttery are on the west side, whilst the original chapel and the library were on the north. Soon after the erection of the great quadrangle a large range of buildings was erected to the west, with, what is an exceptional feature for Cambridge, a cloister-walk on the ground floor. The arches are plain four-centred arches of brickwork, of three chamfered orders.

Catherine Hall was founded in 1473. The buildings formed a quadrangle. The hall, library, and master's lodge were on the north side, and the chapel on the south, projecting eastward beyond the eastern range of chambers. This college was wholly rebuilt in the seventeenth and eighteenth centuries.

Jesus College was made into its present form from the pre-existing Nunnery of St. Rhadegund, about 1495. The distinctive features of this college are the cloister surrounding the original quadrangle inherited from the nunnery, the entrance court, and the road leading to the entrance-gateway and running between the walls of the Master's and Fellows' garden. The cloistered quadrangle was universal in monasteries, but not to be found in colleges, except in their secondary courts. In ecclesiastical buildings the Vicar's Close at Wells presents a near analogy to the ordinary college quadrangle.

Christ's College was built on the site of a hostel called God's House. Margaret, Countess of Richmond and Derby, obtained a licence to complete the college, gave it a body of statutes, and lived to see the quadrangle completed. The chapel occupies part of the north side, but extends beyond the eastern range of buildings. The remainder of the north side, the whole of the south side, and the greater part of the west is occupied by chambers. The library is on the first floor, on the west side, to the south of the gateway. The buildings have been much transformed externally, but the ancient structure remains.

Trinity College sprang up from a variety of hostels, of none of which are there now any but the most fragmentary remains. The history of this noble college itself falls without our period.

Magdalene College stands apart in more senses than one. It occupies the site of an ancient Benedictine establishment, dating from 1428. Different religious houses built different portions; Ely built one chamber, Walden a second, Ramsey a third. The buildings, with the exception of the Pepysian Library, were completed before the end of the sixteenth century. In the quadrangle of Magdalene is to be observed the corner staircase turret, a feature of Cambridge but not of Oxford Colleges. The entrance gateway is unaccompanied by a tower. The hall, butteries and kitchen occupy the east side; the hall being at the north end and the kitchen extending to the external south boundary of the buildings. On the north side is the chapel next the hall; the remainder was formerly occupied by the master's lodge.

A vote of thanks to the lecturer was proposed by Mr. Butler Wilson and seconded by Mr. Francis Hooper, and the meeting then ended.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Inexpensive Balcony.

LONDON, W.—IGNORAMUS writes: "How could I obtain an inexpensive balcony for a small house?"

An inexpensive balcony might be constructed with strong wooden brackets resting on corbels. On this a pitchpine floor could be placed, with wooden balustrade. The outer overhanging edge of this floor should be tied in with an iron strap running along its upper surface with an iron plate on the inside of the wall, or an artistically wrought iron stay can be used instead to support the outer end of the balcony. If something more substantial is required, an iron balcony might be used, names of makers of which can be obtained from our advertisement columns; or a light stone balcony, with stone slabs on iron or steel cantilevers or brackets and a light balustrade, could be adopted.

Proprietorship of Plans, Specifications and Quantities.

CARLISLE.—W. E. writes: "When tenders are sent to an architect who is employed to prepare plans and take out quantities, and the job let, are the plans and priced quantities his property or his client's, the architect being paid for his work?"

The question is a very debatable one, and we know of no legal decision that gives a definite answer, but as a matter of opinion we do not think the client is entitled to claim the plans, quantities or tenders. Special attention should be paid to the fact that the architect is engaged as a professional adviser to supervise the carrying out of building work, and it is quite possible for him to do this without preparing plans, or even a specification for that matter. His expert knowledge is not purchased by the client outright, the architect being in the same position as the doctor, lawyer or painter, whose notes, sketches and memoranda, it would be foolish to expect to be delivered up to their clients. In fact, it appears to us that if the drawings, &c., are the property of the client, it would logically follow that the sketches and memoranda, the architect's stock-in-trade, should be delivered up also, which is absurd. When the client gets his building completed the contract is fulfilled and he can claim nothing else. If he does not proceed so far as this the loss is his and not the architect's, for if the plans were the property of the client before the building was begun, they would also be his afterwards, and this, as we have seen, is not right. Of course the architect can, if he chooses, sell the plans outright by special contract. However, it would be always best to get the client to agree in writing to the architect retaining the drawings to insure himself. Of course, no architect would reasonably object to letting an honest client have a copy of the plans for use in executing necessary repairs at any time, such as to show position of drains and gas- and water-pipes. An architect can, if he choose, protect himself against his plans being used elsewhere by copyrighting them.

Jointing Materials.

QUERIST writes: "Which is the best material for making a joint of iron casements in a stone window? What is the best joint in good work for the coping of a stone-terrace balustrade?"

The jointing material may be neat cement, or equal proportions of cement and sand, for bedding iron casements in a stone window. Any holdfasts may be run with lead if preferred to liquid cement. The bad reputation of lead in contact with iron is chiefly due to the corrosion at the foot of iron railings run with lead, where the deterioration is, however, due more to the fact of moisture staying longer in contact with the metal at that part, owing to the dust that collects there. For the coping (moulded or plain) of a stone-terrace balustrade "double-arris joggle with pebbles in cement" may be used, as shown in Fig. 1, or "dovetailed lead plugs run in," as shown in Fig. 2. H. ADAMS.

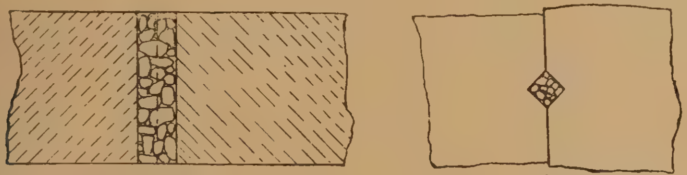


FIG. 1

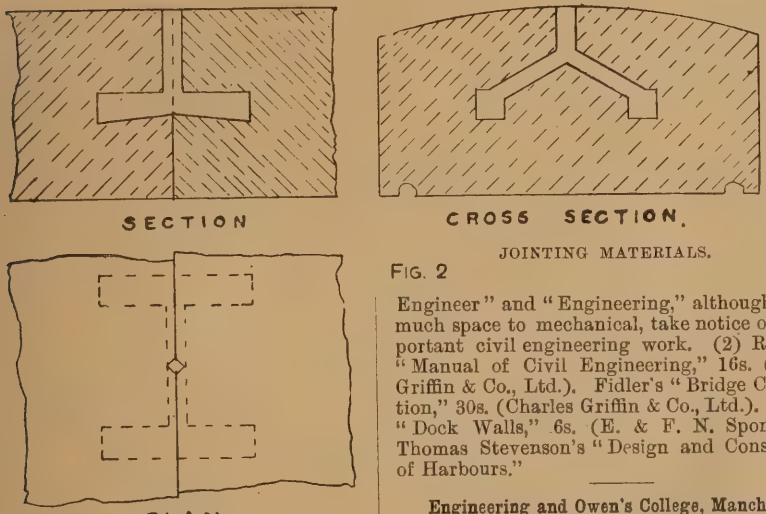

JOINTING MATERIALS.

FIG. 2

L.G.B. By-laws.

BIRMINGHAM.—H. B. writes: "Where can I obtain the Local Government Board's by-laws relating to isolation hospitals?"

The two "Memorandums" and the "Report" on isolation hospitals can be obtained from the King's Printers, Messrs. Eyre & Spottiswoode, East Harding Street, London, E.C., price 1d. each, and 10s., respectively. There are no "by-laws" relating to isolation hospitals published by the Local Government Board.

Urban District Council and Roads.

ROMFORD.—E. G. H. writes: "It is proposed to erect two villas on a plot measuring 1 acre, 1 rood, 14 poles. A certain lane is 22ft. wide, but the urban district council require a 36ft. road, the 14ft. to be given along the entire frontage. Can they enforce this? Ought not the measurement to be taken equally on each side from the centre of the road? Also, at what distance from the frontage must the building line be to be exempt from control of the urban district council so far as widening a road is concerned? Council have adopted Model By-laws.

We think, if you build, the council can force you to make the road in front 36ft. wide, by setting the frontage back 14ft., but if you can get the owner on the opposite side to give 7ft. up or purchase the opposite plots yourself and give up 7ft. on each side, we do not think the council could take 14ft. off one side unless they paid compensation. In the new Model Rural By-laws of the Local Government Board provision is made for equitable adjustment by stipulating that in the case of houses fronting existing narrow roads the distance shall be measured from the centre line of the street.

Civil Engineering.

SOUTHSEA.—J. H. M. writes: "(1) Is there a journal published dealing with civil engineering more than with mechanical engineering? (2) Please name a good work on this subject dealing especially with docks, bridges and breakwaters."

(1) We do not know of one. "The Surveyor," weekly, 3d., deals with municipal work. "The Engineer" and "Engineering," although giving much space to mechanical, take notice of all important civil engineering work. (2) Rankine's "Manual of Civil Engineering," 16s. (Charles Griffin & Co., Ltd.). Fidler's "Bridge Construction," 30s. (Charles Griffin & Co., Ltd.). Allen's "Dock Walls," 6s. (E. & F. N. Spon, Ltd.). Thomas Stevenson's "Design and Construction of Harbours."

Engineering and Owen's College, Manchester.

HASLINGDEN.—H. M. M. writes: "I enclose a prospectus of the department of engineering at Owen's College, Manchester. My son, being over seventeen years of age, intends to enter for the preliminary examination. The cost of the course is about £30. Do you approve of it?"

Owen's College, Manchester, provides a most admirable course in engineering, but there is nothing to modify our former recommendation. Only by becoming articled to an engineer can your son get a practice and set up in business as an engineer. Technical colleges are useful for imparting a knowledge of theory, but practical knowledge can only be obtained by experience on works and in shops under a capable civil engineer. We may refer you to Mr. Mansergh's address on this subject published on p. 238 of our issue for May 1st last.

"Carbolineum Avenarius."

LONDON, S.W.—A. G. H. writes: "Where can 'carbolineum avenarius,' a material for preserving wood, be obtained?"

Messrs. Peters, Bartsch & Co., of Derby, and 68, Queen Street, Cheapside, E.C., are the makers.

New Patents.

These patents are open to opposition until December 9th.

1900.—Sewage Filtration.—19,264. D. CAMERON, 1, Sylvan Road, Pennsylvania; F. J. COMMIN, 7, Bedford Circus; and A. J. MARTIN, Bradninch House: all of Exeter. One part of this invention relates to an improved grit chamber so constructed that floating solids in the sewage are carried away and not allowed to accumulate on the surface. This is accomplished by providing the chamber with vertical or inclined guide-boards, either fixed or movable. Another part of the invention relates to the distribution of the sewage over the bed, this being effected by several funnels carried by vertical shafts built up from the floor. It is claimed that, being thus rigidly supported, the distributors will not get out of level.

Urinals.—21,692. J. DUCKETT & SON, LTD., Sanitary Ware Works, and J. W. BULLOCK, 30, Accrington Road; both of Burnley. A removable cover strip is provided over the joint between the caps, the flushing pipe fitting it at the top. The flushing rim is preferably made of earthenware and is formed in a loose piece to fix on top of the curved back. In this way copper sparge pipes are dispensed with, cheapening the cost of the urinal.

Street-Paving.—22,105. A. C. W. HOBMAN, 110, Queen's Road, Peckham, S.E. The object of this invention is to produce a paving which, while possessing the qualities of asphalt, is non-slipping and durable. Granite, Kentish rag, or other suitable stone is broken to pass through a 2in. ring. The pieces are thoroughly dried, and are then coated with a waterproof substance like mineral oil, Trinidad pitch or tar. After a good foundation has been prepared, the stone is mixed with a flux, laid, rolled and grouted.

1901.—Lifting Jacks.—3,629. E. R. FARNSWORTH, Bank House, Bank, Matlock. The jack has a central screw operated by a worm-wheel which is mounted on ball bearings, thus facilitating its use.

Forming Dovetails.—9,262. P. HANSEL, 250, Bahrenfelderstrasse, Ottensen, near Hamburg. The machine is fitted with two pairs of knife heads adapted to form mortises and tenons simultaneously in two boards.

Artificial Stone.—15,214. E. KREFT, Hartsteinfabrik, Münster, Westphalia, Germany. The "digester" made according to this invention, in which the moulded stones are submitted to the action of steam under pressure, consists of a boiler fitted with a rail on which the wagons carrying the stones are suspended. In this way the risk of damage is largely reduced, and the steaming is more economically effected.

Water-closet Seats.—17,760. W. E. MASON and G. MUSGRAVE, both of the Pearl Brook Sanitary Works, Horwich, Lancs. The seat is formed integral with the pan and of the same material—fictile ware. A throating is formed in it to receive a hot-water or steam pipe for heating the seat, which, while being thus made comfortable, can be thoroughly cleansed.

The following specifications were published on Saturday last, and are open to opposition until December 16th. The names in italics are those of communicators of inventions. A summary of the more important of them will be given next week.

1900.—16,724, RAWLINSON, setting devices for mortising machines. 18,308, MACFARLANE, rotary kilns. 18,579, STEWART, files. 18,892, WRIGHT & DARWIN, fixing gas fires in open grates. 19,566, MCINROY, hoist-door fittings. 19,706, ALLEN, ALLEN, FORD & ALDRED, ventilating baths, sinks and lavatory basins. 20,132, HOPKINSON, LOWIS & J. HOPKINSON & CO., LTD., valves. 20,679, HIPKINS, coin-freed locks for doors. 21,275, TAYLOR, sash-fasteners. 21,696, JONES, opening and closing fanlights, casements, &c. 22,074, TYMM & SLACK, knife for brickmaking machines. 22,119, WRIGHT, windows. 22,155, JOHN MCGLOUGHLIN & CHARLES MCGLOUGHLIN, LTD., opening and closing window-sashes and ventilators. 22,228, HUTCHINGS, clip for fixing roofing slates. 22,470, BEREND (*Schauer*), incandescent gas mantles. 22,730, LESTER, astragals for roof lights and windows.

1901.—737, LACEY & REES, portable pump. 2,870, THOM, parallel rulers. 10,183, BUSCH, acetylene gas generators. 13,794, FLECHTHEIM, street-sweeping machines. 16,293, BURGUM, flushing apparatus. 16,465, ZUPPINGER, door locks and latches. 17,161, JUSTICE (*Mississippi Glass Co.*), machines for rolling configured wire glass. 17,560, BOULT (*Druitt*), pulverising or crushing machines. 17,566, BELIN, apparatus for generating acetylene. 18,008, HÖYER-ELLEFSEN, fireproof floors. 18,031, KINNEAR, fire-resisting doors, blinds, &c.

Keystones.

A New Central Library at Bournemouth has been erected at 2, Stanhope Gardens, facing the Horse Shoe Common.

New Synagogue at South Shields.—At a meeting of the Hebrew congregation at South Shields Mr. Henry Grieves, of that town, was elected architect for the proposed new synagogue.

A New Board School has been erected for the London School Board in Clancarty Road, Wandsworth Bridge Road. It has cost over £28,900 (exclusive of site), and contains accommodation for 414 boys, 414 girls and 416 infants.

Monument to Chopin.—The Russian Government has sanctioned the erection of a monument at Warsaw to the celebrated Polish composer, Frederick Chopin. The initiators of the projected monument intend inviting designs for the work from British and foreign sculptors.

An Indian Competition.—We hear through Mr. A. H. Ryan-Tenison, A.R.I.B.A., that his late colleague, Mr. Edward Thornton, A.R.I.B.A., has won the first premium for the New General Post Office, Lahore, India. There were thirty-two competitors. It will be remembered that Mr. Edward Thornton left England to take up the appointment of head of the Architectural Department of Sir Ackwin Martin & Co.'s firm, Calcutta.

A New Building at the Dundee Royal Asylum is being erected at West Green. The building has been designed by Mr. T. S. Robinson, architect, of Dundee, and has accommodation for about sixty patients. The style of the building is Scottish Baronial, of red stone from Ayrshire for the dressings, while local quarries have supplied the rubble. The centre part containing the principal entrance is of one storey, and the wings to the front three storeys, while to the back the wings are only two storeys. The cost has been over £22,000. The contractors were: Mason, Mr. William Bennett; joiners, Messrs. D. P. How & Son; plumber, Mr. David Brown: plasterer, Mr. James Laburn; slater, Mr. A. Buttar, jun.; glaziers, Messrs. Lindsay & Scott; bells and blinds, Messrs. J. Pullar & Co.; heating, &c., Messrs. G. H. Nichol & Co.; firecocks and water pipes, Messrs. P. Nucator & Son; roads, Mr. Peter Girrity; carving, Mr. James Bremner; painters, Messrs. Petrie & Greig; drains, Mr. Peter Bain; electric lighting, Messrs. J. Muckersie & Co.; clerk of works, Mr. James Robertson.

Baptist Church, Lewin Road, Streatham, S.W.—The existing school chapel has had to be incorporated in the new design for the church, and has been utilized as transepts to the new building and new nave being erected with two-light tracery-headed windows and buttresses, and a bold square tower and spire, with angle pinnacles and a metal corona and finial. The main doorway is in the base of the tower. The roof is of open-timber principal trusses, with boarded ceiling varnished. The seating is semicircular in plan. The choir is on the daïs in front of the pulpit, with a baptistery lined with tiles and marble steps on the daïs. The organ gallery is in an apse behind the pulpit, with two vestries under. A large vestry is formed behind the present school, with a heating-chamber under. Provision is made for a future gallery at the end of the nave. The building is to be faced with red bricks with white Costessey dressings. The roof is to be of green slates. The contract without seating is £3,033. Messrs. George Baines, F.R.I.B.A., and Reginald Palmer Baines, of 5, Clement's Inn, Strand, W.C., are the architects.

Emmanuel Church, Cambridge Road, Southport, has been completed by the addition of a tower and peal of bells at a cost of £4,000. The total cost of the edifice was about £30,000.

New Cottages, Homes and Schools are being erected for the children of the Medway Union at Chatham, at a cost of between £25,000 and £30,000.

The Chancel of Egerton Parish Church has been restored. A new altar dossal has been added, together with an altar cross. The carved oak of the choir stalls has been well cleaned.

In Connection with the Alterations at Windsor his Majesty the King has given an order to a Derbyshire firm for eight marble pedestals 4½ft. in height, with Gothic panels. One of the pedestals is to bear a bust of Queen Victoria. The order is to be executed at an early date.

A New Sunday School has been erected at the rear of St. George's Road Chapel, Hull. Messrs. Gelder & Kitchen were the architects, and Messrs. Hebblewhite & Wilson were the contractors. The cost of the building is £5,200. The large hall accommodates 300, the infant school 200, young men's room 70, young women's room 150, and the church parlour 150.

A Freemasons' Hall at Oswestry is being erected at the junction of Roft Street and Market Street. Brother W. H. Spaull, F.R.I.B.A., is the architect. The building will consist of a hall and a dining-room which can be thrown into the hall when required, with retiring-rooms and other conveniences. On the first floor there will be a large room, to be used for Masonic purposes only, and a tyler's room. A caretaker's house will also be attached. The building will be faced with red bricks and buff terra-cotta dressings. The cost is estimated at about £2,000. Messrs. Griffiths & Sons, of Ellesmere, are the contractors.

The New Hall for Barry Parish Church has just been completed from the plans of Mr. James P. Bruce, architect, of Carnoustie, and is situated on the site of the parochial school. The design is Gothic, freely treated, and can accommodate 200 persons, and there is also an ante-room and other conveniences. The contractors were: mason work, Mr. George Robertson; joiner work, Mr. George Fox; plumber work, Mr. John M'Andrew; slater work, Mr. Alexander Hogg; lath work, Mr. James Fyffe; plaster work, Messrs. M'Ritchie & Co.; smith work, Mr. Robert Crighton; ventilation, Messrs. Robert Boyle & Son, Ltd.; heating, Mr. William Nicoll; glazing, Messrs. Donald & Smith; painting, Messrs. P. & A. Davie.

A New Church at Roath, near Cardiff, capable of seating nearly 1,000 persons, has been erected as a memorial to the late Bishop Smythies, of Zanzibar. It is of red bricks with stone dressings. The site was a very awkward one, and thus the nave of four wide bays is flanked by a narrow processional aisle on the north side and a very wide aisle on the south. There is no chancel arch, the main roof being unbroken from end to end, and the chancel is of the same width as the nave. There is a side chapel north of the chancel, and the south aisle is terminated at the west by a baptistery. When funds permit a lofty stone rood-screen will stretch across the entrance to the chancel, with ambons north and south for use as pulpit and lectern. The church has cost over £10,000.

Liverpool Cathedral Fund Hanging Fire.—There can be no doubt, says the "Liverpool Review," that the scheme is hanging fire. In some six months nearly half as much as the sum with which Truro began—little Truro, with less than one-twentieth of our city's population, not to speak of the population of the diocese—has been collected. Roughly, one hundred thousand and a half has been subscribed, enough to buy a decent site, no more. The late bishop used to say that he would not like to think of beginning with less than a quarter of a million. He was right. That was Truro's amount. Even so, Truro has not completed its cathedral! And yet some of us have been foolish enough to think that we can get the site, build the fabric, complete the endowment, all for the sum with which Truro built its nave, all for the sum that has already been spent on the Westminster Roman Catholic Cathedral. Bolder ideas were needed or they would never get bolder, bigger generosity.

The Royal Society of British Artists has decided to limit both of its shows to the works of the members. Hitherto the spring exhibition was open to "outsiders."

The Furniture in "The Last of the Dandies," Mr. Beerbohm Tree's new production at Her Majesty's Theatre, was supplied by Messrs. Oetzmann & Co., of 63-79, Hampstead Road, N.W.

A New Church for Plumstead, to be called St. Mark's, is being erected in Old Mill Road, Plumstead. The buildings will include schools, rectory and club-rooms, and will cost over £15,000.

Bridlington Priory Church.—A peal of eight bells have been presented to the Priory Church at Bridlington, which are to be used for the first time at the coronation of the King.

A New Public Hall and Library at Abergwynfi has been opened. The building cost £2,800, and the public hall is capable of seating 800 to 1,000 persons.

A New Church at Boosbeck, near Saltburn, has just been erected. The contract price for the erection of the church was £3,150, and in addition to this the furnishing has cost £600.

A Three-light Memorial Window to the memory of the late Lieutenant Robert Walter Maxwell Brine, his elder brother, Frederic Bruce Brine, and his sister, Henrietta Ina Lindesay, was unveiled at the parish church of Bishop's Waltham, Hants, recently. The window was executed by Messrs. Lavers & Westlake.

A New Nave in Awsworth Parish Church is being erected of red sandstone bricks, with dressings of Coxbench stone. The seating accommodation will be for 600 persons. The eastern portion of the old nave is being retained, and will be adapted as the chancel of the new church. The architects are Messrs. Naylor & Sale, of Derby, and the general contractors Messrs. Walker & Slater, of Derby.

New Public Baths for Bradford.—Plans were recently approved by the Bradford City Council for the construction of an open-air swimming bath and gymnasium at the south-east side of Harold Park. The estimated cost is £1,100. New public baths are also in contemplation for Morley Street and Drummond Road, Bradford, the cost being estimated at £41,000 at the former place and £10,000 at the latter.

The Argyll Memorial.—A cross has been erected by the Dowager Duchess of Argyll to the memory of her husband, the late Duke of Argyll. The cross stands 21ft. in height, and is of fine red stone. It has been placed on a high cliff called Dun Dubh, which overlooks the Atlantic Ocean and is situated at Macharinoch, Kintyre, Argyllshire, about twelve miles from the Mull of Kintyre. The cross is massive and simple in form. The pedestal is square, and bears an inscription on each of the four sides.

Marlston Church, Berkshire, which was built by Sir Geoffrey Martel originally in the Norman style of architecture, and forms part of the parish of Bucklebury, Berks, has been considerably restored, enlarged and decorated. For several years past the fabric of the old church showed signs of weakness, and the architect reported that it would be necessary to underpin the whole building. It was accordingly resolved to effect a complete restoration of the church and also to build a new chancel and vestry.

A New Steeple to the Parish Church of Foot's Cray, Kent, has just been added. As long ago as 1700 the steeple of the church was condemned as unsafe, but it was still standing when the present rector entered upon his charge in 1861. It was then stayed and strengthened, and so made to serve for another forty years. But within the past few months the condition of the structure had become so dangerous that it was found absolutely necessary to demolish it and erect a new one. The work of construction was entrusted to Messrs. Stebbings & Pannett, of Foot's Cray and Sidcup, and they have carried out the designs of Mr. Boucher, of the firm of Drake & Boucher, architects, Rochester, reproducing exactly the old Kentish timber and shingle style of steeple which has been associated with the church for hundreds of years. Advantage was also taken of the occasion to have the peal of five bells retuned by Messrs. Gillett & Johnson, of Croydon, and rehung in the steeple. The work has cost altogether £600.

Views & Reviews.

How—and How Not—to Build a House.

This book is a collection of eight lectures—three of them by Mr. Parker, three by Mr. Unwin, and the remaining two written conjointly. The chief theme is the degradation of art and architecture to day, with suggestions for their improvement. We are urged to abandon the conventionalities which force on us things which we do not require, to put aside those fripperies and fineries which display themselves in most homes, to adopt a plainer yet more truthful system of design and decoration. "Let us have such ornament as we do have really beautiful and wrought by hand . . . let us call in the artist, bid him leave his easel pictures, and paint on our walls and over the chimney-corner landscapes and scenes which shall bring light and life into the room. . . . Then, if necessary, let the rest of the walls go untouched, in all the rich variety of colour and tone, of light and shade, of the naked brickwork. Let the floor go uncarpeted, and the wood unpainted, that we may have time to think. . . ." Now this, in the introduction, gives us a key to the authors' ideas of reform, but they appeal almost to our sense of humour rather than stir our very being against the enormities of the modern house. Everyone with the slightest artistic feeling must deplore the taste which fills our drawing-rooms with a thousand and one petty ornaments, the floor bespattered with occasional tables which hardly seem to justify even such a limited demand on their services as their name implies (as Mr. Baillie Scott once put it); the taste which covers the walls with "His Majesty the Baby" and similar trash; or which insists on everything being carved and stamped and scratched with the notion of redeeming it from a hated plainness. We are alive to the need for reform, but what is the use of attempting the extreme and the visionary as set forth in the passages quoted above? You are appealing to the householder, and he will never improve if you insist that he is to live between naked brick walls and on uncarpeted floors. In reading through this book, however, we are glad to find that Mr. Parker, at least when alone, has something better to say; in fact, he says a great deal which is most commendable. He has the Ruskin dislike of anything machine-made. If it is a piece of copper, he wants it with the marks of the hammer by which it was wrought, and not "lost in mere smoothness and mechanical finish"; if it is window glass, he wants it leaded and not plate. In the lecture on "Our Education in Art" he touches on a vital matter, that of the training of an architect. According to his system the student would first acquire a comprehensive knowledge of pure building construction, but no architecture—"in so far as it can be separated from building construction. . . . The course of study laid down by the Institute of British Architects for its pupils commences with 'Evidences of Study' of old Greek and Gothic buildings; in all cases suggestion is substituted for development, and in consequence we have turned out by the thousand men capable of reproducing works in all styles, but with no vital appreciation of the spirit and causes which lead to the existence of any one of them, and not one who can evolve a really vital work of art among them." The Institute, it is true, has a lot of blame laid at its door, but we do not think that Mr. Parker has proved his system to be any better, judging by the examples in this book. It is easy enough to talk about imperfections, but less easy to correct them; it is simple to speak of catching and portraying "the words and messages of Nature, and the poetry of the whole," and to discourse on the relative values of shadows in a landscape, but the force of the remarks is lost when reference is made to such specimens of draughtsmanship as those presented in this book; in fact, it would have benefited the letterpress greatly if many of the plates of drawings and designs had been left out: one would not then have set up a comparison. It is impossible now to refer to many other matters dealt with under the headings of "Art and Simplicity," "Furniture," "Building and Natural Beauty" or "Co-operation in Building." The tenor of the remarks will doubtless be gathered from what has already been said. There is much which is good, and much which is otherwise (mostly from the pen of Mr. Unwin); and if it had not been for some of the samples of work shown among the sixty-eight plates we should have considered the work thoroughly commendable.

"The Art of Building a Home." By Barry Parker and, Raymond Unwin. London: Longmans, Green & Co. 39, Paternoster Row; price 10s. 6d. nett.

Mitchell's Advanced Building Construction.

The architectural profession has not yet been supplied with a really good and comprehensive work on building construction. Several attempts have been made to meet the want, but not one has thoroughly succeeded. Rivington's "Notes on Building Construction" was a worthy attempt to cope with the difficulty, and it remains the standard work, but one could not expect that this would be anything more than a fairly good book of recipes, mostly rule-of-thumb and gathered from various sources, and dealing also in an elementary manner with principles, the knowledge being now somewhat out of date. Such a large encyclopædic work as is required could only be expected from many specialists, who would have to carry out large and prolonged series of experiments. Of course, the chief reason for the incomplete and rudimentary knowledge of building materials and methods is the immense field covered, and only in few branches which are particular trades has full study been carried out, such as in pottery, iron and steel. But nevertheless there is an immense amount of information of real value that has been published of recent years in diffuse form, and from this it should be possible to prepare a book that would suggestively and elastically deal with the principles of building construction, just as Rankine has dealt with engineering and Unwin with machine design; and there is, therefore, no adequate excuse for such a book as Mitchell's "Advanced Course." The "First Stage or Elementary Course" suffered somewhat from the same want of grasp and clear treatment of principles, but its demerits were excusable as a cheap guide to the elementary South Kensington examinations, which, at the time it was published, merely required a number of facts, usually crammed by the student. With the advanced course, however, though intended as a text-book for these examinations, the two parts attempt to give full instruction in building construction. It is sad to think that many students taking the book at its own valuation will go through life with the notion that the course they have been taken through accurately represents the real and most advanced methods of building. Of course it may be contended that considerable investigation of every part of a subject need not be made, as what is already known is sufficient for all purposes; but the advances made in other trades, just as presumably unimprovable, disprove this passive attitude.

A book on building construction should deal clearly with the principles of the various sciences connected with building, so far as they relate to it, in an interesting manner, and should then proceed to elaborate the particular methods, materials and appliances at present in general use, treating them in a way that will not weary the brain; and in addition it should suggest methods of improvement, teaching the student to think for himself. Thus, the book should start with an introductory chapter dealing with the subject from an ethical standpoint, showing the union of the various branches of science of which it is compounded. If the author knew his subject well his inner thoughts on matters would add an interest and incentive to study that would carry the student over dry roads in other parts. Then the book should, we think, proceed to separate chapters giving the elements of chemistry, botany, geology, mechanics, metallurgy, &c., summing up all the points needed for the course and giving particulars of where to obtain further information. Graphic statics should come to the front of the book (and not be sandwiched in the middle as in Mitchell's "Building Construction"). It might also be possible to deal with mathematics in a short manner sufficient for its purpose. Then the book could proceed to particularize and apply these principles. At present we find in Mitchell's book statements and explanations arising without previous explanation and assuming a knowledge more advanced than is assumed in other portions; thus on p. 20 a formula for calculating the transverse strengths of concrete beams is given, but it is not shown how it has been determined; and again on pp. 166, 167, 176, 177, 178 and 180, the explanation of the derivation of the formulæ is not clear enough for the student. The same occurs in the chapters on brickwork, pillars and girders. The want of systematic treatment is apparent on p. 291, where to calculate the dimensions of shores reference has to be made to the chapter on pillars which follows.

In this third edition the text has undergone revision and amplification, and no fewer than 334 figures, including several double-page plates, have been added. Many of the by-laws of the Local Government Board and London County Council have wisely been included in the book, and in most trades a typical specification approved by some important public body has been inserted. This latter is a good feature. The chapter on sanitation has been revised by Mr. J. Wright Clarke, and is on the whole satisfactory.

We shall now mention a few errors and omissions; the latter need not be excused on the score that the book is already very large for the price, for most of it could be condensed with advantage, and if the system of putting an italic side-head to each paragraph were abandoned, except in the most important cases, and many of the paragraphs combined, it would economise space and enable the matter to be read more easily; as an instance we may refer to p. 73.

In the chapter on materials the chemical formulæ should be either abandoned, or extended and revised, with the addition of equations showing the chemical action of materials. If it were assumed that the student should know elementary chemistry, then the matter in the book is not needed, as it will be of no use to him, for he will already know it. Moreover, many of the formulæ are out of date and wrong. The wording of the descriptions is often most ambiguous. It is absurd to refer to the "impurities" in hydraulic limes (p. 2) when such "impurities" give these limes their value. Then again in reference to chalk, it is misleading to say it is unable to combine in this form with other materials; this should be deleted or an explanation given of what is meant. Then the term "violence" (p. 3) in reference to the separation of carbon dioxide from limestone in the making of lime is too strong an expression. The explanation of slaking is beside the mark: it should be stated that lime will not combine with carbon dioxide when no water is present. It should be clearly stated that fat and poor limes are not suitable for mortar, and that only hydraulic limes should be used. To speak of "the soluble lime in a saturated solution" (p. 4) is a misuse of terms. The explanation of the setting of limes (p. 5) is an assumption unwarranted by facts. The chemical formula for hydraulic limes and cements (p. 6) is wrong on the face of it. It is usual also to divide the parts of a formula with a full stop—thus $CaSO.2H_2O$, not $CaSO_4, 2H_2O$. It is not apparent what the analysis of gypsum on p. 7 refers to, weight or volume. If the former it is wrong, and moreover its nomenclature is old and has now been abandoned. The rough tests given for Portland cement are inconclusive, and a better method is given on p. 245 of our issue for May 1st last. The setting of cements might well be explained. Instead of saying that the shrinkage of the materials of concrete when mixed with water is about ·15 of the total bulk, why not say $\frac{1}{7}$, or on p. 173 why not $3\frac{1}{3}$ for "nearly 3·33 times"? The tests given on pp. 19, 20 and 21 are too vague and old to be of much value. Asphalt (p. 22 and following) is spelt without a final *e*. The analysis of bitumen (p. 23) could be omitted without loss. Earth is not kept "sweet and dry" after being covered with asphalt. It should be stated that hot rammers are used to compress the powdered asphalt. The statement as to the values of artificial and natural asphalts (p. 25) is out of place. The definition of plastering (p. 26) is somewhat crude, as are the definitions throughout the book generally. Sills are not only "often" but *generally* moulded before fixing (p. 30). It is somewhat amusing to find in a text-book the colloquial and slang terms used by London plasterers (p. 31). Iron nails

(p. 33) should not be stated as "oxidizing" in plastering; "rusting" is the word, as rust is not an oxide of iron only. Wire "lathing" should be substituted for the word "netting" (p. 34), as the latter suggests particular patent kinds. Fuller explanation should be given (p. 37) of the reason for washing sand. Considering that pit-sand generally was once water-worn, it is often no sharper than river- or sea-sands, and for roads and rough work the latter, being cleaner, are the best. On p. 38 reference should be made to shingled surfaces. On p. 45 the reference to the oscillations of the earth's surface needs explanation; also as the composition of silicic acid (and on p. 53) is very uncertain, being most unstable, the formulæ given should be omitted. The silicates are usually taken to be compounds of silicia with basic radicles. On p. 46 the word "impurities" is again misused. A definition of oolites is needed on p. 46. In defining the second cause of rock-formation "or" is printed for "and." Sulphuretted hydrogen (p. 47) is not an acid; sulphurous and sulphuric acids are here meant. The acids furthermore are not present in large enough quantities to "dissolve" the constituents of stones; they merely combine to form compounds soluble in water. The methods of testing stones for porosity should be more fully explained. The reference (p. 48) to the weight of a stone indicating its porosity needs modification. Quarry sap is not "moisture." The *purpose* for which a stone is used does not *determine* the position of the bed (p. 49). Silicic acid may have been the means of cementing the grains in sandstones (p. 51), but it does not remain in this form, and more often the cementation is due to silicates. The formula for felspar is not according to current practice, and is wrongly printed, as also are those for mica, hornblende and augite. There is a typographical error in the formula of carbonate of magnesia on p. 53, and another error in the paragraph relating to alumina on p. 54. The formula for kaolin is not in current notation, nor is it correct. The chemical tests for stone given on p. 54 are inconclusive as to weathering, for we have found Portland-cement concrete and red Corsehill stone effervesce and powder under sulphuric and hydrochloric acids, and there can be no doubt as to their weathering qualities. The reasons of disintegration of stones, and the way they weather, are not dealt with in the book. The specific gravities of stones are calculated into too many places of decimals, as stones vary very materially from the same quarry. It is not stated where these particulars were obtained from, and whether they are the average specific gravities found from a large number of tests, as they should be. The particulars of various stones are also too meagre, and almost useless in practice. Red Mansfield (p. 62) is given as "very durable," whereas bleached and crumbling specimens are to be seen on every hand in London; Corsehill is dismissed with the words "good weathering stone," but it is far more durable than Red Mansfield, being composed of 90 per cent. of silica. The "oxide" of iron in unburnt clay, referred to on p. 72, is a hydrated oxide of hydroxide or iron, the correct names of the "hydrous" oxides referred to on p. 74. On pp. 75 and 76 special makes of bricks and glass-tiles are mentioned, needlessly giving the firms who make them an advertisement, which is unfair to others making similar bricks, &c., and the same thing occurs in other places. The tests of brick piers and the tensile strength of bricks, given on p. 80, are given without sizes, which is most necessary to make them of any value. On p. 83 the method of preventing finely-wrought terra-cotta decorations and figures warping in the burning by adding sawdust to the clay should be noticed. Sodium chloride, on p. 84, is a high sounding name to use for common salt, and is but an instance of the way the authors go out of their way to make the book appear learned; also far too often one name for a material is given when several are in common use, such as in the names of the iron ores on p. 85. The section on iron and steel is, moreever, very incomplete and misleading, and we advise all students to read up the subject in recent works on engineering. The "Double" and "Triple" Best Iron (p. 89) is usually known as Best Best Iron and Best Best Best Iron. The crystalline properties of iron and their effect on its strength are not sufficiently dealt with, but it is needless to elaborate the defects of the section. Pitch-pine (p. 119) is praised for its "beautiful" appearance, whereas the concensus of cultured opinion is that its hot colour is distressing for interior work. The oxide of iron (p. 129) is known as "black" oxide, and if the author doubts its efficacy for painting iron by stating it as "supposed," why does he not investigate the subject and disprove or prove it? The formula for acetate of lead (p. 131) is wrong. The allusions to Classic and Gothic styles on p. 184 should be deleted, as the "styles" are outside the province of the book. A recurring decimal is misprinted on p. 210. There is a purely graphic method of calculating the dimensions of retaining walls which should be given; the method on p. 216 is at present obscure. The aim (p. 296) of half-timbered construction is stated to be to obtain a picturesque effect, but the element of cheapness where timber is plentiful should be considered.

THE MUNICIPAL ORPHANAGE, MUNICH. HANS GRÄSSEL, MUNICIPAL ARCHITECT.

The illustration on p. 193 of a damp-proof course in a hollow wall does not show the best method, which is given on p. 140 of our issue for March 27th, 1901. Throughout the book sizes of materials are given for particular purposes without an explanation of the reasons. The foregoing are perhaps the most flagrant instances of errors and omissions which are likely to seriously mislead the student, but there are many more we have not space to deal with; however, from what we have said it will be seen that the book needs considerable revision to be of much value as a text-book of the principles of construction. We can, however, compliment Mr. Batsford, the publisher, on the admirable manner in which he has performed his part of the production, the illustrations being well reproduced and printing and type clear and paper good, at a low price.

"Building Construction: Advanced and Honours Courses." By Charles F. Mitchell, assisted by George A. Mitchell. Third edition, revised and enlarged. London: B. T. Batsford, 94, High Holborn, W.C.; price 5s. 6d.

Correspondence.

Proposed Memorial to the late Mr. James Brooks.

To the Editor of THE BUILDERS' JOURNAL.

ST. FAITH'S VICARAGE, STOKE NEWINGTON, N.

SIR,—From several quarters it has been brought to my notice that a feeling exists that steps should be taken to raise some memorial to the late Mr. James Brooks, F.R.I.B.A.—this on account of the work he has done for the Church at large in many localities. I am led to write this on account of what he did for St. Faith's, a church designed by the late Mr. Burgess, at whose death Mr. Brooks completed, on his own responsibility, its western portion, and under his immediate care, or that of his son, Mr. Martin Brooks, carried out many additions and improvements, *e.g.*, vestries, porch, &c.; at the time of his death he was erecting the Lady Chapel. For the last twelve years, with one single intermission, he acted as churchwarden of St. Faith's, and for the last six continuously as vicar's warden. It seems therefore natural that the memorial should be erected in St. Faith's. Various objects have been mentioned, such as a chancel screen, west window to be filled with stained glass, screen between the church and the chapel, also an institute with caretaker's house. I should be glad to have the views of your readers on the subject, but I feel the selection of the object must depend very much on the amount of subscriptions received, and, secondly, on the wishes of Mr. Brooks's own family. Subscriptions may be sent either to Mr. W. Jenkinson, 147, Albion Road, the parish warden, or to myself.—Yours truly, C. H. V. PIXELL.

R. I. B. A.

PRESIDENTIAL ADDRESS.

THE first general meeting of the session 1901-2 was held last Monday evening. The minutes of the previous meeting having been confirmed, Mr. Alexander Graham, hon. secretary, referred to the deaths of Messrs. W. Larner Sugden, Robert I. Bennett, Yeoville Thomason, Herbert Richard Lloyd, John Mackland, John Littlewood and James Brooks. He announced that Mr. Emerson, the president, had been elected a honorary member of the American Institute of Architects. He then moved a vote of thanks to Mrs. Cates for the very kind way in which she had carried out the bequests of her late husband to the Institute. This was seconded by Mr. R. Phené Spiers, and carried by acclamation. On the motion of Mr. John Slater votes of thanks were accorded to the various bodies and societies of Glasgow for the kindness displayed to members of the Institute at the recent general meeting held in that city.

Mr. W. J. Locke, the secretary, announced that Mr. Clement Osman Nelson had passed the examination qualifying him to act as district surveyor under the London Building Act, and that Mr. Andrew Montague Sharp, of Montreal, Canada, had passed the Colonial examination qualifying as associate.

Mr. William Emerson then delivered his presidential address. He said :—

Our numbers maintain a steady increase; we have about 1,700 actual members—or over 3,000 members, counting those of societies in alliance with us. There are also some 1,500 probationers and more than 400 students.

The widening of Piccadilly was stated to be only a part of a large improvement scheme for that particular approach to the City from Kensington in which the taking down and rebuilding of Walsingham House would afford an opportunity for a move in that direction. Whether this is so I have no knowledge; but the question I would ask is, why deal with only one small portion of London at a time? The whole question of the rebuilding of London, enormously difficult as it may be or the huge expense it may involve, ought now without further delay to be considered. Definite improvements and building lines should be laid down in all important directions, and all buildings pulled down and rebuilt or altered in the future should be obliged to conform to the scheme.

A great deal has been written of late in some of the journals on the subject of assessorships in competitions, and evidently without knowledge of the truth of the matter or troubling to ascertain it. The suggestion has been that the blame of the dissatisfaction so constantly arising as to awards lies at the door of the president or Council of the Institute for not having exercised sufficient care in the selection of assessors. I have therefore had a list made of the competitions held since July, 1899, up to September last, with the assessors' names and the results, and I find there have been ninety-seven competitions held in all parts of the country. Out of this number there were seventy-three in which the authorities chose their own assessors, or, at any rate, did not apply to the Institute to name one. Out of these seventy-three the assessors' awards were set aside, and dissatisfaction was expressed in twelve cases, or, practically, one in every six competitions. In the remaining twenty-four the president of the Royal Institute of British Architects, or the Council in a few instances, nominated the assessors, and in not a single instance was the award of these assessors set aside, nor can I find that any expression of dissatisfaction arose at their awards. I think this proves how ready some even of our own members are to blame either the management or the officials of the Institute when they do not even know the facts about which they are writing or talking. A little more loyalty and real honest endeavour to serve the ends for which we are all supposed to be united and working would be more to the point and assist materially the work of the Institute for the good of our art and the profession at large.

This examination of the result of the enormous number of competitions in a couple of years only is enough, I should think, to deter most men in the profession from taking part in them; but if not—and if we choose to have it so—we should bear in mind that in every competition the larger proportion of the competitors must naturally feel disappointed, as there can only be one winner; and if a man does not care to take this risk he should not compete. If the public continue to lay the burden of competition on the profession, and we prefer to bear this burden of enforced gambling, then at least let us be fair amongst ourselves and insist that nothing shall upset the principle we have long ago laid down—that when a duly qualified assessor has been appointed and has selected a particular design the author of that design shall, unless there be some very special reason to the contrary, be employed to carry out the work. Otherwise we are simply playing into the hands of an unscrupulous public, prepared to take every advantage of our time, talents and money. Even should the assessor happen to make an award that does not commend itself to all, it will certainly be better for the profession in the long run that the award be upheld than that each dissatisfied competitor should endeavour to upset it. Our only safeguard is loyally to uphold this principle.

I wish to suggest an alteration in our accustomed church or cathedral arrangements, with a view possibly to induce at some later date a discussion on the point of bringing altars forward, nearer to the congregations, than is possible with the present arrangement of deep chancels and choirs. In 1884 I wrote in one of the building journals some thoughts on church-planning, the object of which was to show that the common fourteenth-century plan, with the crossing blocked by large piers and the enclosed choirs in the centre of the church, though well adapted for the mediæval and monastic times, is quite unsuited to modern worship in the nineteenth century. This view now seems generally accepted; but further than this, the fervent spirit that has developed itself under the Church revival of late years renders it necessary that the large congregations should be able both to hear and see all parts of the services for full participation in them. What is wanted now is a large open space for worshippers, with the altar brought well forward, and not buried in the depths of a lengthy chancel or choir, as in the case of the fourteenth-century English cathedrals, of which type the new one at Truro is a modern representative, and, however good in its architecture, is simply an anachronism. Tradition and conservatism are well in their way, but should not go to the length of hampering modern requirements with obsolete arrangements made for the benefit of colleges of monks and not for the people. The desirability of a good open space for congregational purposes is now by most thoughtful minds generally conceded. The point I would suggest for reflection is the possibility and propriety of a further advance in increasing the facilities of large congregations for seeing and hearing, and participation in those parts of the services conducted at the altar, by an alteration in its position, which might, while being a step in advance towards meeting modern congregational wants, possibly also be found to be in a measure almost a return to early usage.

The question I ask is, conceded the open space in the centre of a large church, why should we not consider the advisability in the future of altering the arrangement of our choirs and placing the altar at the entrance to the choir instead of at the east end, with the clergy choir and bishop's throne behind the altar?

The seats for the clergy being situated behind the altar is a far older arrangement than the position assigned to them in the mediæval and monastic times. It existed at first in some of our own early cathedrals, as you all know—at Norwich and Canterbury, for instance. I believe I am right in stating that the view of the Anglican party in the Church is that their rules, doctrines and worship are intended to be in accordance with those of the earlier Church, and go back to the time before the Bishops of Rome established the Roman Church as the chief of all the churches and arrogated to themselves the position of supreme head as Pope or Father. Now at this early period it is certain that the arrangements in the Christian churches provided for the altar being immediately in front of the congregation, and the seats for those who officiated at the various offices and at the altar behind it. In the early basilican arrangement it was evidently thought desirable that no great distance should intervene between the congregation and the altar, and for this reason no doubt it was placed in front of the Bema, thus bringing it in close proximity to the worshippers. In those days the form of worship was comparatively simple, and the officiating clergy, who probably acted as cantores also, were seated behind the altar, their seats being ranged around the Bema, with the bishop's throne in the centre, and the worshippers evidently took full part as well as the clergy in the ceremony of Divine worship.

Some few centuries later, when, in consequence of the holy mystery of the Divine Sacrifice being more prominently suggested in the church arrangements, indicated by the veiled altars, the ritual had extended and comprised more ceremonial, and more attention was paid to music, the addition of a chorus cantorum or choir was made, intervening between the altar and the congregation and jutting into the nave. The clergy still occupied the same position behind the altar during the missa and officium divinum, but subsequently those in holy orders, as well as the cantores, occupied the lower portion of the choir during the officium divinum, and those only actively engaged in the missa occupied the Bema.

One evident reason of the choir being thus brought forward into the nave between the altar and the congregation in the basilican churches, as in the upper church of San Clemente and others, seems likely to have been that had the increased number of singers been placed, like the priests, behind the altar, it would have necessitated in such a plan the position of the altar being moved some bays down the church, towards the centre of the nave, by which arrangement many of the worshippers in the large aisles would have found themselves during the missa behind the altar and the officiating priest, instead of in front.

It seems to me there could have been no other logical reason for the departure from the first method of arrangement, which brought the altar in greater proximity to the congregation; and from this departure by gradual steps our mediæval choirs were evolved, resulting eventually in the abbey churches in the entire shutting off of the altar, clergy, brotherhoods and choirs from the congregations by the elaborate screens even now remaining in many churches both here and abroad.

It was then found necessary to place in the nave, outside the choir, or rood screen, an altar, as at Lincoln and York, for the popular services. There was a great screen between the western piers of the central tower, the altar in the middle and doors on either side. A necessity for this altar for popular or congregational services is felt at the present time in some of our cathedrals, as at Norwich, in consequence of the enclosed choirs still remaining.

Does it not seem evident, from the variations at different times of the arrangements made to suit the feelings and education of the ages, that there can scarcely be said to be a hard-and-fast line drawn, or any grave law that would be broken if the present plan of accommodation of our tripartite arrangement of congregation, choir and sacrarium were somewhat altered to meet modern requirements, however much in some respects our sentiment and conservative feeling make us averse to alterations?

Mr. J. Macvicar Anderson, in proposing a vote of thanks to Mr. Emerson, referring to the question of competitions, said he disagreed with them altogether. He thought Mr. Emerson should have been appointed architect of the new Liverpool Cathedral, as the author of the best design in the previous competition.

Mr. G. H. Fellowes Prynne seconded the vote, and strongly endorsed Mr. Anderson's remarks regarding Liverpool Cathedral.

The vote having been accorded, Mr. Emerson in reply, said he was of course naturally disappointed with the result of the previous competition, but he thought the Liverpool Cathedral committee were only actuated by a desire to obtain the best design possible, and he would be glad if such were better than his own. He had long ago abandoned the idea of the scheme ever maturing during his lifetime.

BUILDING CONSTRUCTION.

(*Continued from p.* 203 *of No.* 351.)

THE student should note any examples of trusses which he may see in railway-station roofs, &c. He should pay particular attention to the cross-sections of parts, and also to the way in which the connections are made at the joints, and he should compare the actual things he sees with drawings given in books and any practical designs which may reach his hands. He has to consider not merely what is strongest and best, but what can be most easily made by the smith or other workman so that the cost will not be too great.

27. If a roof-covering consists of common rafters, sheeting and slates resting on the purlins which bear upon the trusses, it may be seen that it may be to a considerable extent self-supporting. Suppose we have a rectangular area covered by a slated roof hipped at the ends. If we make a stiff paper model of this roof-covering we shall find it self-supporting within limits of size. We may look upon a side of a roof of this kind as being a very deep thin girder bearing along its whole bottom edge, and then laid over to the angle of the roof; if now we have a stiff ridge well supported on the hip-rafters and mitred sheeting, &c., it will stand well against the pull of the sides. The weight of the sheeting will make it curve inwards; and instead of the thrust outwards to the walls which is usually provided for, there will be a dragging inwards. I do not desire to give undue weight to these considerations, but the student should, while paying all proper respect to the usual ways of looking at things, try to look at them in ways of his own. I specially caution young students that they should guard against the idea that they have invented some new thing when they think out arrangements somewhat different from what appears to be the common arrangement. If the roof is made strong enough, assuming that it spans from top to top of two parallel walls, it will certainly be strong enough for any other condition. For moderate spans it is sufficient to rest the trusses on sufficient plates to distribute the weight on the masonry or brickwork, but it must be remembered that the ends of any truss are subject to horizontal motions. In the case of iron trusses, the iron being a good conductor of heat, variations of temperature very considerably affect them—the trusses lengthen and shorten appreciably, or if prevented they are subjected to great stresses, or they must buckle or yield in parts. Any kind of truss varies in length, being strained with heavy loads and less strained with lighter loads, during the course of a storm. We may think of these horizontal movements either as a creep of the bearing of the truss on the top of the wall or, if the pressure and friction are great, as producing rocking or bending movement of the wall. It is sometimes assumed that if a truss rests on roller-bearings it gives a true vertical load to the wall, but this is not so; roller bearings only diminish the friction; they do not do away with it altogether. As a rule, such bearings are never examined; the plates get rusty or dust covers them, and the bearings are never free. There is some danger of the truss creeping more in one direction than the other. Thus, suppose a truss to lengthen 2in. It may make this 2in. at one end, and when it comes back to its normal length it may drag this 2in. from its other bearing; it may be prevented going too far by the roof structure confining it, but it may in this way put evil stresses on the structure. A better plan in important cases is to make the ends of the trusses rest on short stirrups or shackles which hang from the plates which distribute the load on the masonry. The reactions where stirrups are used may not be exactly parallel in all conditions of loading, but they may be made approximately so. It is useful to remember that the shearing strength, the tensile strength, and the crushing strength of iron are nearly equal, and for trusswork the safe load may be taken at 4 tons per sq. in. of section. A bar of iron 1yd. long and 1 sq. in. in section weighs 10 lbs., or a square foot 1in. thick weighs 40lbs. Remember that struts must be of such sections as will strengthen them to prevent bending sidewise, and that when struts are long they must be heavier than the 4 tons per sq. in. rule would allow them to be; because on the strut being stressed any slight irregularity in symmetry of section, or want of homogeneity in the iron, will allow the line of thrust to lie to one side of the centre of gravity of a cross-section, and consequently the whole of the section is not available to withstand the thrust.

28. We have to design iron trusses for a roof of 30 degs. pitch; span of truss, 72ft.; roof-covering, slates on sheeting (1in.), on common rafters (5in. by 2in.), purlins (7in. by 4in.); trusses spaced 10ft. apart; trusses to carry the whole weight of the roof and ceiling, below ties of trusses; ceiling on 5in. by 2in. joists, resting on pieces 9in. by 4in. suspended from joints along tie (at middle from apex).

Expansion.—The range of temperature may be taken at 50 degs. C.; the variation for this range may be taken to be ·0006, 72 × 12 × ·0006 = ·5184in., or slightly more than ½in.

To ascertain the load on a truss we must know its weight, and we cannot know its weight till we know the stresses in its parts. Assume a weight for the truss, and correct it by one or more trial calculations.

Assumed weight of truss - -	4,000 lbs.
Purlins - - - -	1,265 „
Common rafters - - -	2,188 „
Sheeting, &c. - - - -	3,225 „
Slates, &c. - - -	5,241 „
For one bay - - -	15,919 „
Ceiling - - - - -	10,080 „

Wind-pressure, 40lbs. per ft. super. at right angles to surface of roof on left side; total on bay, 16,800lbs. Pattern of truss, that of Fig. 29 (*see* last week's issue). The weight of the truss itself is dealt with as if it were distributed over the top joints, which of course is not the case; and the truss rafters are taken as jointed, which they are not.

First treat the truss represented by its skeleton lines as a rigid body. The loading as found above is distributed as shown on the drawing (Fig. 32). The line A H represents in magnitude and direction the balancing force which must be applied to the truss. Assume the reactions of the walls to be parallel, they will be parallel to this line, and their sum will be equal to it. To find the amount of the reaction at a take moments about a'.

2900 × 351 = 1017900
5 × 4000 × 240 = 4800000
2800 × 150 = 420000
5 × 1326 × 91 = 603330
5 × 1680 × 182 = 1528800

357)8370030(23445 lbs.
714
1230 etc.

The reaction at a is therefore 23,445lbs., and that at a' is 18,250lbs.

The truss is now dealt with as a jointed structure, and the stresses in its parts are found as shown in Fig. 32. It has been said (paragraph 25) that we can always determine two sides of a polygon if we are given the other sides and the angles of the polygon; and that if more than two sides are unknown the question is indeterminate. We find when we reach the middle joint on the left rafter that we appear to have a case of this indeterminate kind, and if the joint was unconnected with other joints it would be indeterminate; we find, however,

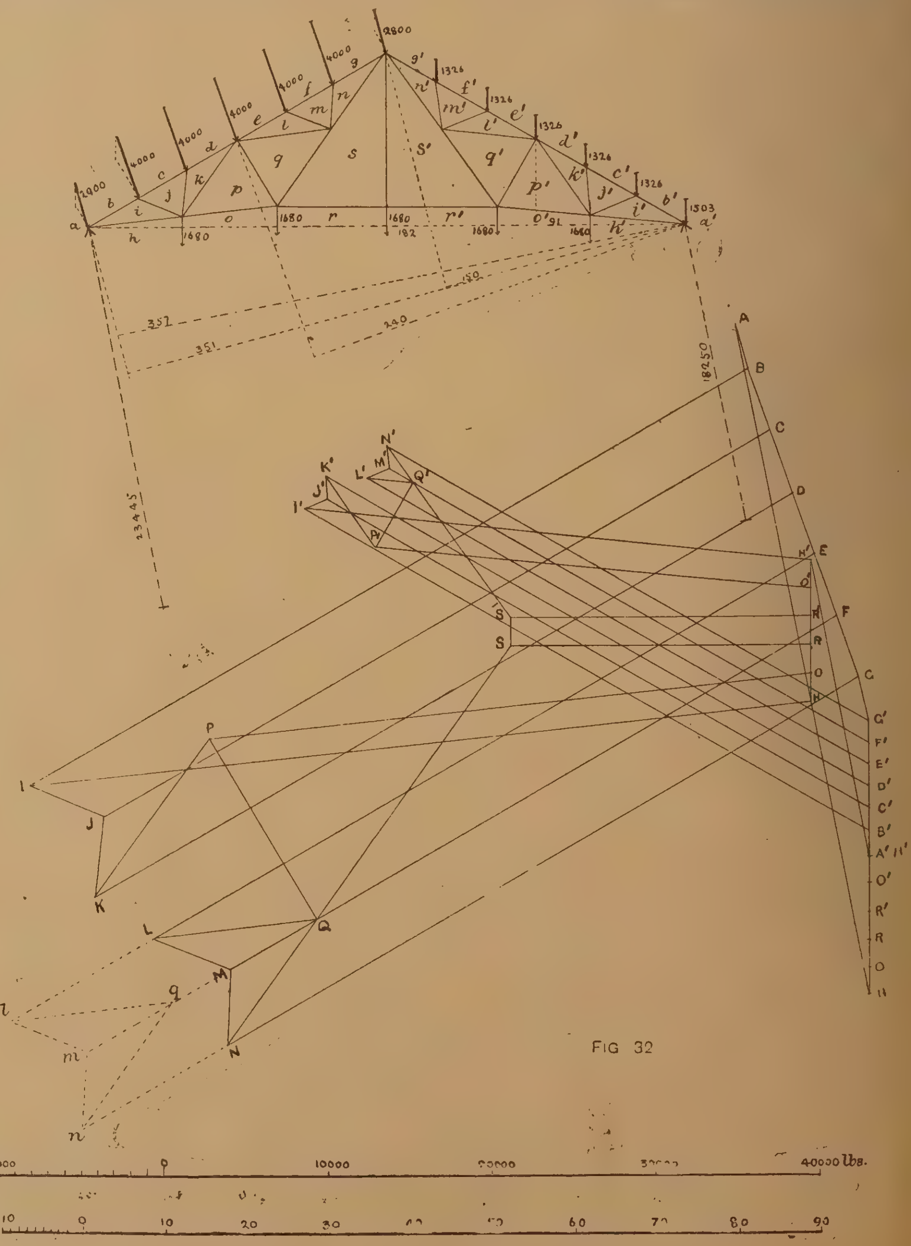

FIG 32

that its relation to the other joints of the truss enables us to determine the stresses in the members of this joint. We have found the point P, and we know the direction of P Q, for which we draw the line. Proceed round the joint in the direction with the hands of a watch and find K and D and E; but L we cannot find just yet. We know that it must be in the line E L; assume a point l, and from l draw $l\,q$ parallel to the member, but the length of $l\,q$ is not known; to find this length we draw $l\,m$, and because $l\,m$ is a member of the joint on the rafter, m must lie on the line F m; thus m is found. From m draw $m\,n$ parallel to the member; and for the same reason that m lies on F m, n' lies on G n; $n\,q$ may now be drawn. Now consider the joint $q\,l$, $l\,m$, $m\,n$, $n\,s$, $s\,q$. N, Q and S must be in the same straight line; the point l is therefore moved up to L, n is moved to N so that q rests upon the line P Q at Q. The point L has now been determined, and the remainder of the construction presents no difficulties. The student should notice that the polygon drawn to determine A H′ when the truss is considered a rigid body is made use of in the second part, where the diagram of stresses is drawn. When we reach the point marked A′ H′ in the stress diagram we know the reaction at a' and we draw it upwards to H′, and we draw from H′ downwards the loads on the joints of the tie and also the hanging load from the apex. When we reach the joint $i'\,j'\,c'\,b'$ there is only one stress to be found, and the drawing must satisfy the other stresses about the joint: in the case before us it does so fairly well, and we may assume that the drawing has been done with fair accuracy. It is seen that the stresses on the windward side are in every case greater than those on the lee side: the diagram shows the maximum stresses, and the members of the truss must be made to bear these *maximum stresses*. The rafters are in compression, but the rafters are held from bending sidewise by the purlins; from bending upwards by the weight of the roof; and from bending downwards by the members of the joints: each rafter may be taken to be a series of short struts, placed end to end. The only struts of more than moderate length and load are the two struts P Q. These struts are about 10ft. long, and their load is a little over 15,000lbs., say seven tons: if they were ties, a cross-section of less than 2 sq. in. would be sufficient; as struts it will be advisable to give them, say, 6 sq. in. in cross-section, or possibly more when we examine the conditions carefully; but this is a trifling matter. The struts $i\,j$, $j\,k$, $l\,m$, $m\,n$, are short and the loads upon them are small. Next take the maximum stresses in the several members in tons, divide these separately by 4 (four tons) to get inches of cross-section, making allowances for long struts; these quotients multiplied by the lengths of the members in ft. will give the number of ft. of a rod of iron 1in. sq. which would equal the iron in the truss; this divided by 3 will give the quantity in yards; and this multiplied by 10 will give the weight in lbs. Make a fair allowance for bolts, &c.—fastenings at the joints and bearings. The rough assumption of 4,000lbs. as the weight of the truss is sufficiently near the actual weight to make it unnecessary to substitute a corrected weight and to draw a fresh diagram.

Cross-sections.

Rafters 6 sq. in., cross-section say 2 angles 4in. by 4in.; small struts, 1 sq. in., cross-section say 2in. by 2in. angles; large struts, 6 sq. in., cross-section say 2 angles 4in. by 4in.

$h\,i$, $o\,p$, $q\,s$, and $n\,s$ may be all made of the same sectional area to have a joint at the lower end of P Q, sectional area 6 sq. in.—two straps 4in. by ¾in. each, swelled without loss of section for bolt holes at joints.

$r\,s$, 3 sq. in. cross-sectional area; 2 plates swelled at ends for bolts, 3in. by ½in.

Bearings and Joints.

The alteration in length from changes of temperature being as we found half an inch, a truss of this span may fairly be placed on stone or concrete templates without any provision for expansion further than the slight yielding of the walls or of the truss on its templates. A packing of indiarubber, if we could depend on the permanence of this substance, would be useful; thick felt pads may be placed between the bearing of the truss and the template; the ends of the truss may be supported on links. I hope to show sketches of the joints and bearings with the next article.

The working of this question shows the directness and simplicity of the method followed in these articles. The expedients sometimes adopted to evade the general method, as taking the wind-load separately from the other load, assuming the reaction of one wall vertical, &c., introduce complications and burden the memory. It may interest students who have hitherto followed drawing-card methods to account for the small differences which appear in these diagrams from those to which they have been accustomed. I have not patience for such an exercise myself; but in a book of diagrams before me it would appear that when the wind-pressure polygon and load polygon are taken separately, and the reactions compounded on the walls, these compound reactions are never parallel.

(*To be continued.*)

Law Cases.

Fire Escapes from High Buildings.—At Westminster last week, under the provisions of the London Building Act, 1894, Mr. W. Reekards, the building owner of a large block of high buildings let as flats at Buckingham Gate, was summoned for penalties for allowing occupation of the storeys over 60ft. from the ground level without a County Council certificate that there were adequate means of escape in case of fire. At present staircases were the only means of escape. Last July the defendant was fined at this court in respect of these flats. Fresh plans had been submitted since, but they were incomplete and unacceptable. Mr. Biron, counsel for the defendant, said that a builder was placed in a position of great difficulty because no definition of what was actually required could be obtained from the County Council officials. The defendant was most willing and anxious to do all the Council demanded, and for plans to be approved he asked for an adjournment. Mr. Horace Smith thought that this was reasonable, and granted a month's adjournment.

Re Sydney Knight.—A first meeting of the creditors of Sydney Knight was held last week. The debtor had carried on business as a builder and contractor at 347, New King's Road, Fulham, S.W., and he furnished a statement of affairs showing liabilities £38,318, of which £3,224 17s. 3d. was returned as unsecured, and assets estimated to produce a surplus of £689 2s. 4d. It appeared that the debtor had failed on a previous occasion. In 1897 he embarked on building speculations for the erection of flats, &c., at Hurlingham and Wimbledon, and he also erected houses at East Sheen and Walham Green. He endeavoured to sell the flats to a company, but states that his endeavours were unsuccessful owing to the war. He does not consider that he is insolvent, and attributes his position to undue pressure by creditors, and to other causes. No offer of composition was now made, and Mr. F. W. Davis, chartered accountant, was nominated as trustee to administer the estate in bankruptcy, a committee of inspection being appointed.

Notifying Completion of Buildings.—At the Birmingham Police Court on October 25th Thomas Wright, 342, Bristol Road, was summoned for failing, within a reasonable time after the completion of a building in Moor Street, to send a written notice to the surveyor that the work was completed. He was fined 20s. and costs, and a similar amount for occupying the premises.

Building Sites.—At Rotherham West Riding Police Court on October 28th George Pugh, builder and contractor, of Rawmarsh, was summoned at the instance of the Rawmarsh Urban Council for two breaches of the council's building by-laws. The case for the prosecution was that Pugh had not, in accordance with by-law 10, asphalted or covered with a layer of good cement the site of a building he had erected in Wheatcroft Road, Sandhill, Rawmarsh, and also that he had not used proper mortar. A fine of £5 was imposed for the breach of by-law 10, and a fine of 20s. in respect of the other by-law. There were also £4 4s. costs.

Fireproof Construction in Tenements under the L.B.A.—At Marylebone on October 27th, Alfred Bush, of 6D, Ridgmount Street, Gower Street, appeared to a summons, issued at the instance of Mr. Arthur Ashbridge, district surveyor for Marylebone, for making, in the erection of a building at the corner of Paradise Street and Ashland Place, Marylebone, default to comply with a notice of irregularity under the Building Act. The building is the property of the Portland Industrial Dwellings Co., and is intended for occupation by artizans. It was agreed on both sides that, the building being over 125,000 cub. ft. in extent, section 68 of the London Building Act applied. It was provided by that section that in every public building, and in every other building of more than 125,000ft. of cubical extent, which was constructed or adapted to be used as dwelling-houses for separate families, the floors of the lobbies, corridors, landings and flights of stairs should be of fire-resisting material and be carried on supports of a similar material. But it was also contended by the complainants that the building, being over 25 squares, or, in other words, covering more than 2,500 super. ft., should conform to section 74, subsection 3, which required that all the floors of the rooms, as well as those of the lobbies, &c., should be fireproof. Apart from that matter no exception was taken to the building. Mr. Moyses urged that section 74, subsection 3, only aimed at large buildings like flats, containing three or four rooms, intended to be occupied by different persons, and with an outer door. The object of the company he represented was to solve the most acute problem of finding dwellings for the industrial classes in congested districts. Every one of the rooms in the building in question might be let off separately. They therefore thought it was oppressive and unreasonable to try and compel them to incur the great expense of making the floors of even the smallest rooms fireproof. Mr. Plowden, in deciding the case, said that the whole question seemed to be what was a fair meaning to be placed on the words of the Act that in every building "containing separate sets of chambers, offices or rooms" there should be fireproof floors. In his opinion "separate sets" had nothing whatever to do with offices or rooms, but referred simply to chambers. Every kind of room, office or set of chambers which was inhabited at all should therefore have fireproof floors. Consequently he held that this building contained sets of chambers or rooms, or, even if not sets, they contained rooms which required fireproof floors. His order would be that the defendant should comply with both section 74, subsection 3, and section 68 of the Act, and pay £5 5s. costs.

Defective Gulley Gratings.—The case of *Jones* v. *Mayor and Corporation of London* was heard last week in the King's Bench Division of the High Court of Justice. Plaintiff claimed damages for personal injuries alleged to have been sustained through the negligence of the defendants. The Corporation denied negligence, and pleaded that they were liable for misfeasance only, and not for non-feasance. The case raised an important question as to the liability of local authorities. Plaintiff stated that on November 27th last, whilst hurrying down Fleur de Lis Court, he fell down a rainwater gulley, some parts of the grating of which were between 1½in. and 2in. below the level of the road. Mr. Justice Darling said in his opinion there was a case to go to the jury, having regard to the case of *White* v. *Hindley Local Authority*. In that case the late Lord Blackburn said: "The placing of this grating over the opening from the road into the sewer evidently was done with two objects—one to prevent the hole from being dangerous, and the other . . . to prevent stones and other matter from passing through. One purpose was, therefore, a road purpose, and the other a sewer purpose; and the grating being there for both purposes, the defendants have at least a joint liability with themselves as surveyors of highways in their capacity of owners of the sewers." There was in this case some evidence that the defendants had not kept the grating in a proper state, and, according to the decision he had cited, they might be liable as owners of the sewers, though not as surveyors of highways. The jury found a verdict for the plaintiff, and assessed the damages at £60.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
	BUILDING:		
Nov. 7	Rothes, Scotland - Cottage	—	J. Smith, Estate Office, Elgin.
,, 7	Newmarket - 75,000 Blue Bricks	Urban District Council	J. W. Metcalf, Surveyor, Town Hall, Newmarket.

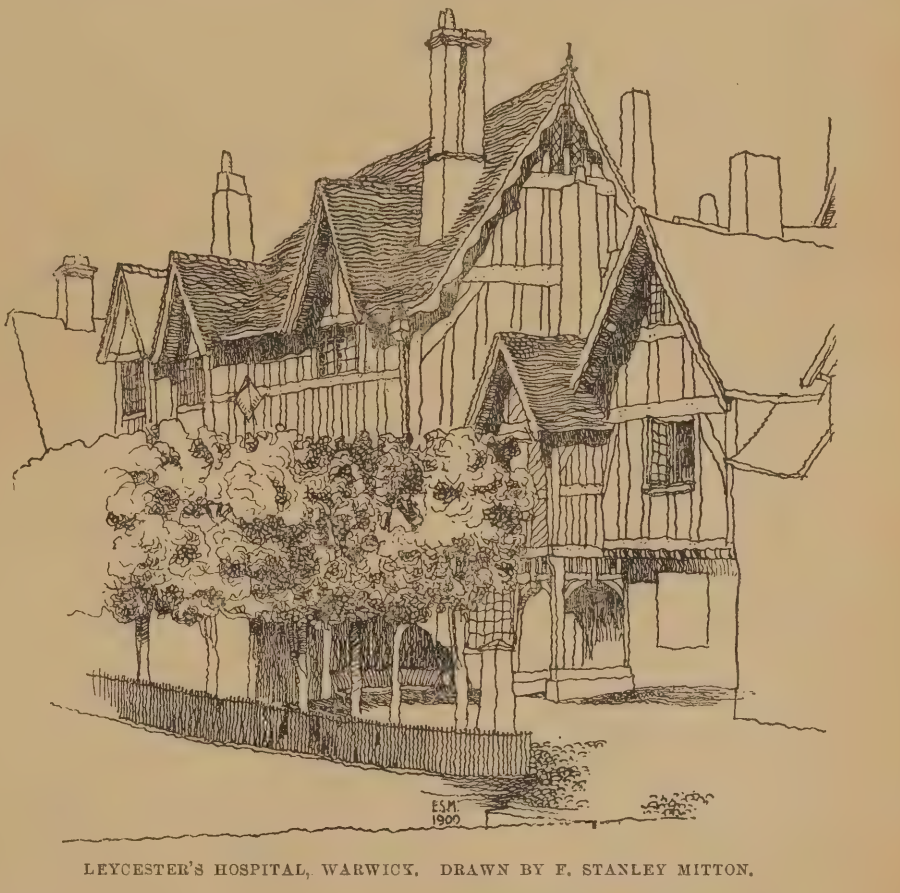
An Architectural Causerie.

Spoiling the Thames. THE London County Council have preserved the magnificent view from Richmond Hill by deciding to pay half the cost of purchasing the Marble Hill Estate, which is sixty-six acres in extent. The actual contributions to be made are as follows:—Middlesex County Council, £12,000; Surrey County Council, £10,000; City Corporation, £5,000; Richmond Corporation, £5,000; Twickenham Council, £3,000; Hammersmith Council, £1,000; London County Council, £36,000. This purchase preserves from the builder's hands the bulk of the wooded land on the Middlesex side which can be seen from the Terrace at Richmond, and it is fairly certain that the opposite shore will be saved by Lord Dysart giving up his remaining manorial rights over Ham and Petersham Commons, Ham Fields, Petersham Fields, and granting a strip of land, at least 150ft. wide, extending for two miles from Twickenham Ferry to the One Tree, near Kingston. The view from Richmond Hill is saved, but the builder will soon be busy higher up the river. Beyond the Marble Hill Estate he is felling down the fine cedars and covering the ground with drain-pipes and road-making materials. Further up, again, on Eel Pie Island, the auctioneers' board foretells what will follow, and similar boards can be seen at and above Teddington. The speculative builder cannot be stopped. He will erect his houses, and these will spoil the beauty of the Thames. If anyone wants a proof of this, let him look at the Cambridge House Estate just above Richmond Bridge. There he will see enough to sicken him of the modern builder.

Leycester's Hospital, Warwick. THIS fine example of half-timber construction stands on the western side of High Street, Warwick. It originally belonged to the Guilds of the Holy Trinity and the Blessed Virgin and St. George the Martyr, and it appears to have been erected about the reign of Henry the Sixth. Dugdale tells us that the inmates of the hospital, who were to be twelve in number besides the master, were to be "impotent persons, not having above five pounds per annum of their own, and such as either had been or should be maimed in the wars in the said Q's. service, her heirs and successors, especially under the conduct of the said Earl or his heirs, or had been servants and tenants to him and his heirs, and born in the counties of Warwick or Gloucester, or having their dwelling there for five years before; and in case there happen to be none such hurt in the wars, then other poor of Kenilworth, Warwick, Stretford-on-Avon, in this county, or of Wotton-under-Edge, or Erlingham, in Gloucestershire, to be recommended by the minister and churchwardens where they last had their aboad; which poor men are to have liveries (viz., gowns of blue cloth, with a ragged staff embroidered on the left sleeve) and not to go into the town without them." The garden of the hospital is very tastefully laid out, and commands a fine view of the adjacent county. The chapel, which adjoins, is dedicated to St. James and reaches across the West Gate. It is neatly fitted up for the use of the master. The building gains considerably in the twilight, rising from the foundation of rock with the flying buttresses added in 1863, making all together a fine skyline against the setting sun.



LEYCESTER'S HOSPITAL, WARWICK. DRAWN BY F. STANLEY MITTON.

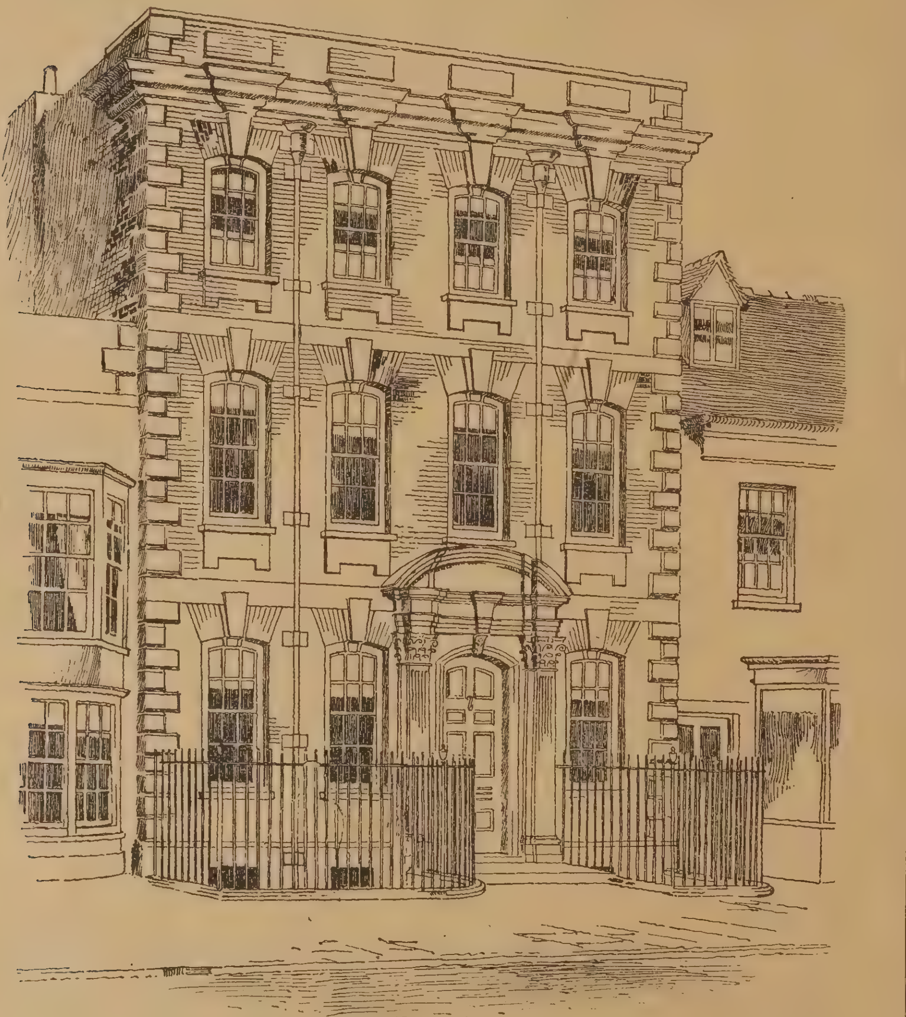
The Liverpool Faction. WE were glad to be able to announce a fortnight ago that the Liverpool Cathedral Executive Committee had (apparently) seen their mistake and decided not to restrict the competition to Gothic designs. They are now hard at work trying to raise subscriptions, and have actually appointed an organization secretary at a stipend of £200 a year, with second-class travelling and out-of-pocket expenses. In the meanwhile we may just look at the amended conditions published. Architects—both those who have been engaged in the erection of cathedrals and churches, and those who have not, but "whose tastes have led them to study and design buildings of an ecclesiastical character"—are invited to send in by June 30th next drawings and other illustrations of their work, or a cathedral design. The portfolios will be carefully examined by the Committee, with the assistance of professional advisers, and a few architects will be asked to submit designs for the proposed cathedral at three hundred guineas apiece. It is only fair to give the Committee the benefit of any doubt, but it is certain that they do not enjoy the full confidence of the architectural profession. The following letter, which we recently received from a correspondent, voices the thoughts of many people: "It does not appear to me that much has been gained by the concession of the Liverpool Cathedral Committee. As things stand, their action suggests the amiable conclusion that it pleases the profession and in no way affects the Committee. Surely no architect would send a design other than Gothic to so biased a body, unless guaranteed that the final decision shall rest with an impartial assessor." Of course it all depends on who the "professional advisers" are, though it is fairly certain that they will be Gothicists. The Committee should name their assessors first. However, it is futile to argue the question any more. "Convinced against their will, they are of the same opinion still;" and so there's an end of the matter.

Street-Lighting in Fog. ABOUT a year and a half ago we took occasion to point out that the lighting of streets by electric arc-lamps of great power, placed on high standards at considerable distances apart, was not scientific, as it simply meant a greater dead-point and more intense darkness between the lamps. During foggy weather like that recently experienced in London the defect is much more noticeable, and the observations made by Mr. L. F. Vernon Harcourt, M.I.C.E., whilst walking down Gower Street in a thick fog, are worthy of careful consideration. In this street electric arc lamps, duplex incandescent gas lights, and ordinary gas lights are fixed. The arc lamps near University College gave a brilliant light close to the high standards, but midway between the standards the lights were entirely obliterated by the fog, and the complete darkness appeared the more intense after the preceding illumination near the standards. Further on the double incandescent gas lights in the ordinary gas lamps, being much lower and nearer together than the arc lights, were never lost sight of. The ordinary old fashioned gas lights, reached at Bedford Square, gave a decidedly less effective illumination than the duplex incandescent gas lights, but were very much superior to the arc lights. Just beyond Bedford Square a low brilliant electric arc light at the entrance to some flats happens to be close to an ordinary gas light, and on proceeding towards Oxford Street the two lights, though presenting a great contrast close by, were almost simulaneously lost sight of through the fog. These observations prove that electric arc lights as being put up in London, owing to their height, their distance apart, and their relative deficiency in penetration through fogs, provide a most unsatisfactory method of lighting in the foggy weather to which the Metropolis is so subject during the winter months.

HIGHWORTH, WILTS.

BY PROF. G. R. BENNETT AND H. T. REES.

RURAL England abounds in historical associations. In the speech of the peasant are many obsolete words and phrases, common and correct in the language of our ancestors. From the stories told round the fireside of the village inn we gather much concerning the habits and customs, the games and pastimes, of olden days. Then there are innumerable buildings standing as eloquent witnesses of the development of our national and social life. Throughout the country are scattered small old-fashioned market towns, reminiscent of the days when prosperity dwelt in agricultural districts; and here one often finds some structure suggestive of old romance or mediæval mystery.



MANSION IN THE HIGH STREET, HIGHWORTH, WILTS, ATTRIBUTED TO INIGO JONES.

Very typical of such places is Highworth, in the north of Wiltshire. It was formerly known as Vorda, but, probably owing to its position on an eminence overlooking the valley of the Isis, it became High-Vord and then Highworth.

There it lies on the hill top, the old houses clustering around its church, whose square-built tower is a landmark for many miles around. The principal street is wide, and its quaint old buildings with gabled dormer windows and stone roofs make it very picturesque, the effect being heightened by the old cobble pavements which until recently edged the road.

Visitors generally make their way to the old church first. It is dedicated to St. Michael, and is a fairly good specimen of fifteenth-century work, consisting of a nave and two aisles. It is said that at the time of the Civil War between the Royalists and the Roundheads the town, being loyal to the cause of the king, was besieged by Cromwell's Ironsides. At this stirring time the church became the last stronghold of the defenders, and a hole in the stonework over the door at the west end is pointed out as evidence of the bombardment which the garrison had to endure. Whether this is true or not it would be rash to say, but an old workman who was engaged in the restoration of the church some years ago asserts that he saw sufficient leaden bullets taken from crevices in the walls to fill his hat, and it was a capacious one as hats go nowadays.

In the town's heyday, when large markets were frequently held in the old market square and the annual Lammas Fair and Michaelmas Mop, or Hiring Fair, were well patronised by the well-to-do farmers and their servants, inns were in great requisition, so that nearly every other house carried a sign bearing some fantastic design such as the "Cross Keys" or the "Saracen's Head." Many of these inns have recently closed their hospitable doors, but some still remain, with their signs suspended on good wrought-iron brackets.

The "King and Queen," in the main street, is specially worthy of notice, with its signboard projecting far over the road. It has on the first floor a large bay carried on wooden posts over the entrance. Another is the "Red Lion," which, facing a sunny square paved with cobbles, looks very quaint and charming with its bracketed cornice and leaded lights. Old inhabitants can remember when the stocks stood in the open space in front of this inn, and here the ring was fixed to which the bull was tied when bull-baiting was a favourite sport.

On the opposite side of the market-place is a Tudor house bearing the date 1632. It has some good detail, but has followed the fortunes of the town, and is now divided into two smaller dwellings. As originally built, the house had a four-centred Perpendicular doorway, which has been filled up with rubble walling, leaving a space for an ordinary ledged door, a similar one being inserted in the blank wall-space between the two bays. The leaded lights have been removed from both floors of one bay and replaced with modern wooden casements, the transoms having been removed from the lower-storey window to accommodate these. Altogether, the effect has been much spoiled.

In the High Street is a fine red-brick mansion attributed to Inigo Jones. It is probable that he did design it, as he also designed Coleshill House, which is situated about two miles outside the town. The mansion has a good stone doorway with fluted Corinthian pilasters, but it is regrettable that its pediment is so broken up, a fault also apparent in the main cornice of the building; this tends to over-emphasize the keystones of the upper windows. Further down the street is a house of humbler dimensions, now converted into the local post-office, with a plain stucco front, but it has a finely-carved doorhead, which is shown among the accompanying illustrations.

Views & Reviews.

Early English Renaissance.

This book by Mr. J. Alfred Gotch is an admirable contribution to the history of the English Renaissance. It does not clash with either the author's other book, which was a series of examples, or with Mr. Blomfield's "History of Renaissance Architecture in England," as it deals with the development of the style from the close of the Gothic period down to the advent of Inigo Jones. The book is admirably illustrated and most lucidly written, and it should be of great value to students of this period, or to those preparing for the architectural societies' examinations. The book is especially interesting also in tracing the gradual extinction of the Gothic tradition from this early beginning in the stimulation of a taste for Classic architecture by the Renaissance in literature and the training of our young nobles in Italy. Considerable space is devoted to John Thorpe's remarkable collection of drawings. Little space is, however, devoted to gardens, a most fascinating study. We can heartily agree with the following remarks: "It is the work of the men who were baffled that we are now to examine: work which, judged from the standpoint of their better-tutored successors, may almost be regarded as a failure, but work which exhibits a vitality, a fancy and a sense of romance for which we look in vain in the more correct architecture of the eighteenth century." It will always be the common-sense and naïvete which will give interest in architecture, and the delight of the workers will be shared by the beholders far more than any staid academic classicism will be.

"Early Renaissance Architecture in England." By J. Alfred Gotch, F.S.A. London: B. T. Batsford, 94, High Holborn, W.C. Price 21s.

Valuations and Compensations.

This book, by the late Prof. Banister Fletcher, like its companion volumes of the series by the same author, forms an admirable and most useful text-book. The need for a second edition has given the opportunity for the present editors to make considerable revision. The importance of making each valuation on its own merits is wisely insisted upon: "It is essential to study each property very minutely on the spot, and to consider all its qualifications having regard to all possibilities that may arise in the future. Valuation tables will not make a valuer, and should only be used after the survey is completed on the site." A complete example of how a valuation for a compensation claim may be arrived at is given at the end of the book, and will help the student more than many chapters of particularization.

"Valuations and Compensations." By the late Prof. Banister Fletcher. Second Edition. Revised and rewritten by Banister F. Fletcher and H. Phillips Fletcher. London: B. T. Batsford, 94, High Holborn, W.C. Price 6s. 6d.

SIR MARTIN CONWAY ON ART.

At the Museum of Classical Archæology, Cambridge, last week, Sir Martin Conway delivered his inaugural lecture as Slade Professor of Fine Art. Referring to his recent travels, he said it was exactly ten years since the study of art-history ceased to be the main preoccupation of his life and was exchanged for the engrossing cares and excitements of a more active career. He could not, therefore, stand before them clothed in the panoply of complete knowledge of the latest discoveries in art-history or the finest *nuances* of recent art-criticism ; but art was wide as life itself, and whoso had once given himself to her never escaped her sweet enthralment.

Latent Faculties.

After giving a definition of art, and pointing out that the pleasure which art exists to produce is not the maker's, but that of another, the Professor urged that the two human faculties which a work of art implied, the creative and the receptive, were both capable of development. By no known process could they with certainty originate either faculty in a man wholly lacking in it, if such person there be. But where the faculty existed it could be developed. The conviction that this is so was shown by the multitude of art schools wherewith civilised countries were now provided. The primary purpose of such schools was to equip artists with the requisite technical skill to enable them to express such emotions of beauty as might arise in them.

The secondary purpose, often far too much neglected, was by bringing the student in contact with noble works of art of various kinds and under the influence of as stimulating a teacher as possible, to feed and develop his sense of beauty, and thus provide material for his skill to express. It was a remarkable fact that the other faculty, equally essential to the life of art in a country, the perceptive faculty, received hardly any attention at the hands of educationists.

Public Taste.

Governments and municipalities would spend money enough on making artists, who when made would be unable to live unless each of them could find a considerable body of amateurs to buy his work. Yet the same Governments and municipalities which subsidised art schools were by no means correspondingly intent on developing the perceptive faculty in the purchasing public. They would hold an occasional exhibition, and even perhaps form a permanent gallery of paintings as though pictures were the only art, whilst in the incompetent planning of new streets and erection of public monuments and buildings, in the obliteration of open spaces, the destruction of scenes of natural beauty, and such other perverse object-lessons, they more than counteracted the educational effect of their vaunted exhibitions.

The Effects of Taxing Site Values.

Take a contemporary instance. A body of public opinion was now forming in favour of what is called the taxation of site values. This might be a proper or an improper means of raising revenue. He had nothing to say for or against it on that platform. What he did observe, however, was that neither its proposers nor its opponents seemed to have made the smallest attempt to consider what effect such taxation, in the form in which it was shadowed forth, was bound to have upon the beauty of our towns. Such a tax would fall with ruinous effect upon the owners of open spaces and plots of garden-ground not yet invaded by the flat-builder.

Now one of the greatest glories of London was its little private gardens, remnants of the country engulfed in the great city. These little gardens were not merely a joy to their owners but also to all the neighbours whose windows commanded a glimpse of them ; and they formed valuable lungs even for houses that were out of sight. So far from garden-owners being penalised in a great city, they ought rather to be endowed. Whatever legislation tended to cover every inch of ground in a city with buildings was pernicious. The pressure of population and the natural desire of a landowner to make the most profitable use of his property already exercised an almost irresistible impulse to abolish private city-gardens. In England this was to some extent counterbalanced by the Englishman's inherited love of Nature and of life in contact with Nature. That most healthful sentiment should be encouraged in every way for the common good. Every scrap of land kept as a garden in a city should be rated and taxed on the lowest scale.

TUDOR HOUSE FACING THE MARKET SQUARE, HIGHWORTH.

Committees and National Monuments.

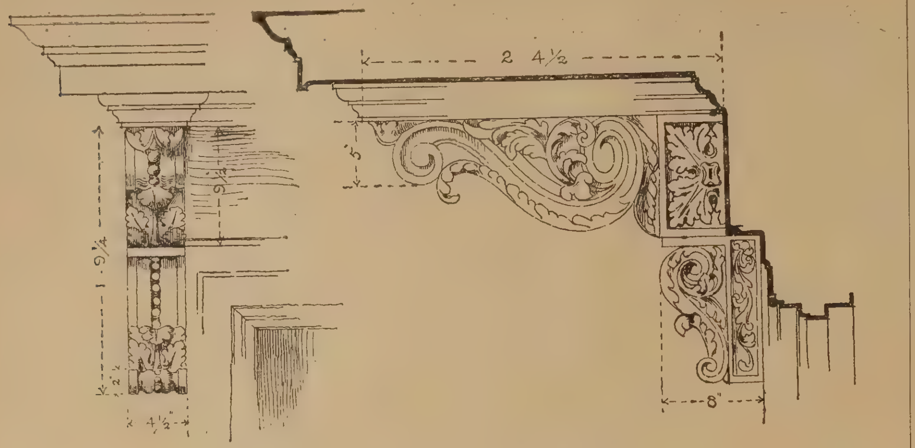
Another social habit of ours which blighted nascent popular taste was that of confiding to committees of more or less eminent gentlemen the ordering of local or national monuments. Artists who had had experience of them were unanimous in declaring that it was almost impossible to produce good work under the supervision of a committee. Utterly detestable, too, were so-called competitions when a selected or an unlimited number of artists were invited to submit designs. England was not a country of hopeless Philistines. Possibly it did not contain a larger percentage of Philistines than Athens did in the day of Pericles. It was the structure of our society that was Philistine, not the units of which society was composed. From the point of view of art our Governmental methods were faulty, but they were not incapable of reform. Look across the ocean to our kindred ; they would find a similar society to our own in which art had taken firm root. Their monuments, their public buildings, their sky-scraping office blocks, were far superior to corresponding modern products here.

The spirit which had been infused in quite recent years into the people of the United States might likewise be infused into our own folk. It was not the desire that we lacked, but the understanding how collectively to go to work to attain the end which all desired.

Individualism.

A work of art for the enjoyment of all was essentially the conception of one. Your artist, if he was to do his best, must be the autocrat of his own work, having over it the same responsible independent command as a commander-in-chief has over his army in the field. The curse of the ill-equipped amateur blighted our national life to-day. The fact had been recently and emphatically pointed out. The great need of the present day, from the point of view of the production of fine art, was the education of the amateur, the purchaser. How was this to be accomplished, or even attempted? That was the problem that faced each occupant of the Slade Chairs at Oxford and Cambridge for to answer that question was the end for which they were founded. They had to endeavour to awaken in the youth of the University a sense of the charm and beauty of fine art. It was his duty to tell them that art was a necessary part of healthy human life—that there was nothing effeminate about it, nothing unhealthy, nothing ignoble.

"THE KING AND QUEEN" INN, HIGHWORTH.



DOOR-HEAD TO POST-OFFICE, HIGHWORTH.

ANGLO-INDIAN ARCHITECTURE.

Its Characteristics and Defects.

THOUGH we have had a permanent footing in India for more than two centuries, we do not seem to have even begun to evolve an order of architecture adapted to the conditions of life there. In every country practical experience has led the inhabitants to adopt some distinctive style in the construction of their habitations, suited to the climate on the one hand and to their means and resources on the other. The Eskimo has his snow house, while the native of Borneo raises his airy hut on piles high above the swampy ground. The architecture of China and Japan is very different from that of Europe, and even in Europe itself the houses in the warm south are planned in some respects differently from those in the cold north.

The Bungalow.

When Europeans first settled in India they naturally modelled their dwellings after those of the inhabitants, and the "bungalow" came into general use. The derivation of this word is given us by Buchanan, writing in the year 1810. "The style of private edifices," he says, "that is proper and peculiar to Bengal consists of a hut with a pent roof, constructed of two sloping sides, which meet in a ridge. This kind of hut, it is said, from being peculiar to Bengal, is called by the natives 'Banggolo.' The edifice itself is more fully described by Hodges, who wrote thirty years earlier: "Bungalows are buildings in India, generally raised on a base of brick, one, two, or 3ft. from the ground, and consist of only one storey; the plan of them usually is a large room in the centre for an eating and sitting room, and rooms at each corner for sleeping; the whole is covered with one general thatch, which comes low to each side; the spaces between the angle rooms are viranders, or open porticoes." And, in sooth, they were comfortable. Their worst defect, perhaps, as the "Times of India" recently remarked, was the darkness of the centre rooms in rainy weather. With skylights let into the roof to remedy this, a well-built bungalow would be almost an ideal dwelling for a country like India. It does not readily get heated by the sun, the ample verandahs tone down the fierce glare, and the open doors and windows on all sides give free passage to the breeze.

The Change Effected by Towns.

Unfortunately this style of building is practicable only where land is of little value. As stations grow into towns it becomes imperative to economise space by building upper storeys. To meet this difficulty the people of India invented, or adopted, a plan which was in vogue in South Europe before the Christian era. The centre of the edifice was converted into an open courtyard, around which the rooms were arranged, with a running verandah all round on the inside. But it does not appear to have found favour in India. Perhaps by the time they began to require two-storeyed buildings they also had begun to despise things native; or, more probably, the architecture at that stage began to pass out of private guidance into that of a department, the heads of which had brought their ideas from Europe and were not compelled to live in the habitations which they contrived. However that may be, the bungalow began to be replaced by a style of edifice which, be it barrack, college, court or dwelling-house, is in its essential features the same. The external aspect may be Gothic, Saracenic, mediæval or *fin-de-siècle*; the floors may be cement, asphalt, mosaic, or almond cake of broken crockery; these are accidentals which do not effect the character of the building from the point of view of those who occupy it.

Hot Walls and Hot Rooms.

To them it is a massive stone pile, the walls of which, rising sheer from the ground to the roof like a rocky precipice, receive the fierce heat of the sun from dawn till noon on one side, and from noon till dusk on the other. They are usually fronted with broad verandahs, architecturally imposing from without; from within they are uninhabitable all the after part of the day, and help to heat the inner rooms by the radiation from their burning stone floors. This is sometimes remedied afterwards by fitting them with sunshades of striped canvas.

The imposing stone barracks which began thirty or forty years ago to take the place of the old thatched lines in which our European troops used to live probably cost at least ten times as much; but we believe that Tommy Atkins himself, if the choice had been offered him, would have elected to remain under his old thatch. The same thing is now happening in Marine Lines in Bombay. Some of the old bungalows were scarcely defensible. They were built on the level of the ground, or below it, and were dark and damp. But it is a question whether many of them were not more comfortable to live in than the massive piles which are slowly rising in their places at great cost. It is scarcely fair to blame the department which is erecting these, or the individual officers who compose it. A large department, like a loaded wagon, makes grooves as it goes, and allows no scope for the eccentricities of genius. A Government engineer who tried anything daringly novel would have to be relegated to the Sind Canals in the interests of good administration. The only hope lies in individual and irresponsible genius.

Ventilating Buildings in India.

Whilst dealing with this subject it is opportune to refer to an article on the "Ventilation of Buildings in India" which appeared in a recent issue of "Cassier's Magazine." The writer, Mr. John Wallace, C.E., remarks that house property in Bombay is an exceedingly popular investment among the wealthy natives; and as everyone of them seems to think that the possession of money brings with it a talent for designing dwellings, the buildings are mostly unsatisfactory both as regards the division of space and as regards ventilation, the latter being especially defective. Large and lofty rooms are now too expensive for any but the wealthiest people, on account of the high price of land; and blocks of buildings, which are now in fashion, have so much mass that they are properly ventilated only when a breeze is blowing. This amounts to saying that the air in them is often quite stagnant on account of the frequent periods of calm on an island whose mean annual wind velocity scarcely exceeds twelve miles an hour.

Most of the new houses have a fine show of windows on the outside, but no corresponding opening to allow a current of air to pass through. The mean annual temperature is 79·13° Fahr., and the mean relative humidity 77 per cent.

The Punkah.

As it is not possible to dry the air in an ordinary house, the usual remedy is to produce a current by means of a punkah; and although the influence of this is very local, it has been found that in the worst Bombay weather life is made tolerable in its current. The chief drawback of the punkah is the punkahwalla. Every year in the dry season camps are established in parks and open spaces about Bombay to accommodate an excess of population which finds life under canvas, with its many drawbacks, preferable to life in houses which are badly arranged and often unwholesome. Various projects have been discussed with a view to providing suitable houses for the European population, but nothing so far has come of them, and the need for wholesome houses is, if possible, greater than ever.

There is an excellent climate which is very near Bombay, measuring vertically. It lies within 100ft. of the surface, and is free from all the dust and smells that are too much in evidence at the ground level, and even at times in the third storey. Mr. Wallace suggests that this pure air should be drawn down into the houses by means of a fan on the roof.

EXPLORATION IN EGYPT.

THE GREAT DISCOVERIES.

THE fifteenth ordinary general meeting of the Egypt Exploration Fund was held on Thursday last at Burlington House. Sir John Evans, K.C.B., who presided, stated that the financial position of all three branches of the fund was most satisfactory. He went on to refer to the archæological survey for the year, mentioning that it had resulted in the production of two interesting volumes. There had been no expedition on the part of the survey either in 1900 or 1901; but in the ensuing season one would be undertaken, though its immediate destination had not been absolutely settled. During the past season the scene of the fund's operations had been, in the main, on the site of the Royal Tombs near Abydos.

Professor Petrie afterwards gave an address, in the course of which he said:—This year we have the satisfaction of completing the most important historical work that has yet come into our hands. The continuous order of seventeen kings has been established; and the very foundations of Egyptian history have been settled in a manner which had hitherto seemed entirely beyond hope. The royal cemetery of the tombs of the kings at Thebes, belonging to the eighteenth to nineteenth dynasties, and that of the Pyramid-Builders at Memphis, of the fourth to sixth dynasties, were the only series of royal tombs yet known; and neither of those had added anything to the history which was already fixed by other monuments.

But the recovery of the royal tombs of the earliest dynasties has given us not only another royal cemetery, but has provided the only contemporary history of their time, and completely vindicated the historical character of the lists which had been preserved by later ages. The criticism of myths had told us that Mena, the founder of the Egyptian monarchy, was but a form of Mena, the lawgiver of India, and of Minos, the hero of Crete; and to hope for tangible monuments of his time was but seeing castles in cloudland. Now the long line of a dozen kings back to Mena is clear before us; and even the kings which went before him are better known to us by actual objects than are half the Saxon kings of England. No such complete materialization of history has been obtained at one stroke from any other country or age. And such a result was least to be expected from ground which had been pronounced exhausted, the last clearance of which, unhappily, had just been made before our work there.

Altogether in the two volumes issued to you there are over 500 photographs, over 2,000 drawings and nearly 2,000 marks, beside the full and detailed plans and sections of the whole of the tombs. None of this mass of material, which alone has enabled us to restore the earliest dynasties, would ever have been known had we been content to leave the subject where the common routine of excavation had already abandoned it. You see before you on the largest scale an object-lesson on the futility and destructiveness of a mode of work which was no worse than the greater part of what has been perpetrated in Egypt in the name of excavations during the last hundred years.

Now there awaits us yet the great temple site of Abydos, the ground of the earliest temple, that of Osiris. It has been largely dug over for earth, and some monuments have been removed, but the lower levels of it are yet untouched.

HIGHWORTH PARISH CHURCH. DRAWN BY H. T. REES.

The site is a very large one, about 500ft. by 1,000ft., or three times the size of the whole of Trafalgar Square and its roads, and it will have to be turned over 12ft. deep. If we get a third of that, or as much as Trafalgar Square, turned over in the course of a season, that will be as much as one can expect, so that about three years will be occupied in exploring this great site. It is in that ground that we may hope to find tombs of the earliest historic time, and carvings in stone and ivory of the primitive kings, like those from Hierakonpolis.

No such opening of new fields to the mind has come to pass since the days when the Renaissance scholars burst into the world of lost classic authors; even the surprising unfolding of Assyria and Babylonia lacks the historic completion of the Egyptian record, and is still almost untouched in its archæology and development. Many a dim passage in the long course of the history yet awaits the light, and it will be the duty of the new century to fill in as far possible the details of the picture which has been sketched in the last few years.

CIVIL ENGINEERING.

MR. CHARLES HAWKSLEY delivered his presidential address last week to the Institution of Civil Engineers, of which his father, the late Mr. Thomas Hawksley, was president in 1872 and 1873.

He proceeded to give a rapid retrospect of the advances made during the nineteenth century in the more prominent branches of civil engineering.

As regards roads, he pointed out that, except for about 200 miles of good roads constructed by the blind road-maker, John Metcalf, in Lancashire and Yorkshire during the latter half of the eighteenth century, the roads in this country were in a deplorable condition at the beginning of last century, so that carriages often stuck fast in the ruts and travelling at a speed over six or seven miles an hour was almost impossible even on the main thoroughfares.

After touching on docks, lighthouses, naval architecture, mining, water-power and irrigation, Mr. Hawksley came to the history of water supply. Speaking of the regulation of fittings so as to be suitable for a constant supply, he said that formerly Parliament left the making of such regulations to the company or local authority entrusted with the supply of water, but of late years had unfortunately made them subject to the approval of a Government department which was possessed of no special knowledge in regard to distribution of water, and which, regardless of the experience of fifty years, persisted in so modifying the regulations submitted for their approval as to render them impracticable for the maintenance of a constant service. In regard to the quantity of water required for domestic purposes with a constant service, he remarked that, from statistics he recently collected, the quantity of water supplied for domestic and other non-metered purposes was, on the average of six towns supplied by companies and having a total population of 1,185,000 persons, 19 gals. per head per diem; while for ten towns supplied by public authorities, and having a total population of 3,961,000 persons, the average was 18¼ gals. He was unable to agree with those who held that all waterworks undertakings should be in the hands of public authorities. His experience taught him that where the local authority possessed the waterworks the streets committee complained that they had no sooner repaved a street than the water committee broke it open to lay a pipe; and the salaries in the finance department were raised because of the additional duties the officials had to perform. Should a company lag behind in its duty, there was the local authority at hand to urge it forward; but if the local authority was supine in the exercise of its duties there was no one to bring pressure, for the ratepayer was practically helpless.

Mr. Hawksley went on to speak of sewerage and sewage disposal, gasworks and electricity, mentioning in regard to the last that, although it was the youngest of the sciences, over £130,000,000 of capital had already been invested in this country alone in electrical undertakings.

The Early Engineers.

Summing up his impressions, Mr. Hawksley said that the more he learnt of those early engineers who practised in the latter half of the eighteenth and the first quarter of the nineteenth centuries, the greater became his astonishment at and admiration for the boldness of their designs and the success that attended their execution. Most of them were men of scanty education as the term was understood now, and had few, if any, precedents to guide them; yet in face of all difficulties, with no trained assistants to aid them, at a time when travelling was arduous, Brindley, Smeaton, Mylne, Rennie, Telford, and others, carried out works of which we might be proud at the present day, even with all our training and precedents, assistance and mechanical appliances. It might be well to recall that Brindley's early years were spent as an agricultural labourer,

NEW POLICE AND FIRE-BRIGADE STATION, CAMBRIDGE: THE WATCH COMMITTEE'S ROOM. JOHN MORLEY, ARCHITECT.

that Smeaton was a philosophical-instrument maker, Mylne an architect, Rennie a millwright and Telford a stone-mason.

Standard Sections of Iron and Steel.

In the latter part of his address Mr. Hawksley discussed the question of standardization. Most British civil engineers, he said, had probably suffered inconvenience, and their clients not unlikely loss, owing to the absence in Great Britain of standard sections of iron and steel. For example, the engineer, when designing a roof or bridge, having selected from the book of some well-known firm the sections of angle and T-iron best suited to his requirements, found the contractor asking to be allowed to substitute some other section, because the one chosen was out of stock, or was no longer rolled, or was required in such small quantity that the makers would not put in the rolls to produce it.

These difficulties had led to the adoption in Germany and America of standard sections, with great advantage to all concerned. The producer could cheapen the cost of production, being able to roll considerable quantities of any given section at one time and place in stock any surplus. The middleman (if any) could buy in the cheapest market and be certain of finding an outlet for his purchases. The buyer could be sure of obtaining the section he required with the least amount of delay and at the least cost.

For some time past the Council of the Institution had realised the disadvantages under which British manufacturers were placed by the lack of some acknowledged standards, and it therefore approached the Institutions of Mechanical Engineers and of Naval Architects, and the Iron and Steel Institute, with the result that the four societies formed a strong and influential committee to take up the subject. This committee sat for three days in June last, hearing evidence from all parts of the country and from those representing our colonies and dependencies, and this evidence was so unanimous as to the desirability of issuing standard sections and specifications that the Institution of Civil Engineers decided to adopt the committee's recommendation and proceed with the work forthwith.

The Four Committees.

The committee had been divided into four parts, to deal with (1) bridges and general construction (chairman, Sir Benjamin Baker), (2) railway rolling stock under-frames (chairman, Sir Douglas Fox), (3) rails (chairman, Sir J. Wolfe-Barry), and (4) ships (chairman, Mr. Archibald Denny).

These four committees were now engaged in standardizing the various sections used in their particular branches of industry. From the evidence laid before the committee it appeared that in America, where the American Society of Civil Engineers had issued standard sections for rails and standard specifications, the rolling-mill makers would in most cases only roll to those sections. Some instructive instances of the waste of time and money in this country for want of standard sections were laid before the committee. One instance must suffice—that of a section incorporated in a bridge for one of our colonies. Here the average cost of the material was £8 10s. a ton, but one of the sections specified was of such an odd size and the quantity of it was so small that it had to be made by a blacksmith at a cost of from £28 to £30 a ton. A striking case of the money wasted by unnecessary multiplication of the number of sections occurred recently, where the contractor endeavoured to obtain the sections specified for a certain bridge, but found that although they were contained in the price-list issued by the makers none were in stock, and delivery could not be given. The contractor, therefore, worked out a girder of equivalent strength, incorporating therein sections that could be readily obtained, and the saving on this one item was over £600. Germany had now sixty-seven various standardized sections, and America only forty-nine, while Britain had no standard section and used over 170 different ones. In electrical traction the need for standards of rails was being especially felt. It was recently shown that there were no fewer than seventy-one different sections of tram rails, many of the municipal engineers designing their own sections, which only differed slightly from those of their neighbours—just sufficiently to cause trouble and expense if one system ever became connected to the next. The American practice was to reduce the numbers of sections as much as possible, but this, Mr. Hawksley thought, was travelling too far in the opposite direction. Care must be taken to provide a considerable variety of sections in the first instance and to add to them from time to time as necessary. The chief disadvantage urged against standardization had been the tendency to cramp originality of design; and that this was not a groundless fear was shown by the refusal of American makers to roll anything outside their stock patterns.

After a vote of thanks had been proposed by Mr. Mansergh, and seconded by Sir Alexander Binnie, Mr. Hawksley presented the various medals and premiums awarded for papers read last year, and afterwards held a reception in the library.

CAMBRIDGE POLICE & FIRE STATION.

THE new police and fire-brigade station which has been erected in St. Andrew's Street, Cambridge, from the designs of Mr. John Morley, architect, of Cambridge, has a frontage of about 93ft., constructed of Weldon stone, with a depth of 150ft. The main entrance to the police station occupies a central position, and gives access to a lobby having an enquiry office 20ft. by 12ft. at one side, while close at hand is the charge room (20ft. by 18ft.) communicating with the cell corridor, thus allowing a prisoner to be taken to a cell immediately the charge has been recorded. Ten cells are provided, each 13ft. by 7ft.; they are warmed by hot-water apparatus, and in each there is an air flue connected with the main-trunk flue. The usual staff accommodation is provided, and between the chief constable's house, fronting Downing Place, and the new buildings is the drill yard, open at each end and covered by a glazed roof. Opposite the cells is a block having a parade-room on the ground floor, with lecture, recreation and mess rooms above. Of the various rooms in the building the Watch Committee's, illustrated on this page, is the best. It is oak panelled to a height of about 8ft., and the chimney-piece has a circular mirror in the centre. The room is 18ft. high and has an oak floor. The fire-brigade station measures 30ft. by 24ft., and provides accommodation for any equipment the town may require for its brigade. Messrs. Kerridge & Shaw were the contractors; their tender was a little over £15,000. We are enabled to use the accompanying illustrations through the courtesy of "The Cambridge Graphic."

New Patents.

These patents are open to opposition until December 16th.

1900.—**Knives for Brickmaking Machines.**—22,074. E. M. Tymm, 486, Stockport Road, Longsight, Manchester; and T. R. Slack, Cross Lane, Marple, Cheshire. In order to save expense and to facilitate renewal, the knife is made in two parts—a boss to fit on the shaft, and a blade dovetailed on to it.

Windows.—22,119. A. E. Wright, The Aviary, Ash Vale, Surrey. Sash lines and weights are replaced by a spiral spring at each side of the window. Normally, these keep the sashes closed. Devices are provided for holding them in an open position, and the parting beads are made removable to enable the sashes to be swung inwards.

1901.—**Parallel Rulers.**—2,870. R. W. W. Thom, 139, Dalkeith Road, Edinburgh. In the middle of the rulers a circular piece of glass or mica is mounted. This is centred, and angles or degrees are laid down from it on the rulers, the object being to enable the direction of lines and the size of angles to be determined with greater ease and accuracy.

The following specifications were published on Saturday last, and are open to opposition until December 23rd. The names in italics are those of communicators of inventions. A summary of the more important of them will be given next week.

1900.—16,301, Orr & McCulloch, down-draught ventilating cowl. 16,879, Griffin, wood-mitering and shaping machines. 18 355, Méaille, fireplace. 18,539, Dieterle, smoke-consuming firegrate. 19,097, Wait, fanlight openers. 20,272, Tenow & Flodström, lumber-elevating apparatus. 20,385, Huggins, self-closing seats, doors, &c. 21,139, Lowe & Line, joints for lead pipes. 21,591, Chavasse, domestic firegrates. 23,179, Pattison, T-squares.

1901.—932, Arnodin, counterbalanced and jointed suspension bridges. 1,331, Masbro' Foundry Co., Ltd., Harbershon & Boardman, domestic fireplaces. 5,910, Blanford, sash-fastenings. 7,734, Wheatley (*Roy*), cement foundations and landmarks. 10,143, FIREPROOF PLATE WALL CO, LTD., & SIDEBOTHAM, walls, ceilings, partitions, &c. 10,215, GOLDING & JAMES, casings for electric conductors on buildings. 15,402, FEYERABENDT, preserving and fireproofing wood. 15,732, SMITH & TRAVERS, radiators for buildings. 16,352, BIRKBECK (*J. H. Williams & Co.*), chain pipe-wrenches. 17,829, STONE & SIMKISS, skylights for corrugated iron roofing. 18,416, GRAY, covers of manholes or inspection chambers. 18,640, WILSON & WILSON, door-locks.

Correspondence.

Concrete Tanks.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, W.

SIR,—The following method of constructing a concrete tank may perhaps be of interest to some of your readers :—A round hole is dug, say 6ft. in diameter and 10ft. deep, and the bare earth is rendered with cement, the only bricks used being in the crown. These tanks can be constructed cheaply, they rarely fail, and they are durable. Some I know have been in use for sixty years.—Yours truly, JAMES PARTRIDGE.

Liverpool Cathedral: Newman's Gothic.

To the Editor of THE BUILDERS' JOURNAL.

MANCHESTER.

SIR,—The letter on p. 197 of your issue for October 30th, connecting the great names of Newman and Pugin with this subject, is of much interest. Cardinal Newman has elsewhere paid his high tribute to the Gothic style, and it should be noticed that in the letter now quoted he employs the term "detail" not in an architect's sense, but as referring to the arrangement and equipment of a building. As regards the broad question of style, a mind so acutely poised as his could scarcely have claimed the Chiesa Nuova, the Gesu, &c., at Rome as Christian architecture in any strict sense. The mere fact that they were erected for ecclesiastical uses does not confer upon them such a title any more than it does on the "tin tabernacle" of the present progressive day. And it is a curious practical commentary on his quoted letter that in his own church at Edgbaston (threatened, I fear, by the proposed memorial church) the sixteenth-century "Oratorian" style was not adopted, but an earlier development even than Gothic—a sort of Basilican Romanesque one might call it.—Yours truly, W. RANDOLPH.

Builders' Notes.

Mr. P. Purvey, builder, of Hayward's Heath, died recently at the age of sixty-five years.

Mr. William Carroll, builder and contractor, of Kingstown, Ireland, died recently at the age of fifty-six years.

Mr. W. Outlaw, of Diss, died recently at the age of seventy years. Deceased was for many years the estate builder and carpenter on the Brome and Oakley Estates, under the late Sir E. C. Kerrison.

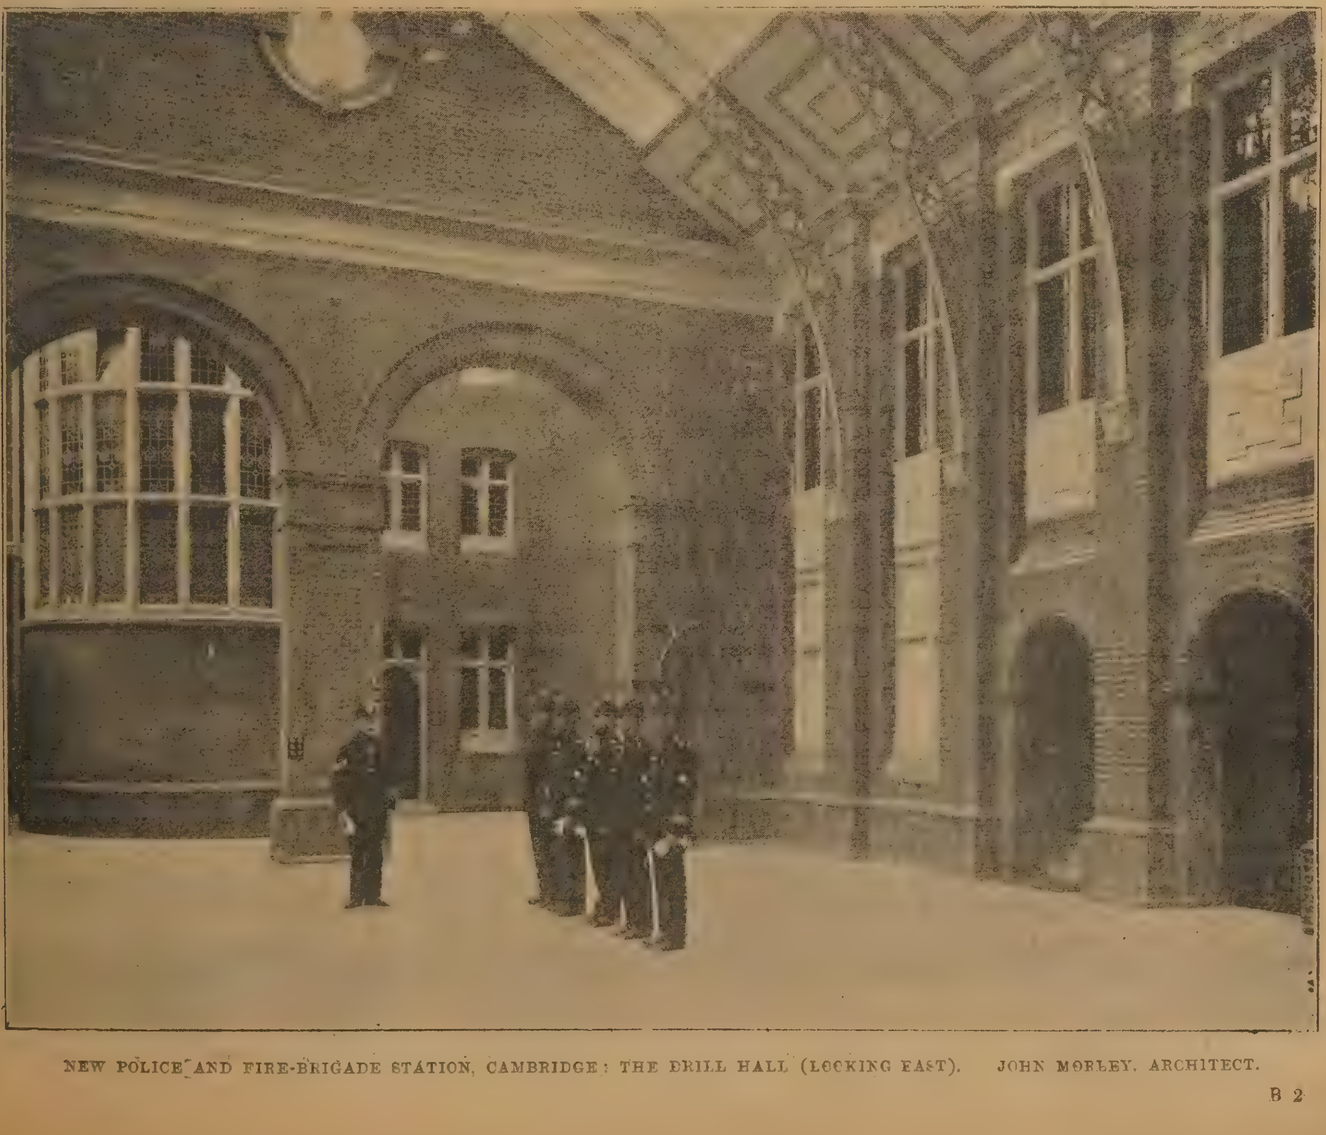
Mr. Anthony Lyons, builder and contractor, of Norton, Malton, sends us a booklet containing a portrait of himself and illustrations of buildings he has erected. This a new departure.

Fire at Builders' Premises.—Last Saturday week a serious outbreak of fire occurred on the premises of Messrs. Ross, builders, Claremont Road, Sparkbrook, Birmingham. A building consisting of two floors 100ft. by 25ft. was destroyed, and damage done to stacks of timber and sheds in an open yard and the backs of a row of houses. Messrs. Ross were not insured.

The Scottish Building Trades Federation held its seventh annual meeting of the Federation recently at Glasgow, when the following office-bearers for the ensuing year were appointed: President, Mr. Robert Lamb, builder, Edinburgh; vice-presidents, Messrs. Thomas C. Stocks, wright, Dundee, and John Morgan, wright, Aberdeen, together with eleven members of Executive in room of those retiring at this time; secretary, Mr. James L. Selkirk, C.A., Glasgow. The next half-yearly meeting of the Federation was appointed to be held in Perth, and the next meeting of Executive in Dumfries.

London County Council.—At last week's meeting the Water Committee recommended: "That a Bill be promoted by the Council in the session of 1902 for the purchase by the Council of the undertakings of the eight Metropolitan water companies, the Bill to be on similar lines to that of last session." Mr. R. A. Robinson moved the following amendment: "That, in view of the declared intention of the Government to introduce a Bill in the ensuing session for the creation of a water authority and the purchase of the water companies' undertakings, it is inexpedient for the Council to introduce a Bill dealing with the subject." A lengthy discussion followed, but eventually the amendment was rejected and the committee's recommendation adopted.

The Druidstone Riding School Collapse: Tie-Rods Misplaced.—In the course of the coroner's enquiry instituted into the circumstances connected with the deaths of a carpenter and a lad through the collapse of the Druidstone Riding School, Mr. A. Swash, architect, of Newport, stated that the accident was due to the tie-rods of the roof not being carried down to the base. There was no suggestion of scamped work, but the design was poorly conceived. There should have been more provision for wind-pressure. Mr. Conyers Kirby, architect, of Newport, opined that the lateral spreading of the outer posts caused the fall. Mr. Watkins, architect, of Cardiff, attributed the weakness to punched holes, as $3\frac{1}{2}$in. were taken from the $7\frac{1}{2}$in. The jury returned a verdict of "Accidental death," stating that the fall was due to constructive weakness by the tie-rod not being at the base of the roof-span.



NEW POLICE AND FIRE-BRIGADE STATION, CAMBRIDGE: THE DRILL HALL (LOOKING EAST). JOHN MORLEY, ARCHITECT.

OXFORD.

RESTORATIONS OF THE COLLEGES AND OTHER WORKS.

THE following particulars of works which have been or are being carried out at the colleges and other buildings in Oxford will doubtless be of considerable interest to our readers :—

Christ Church.

At the east side of Tom Tower restoration work has been in progress during the Long Vacation, the pinnacles, which terminate at about half the height of the building, being entirely renewed, and the decayed stonework in other parts replaced by new material. The work is being carried out by Messrs. Axtell & Butcher, under the direction of Mr. Bodley and at the cost of two members of the house.

New College.

The work of restoring the exterior of the chapel and dining-hall, which has now been carried on for the past three years, is approaching completion. A large amount of the stonework had fallen into decay, and where this has been removed Clipsham Down stone has been substituted, and the new carving has been executed in imitation of the old work, which dated in many instances from the time of the founder, William of Wykeham. The restoration is on a most complete scale and includes renovated buttresses, pinnacles, window tracery and labels, grotesque heads, cornices, parapets, &c. During the past twelve months the north transept of the ante-chapel, the north side of the chapel and dining-hall, and the east end of the hall have been dealt with, and a new turret has been placed on the west side of the north transept. A copper dowel has been fixed in each of the pinnacles and turrets, and the new stone is set in cement throughout. The architect is Mr. Basil Champneys, and the contractor, Mr. Bridgeman of Lichfield.

Merton College.

The canopies over the figure of St. John the Baptist at the north end of the chapel, on the outside, have been restored to their original design by the insertion of new fronts, pinnacles and finials complete. The tracery of the large window has also been partially restored, the whole being from the designs of Mr. T. G. Jackson, R.A.

Wadham College.

Among the works of restoration at this college are the pinnacles on the south end of the hall and the east side of the library, and the windows on the south side of the library, from the plans of Mr. T. G. Jackson.

Hertford College.

A considerable extension of this college has been commenced, a large space having been cleared at the corner of Broad Street and New College Street by the demolition of five houses. It is intended to provide twenty-four sets of rooms, and the structure, which will rise to a height of 50ft. at the ridge, will be of Gibraltar stone in the fronts, with Clipsham and Doulting stone dressings, and at the corner of Broad Street and New College Street there will be two oriel windows. The work of putting in the concrete foundations was begun a few weeks ago. The scheme of building will include, eventually, the whole of the site up to the Indian Institute and into Holywell Street, where several of the houses already belong to the college. The architect of the buildings is Mr. T. G. Jackson, R.A., and the clerk of the works is Mr. E. Long.

St. John's College.

The extension in St. Giles Street, which was in progress this time last year, is completed. The style is a replica of the rest of the college, and the accommodation afforded consists of six sets of undergaduates' rooms and a large lecture room. Mr. E. P. Warren, of Westminster, was the architect, the builders being Messrs. Benfield & Loxley.

The New Radcliffe Library.

This building, which is the munificent gift of the Worshipful Company of Drapers and cost about £20,000, is now completed. It is erected in the grounds of the University Museum, and will, it is believed, shelve 150,000 volumes, which, at the present rate, will allow of the development of the library for many years. The building was designed by Mr. T. G. Jackson, R.A., and the contractors were Messrs. Parnell & Son, Rugby. The heating was by Messrs. Haden & Son, and the fireproof construction by Messrs. Homan & Rodgers. An illustration of the exterior appeared in our issue for July 31st last.

Sheldonian Theatre.

The renovation of Robert Streater's beautiful allegorical painting on canvas, which forms the ceiling of the Sheldonian Theatre, has now been completed. The work was of the most delicate nature, the painting, which dates from the time of Charles I., having become cracked in thousands of places, while various portions of the canvas had become so rotten that it was found necessary to replace the disintegrated portions with new work. All the cracks in the painting have been filled by the operator with colour of hair-line fineness, and the old work has been thoroughly cleaned. The work of renovation was in the hands of Messrs. J. C. Nairn & Son, of Dublin, under the supervision of Professor Church, of the Royal Academy; Mr. Morrill of the National Gallery being responsible for the re-backing of the canvas.

St. Mary's Church.

At the University Church the paint on the stalls in the chancel and the panelling at the back has been cleaned off, and new flooring has been put under the stalls, together with new supports under the organ gallery, which were in a very bad state and were considered unsafe.

Morphological Laboratory.

This building, which is within the grounds of the University Museum, was commenced in July, 1898. It is now nearly completed. The architects are Messrs. J. J. Stevenson, F.S.A., and H. Redfern, the builders being Messrs. Symm & Co. The building contains on the top floor a laboratory, with desks for 100 students and the requisite convenience for carrying on the work, rooms for professors and for private investigation, storerooms for diagrams, &c., cloakrooms and lavatories for male and female students, and a well-lighted lecture theatre, accommodating 100 students, the entrance so arranged that it can be used by other lecturers without interfering with the work of the laboratory. The character of the architecture has been determined by the purposes of the building, which necessitated large windows of plate glass, giving uninterrupted light for microscopical work. The floors are of concrete, boarded over, as also the flat roof, with a covering of asphalt. The contractors for these were Messrs. Homan & Rodgers, and for the heating Messrs. Wantner, Smith & Co.

Radcliffe Observatory.

The tower which was begun last year for the reception of a new double telescope has been completed, and the work of thoroughly restoring the octagonal tower is now in progress. The stonework has become much decayed in places, and the restored portions include the carved capitals, the sculptures in relief (by Baron) on the frieze of the eight windows, and other parts of the structure.

Pathological Laboratory.

The plans for this building, which is also within the Museum ground, were prepared by Mr. J. Augustus Souttar, of London, E.C. The building, which was opened recently, consists of a partially sunk basement and two floors. Entering by the main door, access is given to a central hall from which, or from its gallery, all the rooms of the department open. Running up through both floors is a lecture room (25ft. sq. and 22ft. high) and a museum (31ft. by 25ft., and of a similar height), both being lighted from the north and east by roof-lights. Besides these, on the ground floor is a research-room for experimental pathology (25ft. by 18ft.), and another of similar size fitted up as a chemical research laboratory. On the first floor there is a room 43ft. by 18ft. for the teaching of pathological histology, and to this is attached a preparation room. There is also a classroom (31ft. by 18ft.) for practical bacteriology, a photographic room, and a demonstrator's room, &c. In the basement are a private laboratory, a dark laboratory, a large preparation room for the pathological and bacteriological work of the department, storeroom, room for heating apparatus, and workshop. The basement will also contain a refrigerating room 10ft. sq. and 8ft. high, kept below zero by one of Hall & Co.'s carbon-dioxide freezing apparata. The building is faced with Lawrence's red brick, with Bath stone dressings, and the roofs are covered with Broseley tiles. The contractors were Messrs. Symm & Co., and the cost was about £10,000.

New Board Schools.

During the year the School Board has erected three new schools, two of which, the Central Girls and Central Boys, were formerly opened on January 18th last. The third, known as East Oxford, was subsequently completed. Mr. Leonard Stokes was the architect. Other works which have been completed include an extension of the Eye Hospital (Mr. H. W. Moore, architect); the addition of new schoolrooms and a dormitory wing to Nazareth House (Mr. E. Goldie, of Kensington, architect); and a new Lloyd's bank at Carfax (Messrs. R. C. Davy and Stephen Salter, architects).

ILFORD MAIN DRAINAGE.

AT a meeting of the Society of Engineers held on November 4th, Mr. Charles Mason, president, in the chair, a paper was read on "The Main Drainage of Ilford" by Mr. Roger Gaskell Hetherington, M.A. The author first observed that the population of Ilford had increased by 35,000 during the last fifteen years, which necessitated considerable additions to the sewerage. The first drainage scheme was prepared by the late Mr. Brundel in 1882, when the population was only 7,500. The present scheme has been designed for a population of over 100,000 by Messrs. John Taylor, Sons & Santo Crimp, and the old system has been incorporated with it. The drainage area is such that one portion of it only can be drained by gravitation. The outfall works as first constructed became in time inadequate, and they were greatly enlarged in 1898, and the present system of dealing with the sewage was then started. This method consists of treating the crude sewage with milk of lime and ferrous sulphate and then passing it through settling tanks. From the settling tanks the effluent is taken into coke-breeze bacteria beds, and from thence to the River Roding, the sludge left in the tanks being pressed by sludge-pressing machinery. Owing to the works being required to deal with a considerably larger flow than that for which they were designed, the effluent has become unsatisfactory, and other modifications in the works are now being undertaken. The chief of these is the construction of an entirely new outfall to the River Thames. This effluent pipe will discharge into the Thames below the London Northern Outfall at Barking. As this outfall pipe, which is 30in. diameter, passes through a large tract of land lying below high-tide level, elaborate precautions have had to be taken to prevent tidal water being admitted to this low-lying land by any failure of the pipe. The scheme as a whole presents some interesting points as regards meeting the ever-recurring problem of treating the sewage of a district with a rapidly increasing population without discarding the existing system, which was never designed for great enlargement.

A New Branch Fire Station at Birmingham, intended mainly to serve the needs of Saltley and East Birmingham, is being erected at the corner of Lingard Street and Saltley Road. The builders are Messrs. Gowing & Ingram. The buildings, which are being erected from the designs of Mr. John Price, the city surveyor, are estimated to cost £7,500.

The Padiham Victoria Memorial Institute was opened recently in Burnley Road, and has cost £6,000 (including furnishing). Mr. Henry Ross, of Accrington, was the architect. The new building is of stone, and has a frontage of 88ft. and a depth of 130ft. The ground floor contains physical and chemical laboratories, lecture-theatre, weaving and manual instruction rooms, &c.; on the ground floor are classrooms, library, museum, &c., and on the first floor will be located the art-classes. The rooms are all lofty and well-ventilated. The building will provide accommodation for 400 students.

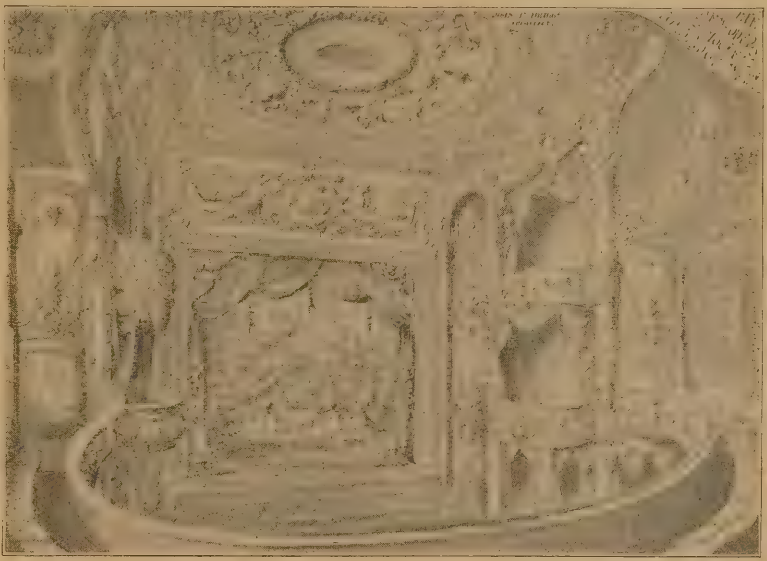
Bricks and Mortar.

APHORISM FOR THE WEEK.

"As an architect, therefore, you are modestly to measure your capacity of governing ornament. Remember, its essence—its being ornament at all—consists in its being governed."—RUSKIN ("Stones of Venice," Vol. I.).

Our Plates. THE chief condition imposed on the house at Oxted was to erect a three-storeyed building without a basement which was not to exceed 33ft. in height, and was to have a 10ft. ground storey: the whole, although erected on the summit of the Oxted hills, was to appear low. The site is unique, facing due south, and commanding views south and west over a vast stretch of country, and sheltered on the north and east by a fully grown copse. The south and west fronts are half-timber and pea beach rough-cast, and the north and east fronts are faced with hanging tiles. The hall and staircase, which form a separate wing, are made into an internal feature by lining the roof and gable with pitch-pine, V-jointed in narrow widths. The architect was Mr. Theodore Gregg, of St. Helen's Place, E.C.—The new opera house at Tunbridge Wells is now being erected. It is situated practically in the centre of the town, on a site lying between Calverley, Newton and Monson Roads. On this land some ten shops, premises for a bank, and eight warehouses also are to be built, and this property forms the basis of the financial undertaking, as the estimated rent-roll amounts to not less than £1,800 per annum, independently of any revenue from the theatre. The new buildings will cost over £30,000. The exterior of the opera house will present a massive and solid appearance. It is to be carried out in red bricks, with Bath-stone dressings, while the facade is to be in the Georgian style of architecture. Inside, everything will be effected with the idea of comfort and general convenience. There will be 120 orchestral stalls, 180 tip-up seats in the dress-circle, 170 pit stalls, 500 seats in the pit proper, and 300 seats in the upper of the two semi-circular galleries. Thus the total seating accommodation of the house will be 1,200. The proscenium opening will be 28ft. by 30ft., and the depth of the stage 38ft. by 50ft. In addition to the private boxes, the sides of the house immediately adjacent to the stage will be occupied by rows of ornamental pipes for the proposed organ, which is to cost £200. The decorations will be in Louis XIV. style.—St. Martin's Church is about to be erected upon a site that has been acquired by the trustees at Maxton, a suburb of Dover. The church will consist of nave, aisles and transepts, chancel, vestries for clergy and choir on the northern side of chancel, and main entrance on the southern, with organ-chamber over. At the west end of the church will be the baptistery and entrances. The building is to externally of red bricks, Portland stone weatherings to buttresses and copings and dressings to doorways and lower windows. The roof will be covered with green slates, and at the intersection of nave and transept roofs a ventilating flèche will be constructed. Internally the walls and arches will be of red bricks, the columns and springers of Bath stone. The roof will be formed over the nave, barrel-shaped, with moulded ribs, and the ceiling to the chancel will be centre-panelled. The nave floor is to be laid with wood blocks and the chancel with tiles. The seating to nave is to be of yellow deal, and the choir stalls of oak; the total seating accommodation is for 600 adults. The architects are Messrs. W. J. Jennings, F.S.I., & J. F. Duthoit, A.R.I.B.A., of Dover and Canterbury.

Queen Victoria Memorial. MR. SIDNEY R. J. SMITH, F.R.I.B.A, F.S.A., writing to the "Times," says: "On looking at the Victoria Memorial designs from a practical point of view (and I regret that this is necessary, for artistically the selected design is very satisfactory, though not perhaps quite what French art would do in a similar position and circumstance), it seems to me that in the event of a procession having to pass along the processional road all the chief features in the design would have to be cased up, and railings put on balustrades for safety of public, or the public entirely kept out of the processional road. This has more than ever impressed itself on my mind, for in walking down Piccadilly the other day every moulding, balustrade or foothold on which anyone can stand had to have a wood casing; and what would be the effect if a procession had to pass down the road shown on any of the designs (especially two of them)? I saw that it would be necessary to do a vast amount of casing, to put up temporary railings for safety, and employ quite an army of police to protect the 'architectural features,' which are in any case sure to be damaged."—Lord Grimthorpe suggests that a competent mathematician should "calculate from the published dimensions of this 'noble monument' (as it is called) how much its total bulk will exceed that of a small church-tower of the same height and a base 20ft. sq. And then the Government ought to stop its progress until there is created *in situ* a full-sized model, of either wood or brick plastered, for the public to look at. In no other way can they judge of such a structure as a lop-sided pyramid. He might also calculate its proportion to the bulk of 'the Great Pyramid,' of which the dimensions may be found in various books."—Mr. Howard Ince says that Mr. Webb's design involves the conversion into roadway of nearly an acre of the lake in St. James's Park, and of more than three acres of the Green Park. "No doubt the Committee is prepared to meet the enormous cost, probably at least two millions."



NEW OPERA HOUSE AT TUNBRIDGE WELLS. JOHN P. BRIGGS, ARCHITECT.

County Surveyors in Private Practice. A GENERAL MEETING of the Architectural Association of Ireland was held last week. Mr. T. E. Hoodlum presided. Mr. Anthony Scott, M.S.A., moved:—"That in the opinion of this meeting of the members of the Architectural Association of Ireland, the present system under which county surveyors of Irish counties are permitted to engage in private practice constitutes a serious grievance and injury to the members of the allied professions of architecture and engineering; and that our secretary be directed to send copies of this resolution to the Chief Secretary and the Parliamentary representatives for the city and county of Dublin." He pointed out that the county surveyors were paid salaries ranging from £500 to £1,000 a year, and had a great deal of official work to do. They were placed in an unfairly favoured position to secure private work. He considered that the present state of affairs was an injustice to private practitioners and to the ratepayers also, because the latter paid a salary which ought to secure to them the entire services of the county surveyors. Mr. Butler, in seconding the resolution, said it was monstrous that men drawing big salaries for official duties should scoop up the best part of the private practice that was available. He suggested that the Association should appoint a small committee to deal with the matter, and moved to add a clause to this effect to Mr. Scott's motion. After some discussion, the resolution thus amended was unanimously agreed to. Mr. Johnston Roberts, solicitor, read a paper on "Some Law Points Useful to Architects."

Birmingham Architectural Association. IN their report for the twenty-seventh session the Council announce a successful year's work. Two members and ten associates were added to the roll during the past year; and in order to broaden the basis of the Association a new order of membership has been formed for associated craftsmen. The travelling studentship was awarded to Mr. W. E. Carless. Several excellent sets of drawings were submitted, and the Council hope that the interest taken by the associate members in this competition will increase during the coming year. With reference to the class of design it is stated: "One cannot too strongly emphasise the importance of the study of old and good work as an aid to design; its value in educating the eye to understand and appreciate scale, good proportion and refined detail cannot be overestimated; and the difference in the work of students who have given time to such studies is particularly noticeable." During the past year two visits were paid to works in progress; one to the church of St. Agatha at Sparkbrook (of which Mr. Bidlake is the architect), and the other to Mr. Arthur Harrison's new offices at Sparkhill for the Yardley District Council.

Architectural Association of Ireland. AN exhibition of drawings prepared by members of the Association has recently been held in the rooms of the Royal Institute of the Architects of Ireland by the kind permission of the president and council of that body. The drawings consisted of the competitive works of members for the various prizes offered during the past session. Nine large sheets of measured drawings of St. Patrick's Cathedral, Dublin, by Mr. T. A. Rockett, won the Association Travelling Studentship. Another set of measured drawings were shown of Mellifont Abbey by Mr. A. C. Scott, of Drogheda. Seven sets of drawings were shown which had been prepared in competition for the prize offered by the Royal Institute of the Architects of Ireland for the best design for a technical school. Mr. Charles Powell secured this prize. Three sketches of the Campanile in the Quadrangle at Trinity College were on view, one by Mr. L. O'Callaghan taking the Beckett prize. The class drawings showed good progress.

A Bronze Statue of the late Daniel Owen, the Welsh novelist, was unveiled at Mold, Flintshire, recently. Mr. Goscombe John was the sculptor.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Drainage Connections from Adjoining Premises.

PERPLEXED writes: "A. holds premises on lease subject to a drainage connection from adjoining premises held on agreement by B. from the same landlord. A. covenants to pay his proportionate share of cleansing and repairing drain. The L.C.C. orders a sanitary inspector of drains on B.'s premises. The local sanitary inspector, who has sanctioned the alterations on B.'s premises of late years, now opens and finds the drains defective on A.'s premises, and compels the landlord by a magistrate's order to carry out his requirements, and make a new combined drainage for both premises. This is done after due notice has been given to A. of the summons and magistrate's order. The landlord will pay for all the new drainage on B.'s premises, but is he liable for the whole cost of it on A.'s, or can he recover from A. a proportionate part? Does the clause to repair and cleanse become inoperative, because the sanitary inspector orders an entirely new drain? A.'s lease has run nine years out of nineteen."

We consider you are liable for the partial cost of the reconstructed drainage, especially considering the length of the lease.

Cleaning Brickwork after Fire.

DERBY.—R. W. writes: "I am endeavouring to remove smoke and fire stains, caused by a fire, from the exterior of a factory constructed of red brick. Can you suggest anything better than clean water and a hard brush."

We do not think you will be able to remove the stains entirely. The usual plan is to rub or scrape the brickwork down to a clean face. A hard brush and water would be ineffective.

Conversion of Concentrated into Distributed Loads.

SOUTHPORT.—ACORN writes: "On p. 201 of your issue for October 30th, in the reply to 'Stock Sections' is there not some slight mistake?—for in finding the bending moments for the concentrated loads at the points of application, you give:—

(1) Under the 6-ton load = 7·3 (5) = 36·5ft. tons.
(2) „ „ 8 „ „ = 7·3 (5) = 8 – 6 (8) = 46·9ft. tons.

I cannot see anything to follow in the method marked (2), for in working back you give:—

Under the 6-ton load = 6·7 (7 + 8) – 8 (8) = 46·9.

How does method (2) equal 46·9?"

A misprint occurs in the answer to this question, namely, in the seventh line of the small type it should read "Under the 8-ton load = 7·3 (5 + 8) – 6 (8) = 46·9ft. tons." Querist has also a misquotation where he says "Under the 6-ton load = 6·7 (7 + 8) – 8 (8) = 46·9." This should be as given in the BUILDER'S JOURNAL, p. 201, "Under the 6-ton load = 6·7 (7 + 8) – 8 (8) = 36·5ft. tons." Perhaps he will now be able to follow the calculations.

HENRY ADAMS.

Ventilation of Art Gallery.

LONDON, S.E.—VIGORNIA writes: "I am designing a glass roof for an art gallery, and am showing the ventilation by means of casements hung at the bottom to fall inwards, as shown on the sketch (not reproduced). Will this be satisfactory, and if not, what would you suggest?"

Outlet ventilators should as a rule be as near as possible to the highest part of the ceiling, but those shown at base of curved roof and falling inside look as if they should be efficient. If other ventilators be added in the flat portion of the roof, they should be Boyle's extracting cowls with ornamental rose grating below.

HENRY ADAMS.

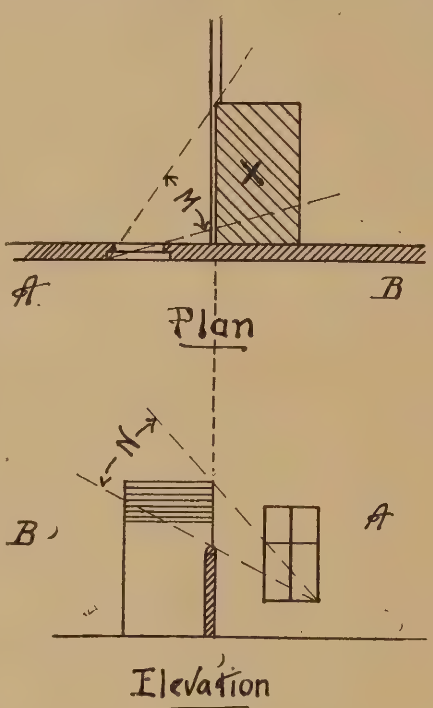
Strength of Bath Stone.

MALVERN.—X. Y. Z. writes: "I thank you for the reply on p. 201 of your issue for October 30th, but, considering the careful particulars given, I certainly expected a better reply. I anticipated a definite reply, not so many formulæ for calculation, or, at any rate, the formula worked out. Cannot Prof. Henry Adams give me something more definite than this? I am continually referring to the BUILDERS' JOURNAL, but really an answer like this is hardly worth writing for."

A correspondent replying in the way "X. Y. Z." has done hardly deserves further attention, but I may say that in the notes on p. 201 he was provided with the means of working out for himself by simple arithmetical calculations the particulars he required. He gave a careful and neat sketch of the arcade, but did not give the load to be carried by the columns or the nature of the foundations, so that the result could only have been approximately estimated by anyone else. HENRY ADAMS.

Ancient Lights.

WAVERLEY writes: "B. erects an one-story lean-to, as shown by the hatched portion X on the accompanying sketch. Can A. claim damage from B. in respect of right of light? If so, how would same be demonstrated on paper? Some contend that the obstruction must be immediately opposite the ancient light, and that a lateral erection like X is no infringement. The property has been erected for more than twenty years."



There would be obstruction, but only to a slight extent, the maximum being shown on illustration as within the angle M on plan and the angle N on elevation. If the mean obstruction were required (and it would be the more correct), these angles should be taken from the centre of the inside of the window sill. The loss of light would in this instance be so small that A. would probably obtain but small damage were he to bring an action, unless the windows were used for purposes requiring all available light. It would only be worth his while to act in order to prevent the creation of a precedent for further infringement of his right.

G. A. T. M.

Laundry Plant.

LONDON, S.W.—SANITAS writes: "Kindly give me an idea of the machinery and other necessary plant for the equipment of a small laundry in the country. The particular laundry in question is to serve a hospital of about twenty beds with a staff of six nurses, perhaps a total of thirty persons."

A complete reply to this enquiry would occupy too much of our space, but "Sanitas" can find the information he seeks by consulting Mr. John Taylor's book on "The Steam Laundry," published by Heywood & Co., Ltd., 150, Holborn, E.C.; price 7s. 6d.

Moment of Inertia.

NEWPORT, MON.—A. L. R. writes: "In the table on p. 73 of Messrs. Dorman, Long & Co.'s book of steel sections, a 9in. by 7in. girder is given of three different weights, and consequently of varying sectional areas; yet the vertical, or greatest, moment of inertia is stated to be 216·81, and the horizontal, or least, 46·59, for all three. I should be glad if you would thoroughly explain this, and state how the horizontal moment is obtained. Can you also name a good book showing how to find the centres of gravity of various shaped surfaces and bodies, and the best book on the 'Development of Surfaces'?"

The moment of inertia is explained on p. 14 of our issue for February 6th last, and in the article on building construction in this issue. We advise you also to consult Rankine's "Manual of Applied Mechanics," Rivington's "Building Construction, Vol. IV.," and Hurst's "Surveyors' Handbook." Lock's "Elementary Statics" explains how to find centres of gravity. The subject of the development of surfaces has not been comprehensively dealt with in any one book, but you will probably find all you require in the "Encyclopædia Britannica," J. F. Heather's "Practical Plane Geometry" and "Descriptive Geometry" (Crosby Lockwood), and E. W. Tarn's "Practical Geometry" (Crosby Lockwood).

Machine Joinery.

LONDON, S.E.—E. H. C. writes: "Please name a good book on machine joinery work in hard and soft woods."

We do not know of any book on machine joinery, nor do we think there is one. You should consult works on joinery, names of which can be obtained from Mr. B. T. Batsford's list of books. You should also consult manufacturers' circulars and catalogues.

Books on Architecture.

PUDSEY.—C. H. P. writes: "Who is the publisher and what is the price of the two books by Prof. T. Roger Smith?"

"Architecture, Classic and Early Christian," by T. Roger Smith and John Slater (5s.), and "Architecture, Gothic and Renaissance," by T. Roger Smith (5s.), are published by Messrs. Sampson Low, Marston & Co. Mr. B. T. Batsford publishes a list of standard books on architecture.

Brewery Chimneys.

F. W. writes: "Is there any book published on the building of brewery chimneys, with specifications?"

See "Breweries and Maltings, their arrangement, construction, machinery and plant," by G. Scamell, F.R.I.B.A., published by E. and F. N. Spon, price 12s. 6d.

Joints in Elliptical Arches.

HULL.—P. C. S. writes: "Which is the proper method of finding the joints in an elliptical arch?"

The joints should be normals to the curve, but as this necessitates different moulds for each voussoir the arch is usually struck from three centres, as this approximates to the true ellipse.

Books of Dimensions.

TIMPERLEY.—TEAK writes: "Is there any book dealing exclusively with dimensions of various parts of buildings and their fittings, such as heights of handrails, seats, lockrails of doors, &c.?"

Consult "The Principles of Architectural Planning," by Percy L. Marks (B. T. Batsford, 6s.) and "Specification" (5s.)

Air-Space Around Buildings.

STONE.—R. A. writes: "A plan was recently submitted to a local surveyor for approval. He has rejected it on on the ground that it contravenes by-law 54 (copy enclosed). Not being altogether satisfied with his explanation, I should be glad to know your interpretation of it."

The surveyor to the sanitary authority appears to be technically correct in his contention that the plan does not strictly comply with the by-law in question (relating to air-space about buildings, &c.), but it is probable that a slight rearrangement of the new buildings in their relation to the existing dwelling-houses would meet the local requirements. Engineering Notes.

The Institution of Junior Engineers held its inaugural meeting recently. Sir Lowthian Bell, F.R.S., the retiring president, occupied the chair during the first part of the proceedings, and announced that the Northcott prize had been awarded to Mr. William Powrie for his paper on "The Mutual Relations of Employers and Employed," and the Institution premium to Mr. Samuel Cutler, jun., for his paper on "Carburetted Water Gas." Sir John Jackson, his successor, then took the chair, and delivered his presidential address.

Hackney Electric Lighting Scheme.—Extensive works for the Hackney Borough Council in Millfields Road, Lower Clapton, for providing the district with electricity, have been opened. The site has cost £8,000, and the whole block, including a chimney shaft 200ft. high, is estimated to cost £277,000. The buildings have a frontage to the River Lea. The system under which electrical energy is supplied may be described as a low-pressure continuous-current direct-supply at constant pressure, on the three wire method. Mains have already been laid in twenty-five miles of streets, which represents about 118 miles of cable. The prices for electricity are for private lighting 4d. per unit, and for motive power 2d. per unit. A "free" wiring system has been adopted. A feature of the scheme is the utilization of refuse for the production of energy. When the entire scheme is completed the refuse will be put into the destructor, which consists of twelve furnace cells, capable of burning 160 tons of refuse in twenty-four hours, and it will be burnt at a high temperature with the assistance of a powerful fan blast. The gases given off will supply a large amount of heat energy, which will be utilized for the purpose of raising steam in three water-tube boilers. Arrangements are made for the automatic handling of the refuse, so far as that is possible, from the moment it is tipped at the works to the time when it emerges from the furnace in the form of clinker. Mr. Robert Hammond was the consulting engineer.

A New Bridge at Chatham is being erected over Railway Street in place of the old brick arch, which had existed for over 120 years, but had a width of roadway under the central arch of 18ft., with 4ft. 6in. piers, and openings for footpaths 6ft. on either side—total width over all, 39ft., the minimum clear headway at the centre of the roadway being 17ft. 3in. to the crown of the arch; the width of bridge over all being 23ft., with a clear width of bridge between parapets in New Road over the brick arches of 20ft. In the new bridge a clear headway of 17ft. 4½in. will be provided continuously across the roadway; and allowing 29ft. 6in. for roadway and 7ft. 4½in. for each footway, a width of 44ft. 3in. running east and west will be provided. Upon the upper surface of the new bridge a width of 45ft. will be provided running north and south, giving a carriage way of 30ft. wide and two footways each 7ft. 6in. wide. The new bridge and its approaches are being executed to the design of Mr. Arthur T. Walmisley, M.Inst.C.E., of Westminster, and include a fire station having an area of about 2,250 super. ft., fitted up with engine-room, fire escape, manual, hose cart, &c.; a drill-hall and office upon the west side of the bridge; and a public sanitary convenience, with an area of about 675 sup. ft. upon the east side of the bridge. There will be about 200 tons of steel in the construction, supplied and fixed by Messrs. E. C. & J. Keay, of James' Street Bridge Works, Darlaston (offices, Corporation Street, Birmingham). The remainder of the work is being executed by the Corporation's own workmen, under the supervision of Mr. Charles Day, the borough engineer; Mr. Arthur Horrox acting as clerk of works. The roadways hitherto had varying gradients. The west portion of the approach will have a gradient of about 1 in 40·3 for a length of about 277ft., then a level roadway for a length of about 57ft. across the bridge, and then joining the existing road upon the east side a gradient of approximately 1 in 35. An ornamental cast-iron handrail will form the parapet of the approach, south side; while that on the north side will consist of a brick wall.

FIRE-TESTS.

THE British Fire Prevention Committee have just issued the following four reports:—

Publication No. 61 refers to a 2½ hours' test made with a floor of steel joists and coke-breeze concrete, the lower flange being protected. Similar floors are frequently used by the London County Council in their buildings. The floor measured 10ft. by 7ft. 3in. and had two 7 by 3½ steel joists weighing 16lbs. per ft. run, spaced at 3ft. 4in. centres. The concrete consisted of coke-breeze and Portland cement in the proportion of 5 and 1, and was 9in. thick. Six weeks (spring) were allowed for construction and drying. There was no load on the floor. The following is a summary of the effect of the fire, the temperature of which ranged from 500 deg. to 2,300 deg. Fahr:—After 12 minutes plastering began to fall from the soffit, but beyond this no other effect was observed during the test. The fire did not pass through the floor. On the application of water the soffit of the concrete, where struck by it, was disintegrated for about ¾in., otherwise it remained sound.

Publication No. 62 refers to a test with a wood floor and ceiling protected by an additional suspended ceiling made by Banks' Fireproof Construction Syndicate, Ltd., of London. The test lasted an hour and a half, the temperature gradually rising to 2,000 deg. Fahr., followed by the application of water for two minutes from below. The following is a summary of the effect:—In 3 minutes portions of the setting coat of the suspended ceiling began to fall, and continued to fall throughout the test. When water was applied a portion of the floating coat was washed away, exposing the helical metal lathing. No fire was observed to have passed through the floor. Twenty minutes *after* the test was over the wood floor caught fire, and was extinguished. Two days later the floor boards were removed and it was found that the wood laths to a portion of the ceiling in the centre, for about 1yd. super., had been consumed, the under side of the wood joists was charred, and the ceiling had fallen away. The rest of the plastering and joists were sound, and the general stability of the floor unaffected.

Publication No. 53 refers to a test with a "Cunnah-Wright" partition erected by the Fireproof Partition Syndicate, Ltd., of London. The test lasted one hour and a quarter, the temperature rising from 500 degs. to 2,000 degs. Fahr, followed by the application of water for two minutes on the fire side. The area of the partition was about 80ft. super., with a width of 10ft., and four weeks (winter) were allowed for construction and drying. The following is a summary of the effect:—Hair cracks, from which the steam escaped, appeared from time to time on the passage side of the partition. The temperature on the outside face during the latter part of the test was too hot to bear the hand and paper held against it was scorched. The fire did not pass through the partition, which however fell bodily inwards when water was applied to the fire side. The makers have applied for a further test with a partition, and will allow a longer time for construction and drying, though the test will be limited to one hour.

Publication No. 58 refers to a test with a suspended partition also erected by the Fireproof Partition Syndicate, Ltd. The partition had dovetail corrugations 1⅝in. by ⅞in., and after being plastered measured 3¼in. thick, the plaster on the inside being ¼in. thicker than that on the outside. The test lasted one hour, the temperature rising to 2,000 degs. Fahr., followed by the application of water for two minutes. The following is a summary of the effect: The iron framework and steel sheeting forming the partition were found to be intact after the test, but two of the studs were bulged, and a small portion of the steel sheeting was burnt through and perished next to the centre stud. The temperature outside the partition next the passage was not sufficient at any time during the test to affect the recording points of the pyrometer, but the hanging thermometer on the face of the partition registered 200 degs. Fahr. in 55 minutes. Most of the plaster inside the chamber fell during the test, and the remainder was disintegrated, bulged, and ready to fall.

Law Cases.

Workmen's Compensation: "Average Weekly Earnings."—The case of *Ayres* v. *Buckeridge* came before the Court of Appeal on Wednesday last. This was an appeal from a decision of the judge of the Brentford County Court in an arbitration under the Workmen's Compensation Act, 1897. The applicant for compensation was the widow of Francis Ayres, a labourer, who sustained fatal injuries through an accident while assisting to demolish a building at Ealing. He was at the time in work at Whitechapel, and the question arose what rate of wages would be remunerative to him, taking into account the fact that he would have to travel to his work. In the result it was arranged that he should be employed for eleven hours a day for five days in the week and for five hours a day on Saturday, making altogether sixty hours a week, and that he should receive payment at the rate of 7½d. per hour. He was not employed for any specified number of weeks, and he was liable to be discharged from the employment at an hour's notice. It was stated that an ordinary workman in the position of the deceased would probably be employed from forty to fifty hours a week. The deceased did, in fact, work in his employment for four days, including the day on which he met with the fatal accident, and he worked for eleven hours on each of the four days. The county court judge made an award in favour of the applicant for £292 10s. He calculated this sum on the basis that this was the amount which the deceased would have earned if he had been employed for sixty hours a week at the rate of 7½d. an hour for a period of three years. The employer appealed, and it was argued on his behalf that the amount of compensation ought to be based on the amount of wages in fact received by the deceased during the time that he was actually employed. The period of his actual employment was forty-four hours in the first week of the employment. Wages at 7½d. an hour for forty-four hours amounted to £1 7s. 6d. On this basis the award ought to have been for £214 10s. The arguments in the case having been heard, the Master of the Rolls said the next two cases in the list—*Wheale* v. *Rhymney Iron Co., Ltd.*, and *Jones* v. *the Same*—he believed raised the same point. The two appeals were then argued, after which the Master of the Rolls gave judgment. He came to the conclusion that where a man was not in the same employment for two weeks or more the words in the Act, "average weekly earnings during the period of his actual employment under the said employer," must be treated as not applying to such a case at all. Where you had employment for more than two weeks the Act was clear enough, but where you had not the Act was silent. Then the county court judge must assess the award on the hypothetical basis of what the man's average weekly earnings in that employment would have been—that was a question of evidence, a question of fact for the judge of first instance to decide. Unless, therefore, it could be shown that the judge had misdirected himself, his ruling could not be interfered with by this court on the question of amount. The award made in each case would therefore stand, and the respective appeals dismissed with costs. The Lord Justices concurred.

The "Tube" and Smoke Nuisances.—At West London last week a batch of summonses came on for hearing against the Central London Railway Company in respect of the alleged annoyance caused by the issuing of black smoke from the two shafts at the electrical generating station in Wood Lane, Shepherd's Bush. Mr. Horace Avory said the company were in a predicament which deserved the sympathy of the Court. It was true that a Welsh coal was used in September, but on the 2nd of that month the whole of the service of trains was stopped, as it was found impossible to keep up the necessary quantity of steam, and they felt bound to revert to the use of the old kind of coal to keep up the quantity of steam. He suggested an adjournment to allow the company to test the power of the new boilers which they were engaged in substituting for the present appliances. Mr. Lane, K.C., said he was disposed to close the case by imposing moderate fines, but he should deal with it differently if it came before him again. He imposed penalties amounting to £10, with twenty guineas costs.

Roadmaking and the Workmen's Compensation Act.—On Saturday last in the Court of Appeal the case of *Ellison* v. *Longden & Son* was heard. This was an appeal from the Sheffield County Court in an arbitration under the Workmen's Compensation Act, 1897. The applicant for compensation was a workmen who was injured while blasting large boulders of stone on Loxley Common for the purpose of making a road. The explosion took place about 6yds. from the mouth of a tunnel running into the side of a hill. The Court dismissed the appeal. The Master of the Rolls thought the county court judge had abundant evidence to justify him in finding that the applicant was employed on or in or about a mine within the meaning of section 7, sub-section 1, of the Act. The Lords Justices delivered judgment to the same effect.

Architects as Arbitrators: Important Case.—The case of *Belcher and Another* v. *the Roedean School Site and Buildings, Ltd., and Another* came before the Court of Appeal on November 4th. Mr. Ralph Neville, K.C., said that the company was established for the purpose of erecting buildings for a well-known school at Brighton, and the respondents on the appeal were a Mr. Belcher and also the trustee in bankruptcy of the contractors who had contracted to do some of the brickwork in the erection of the school. The appeal was from a decision of Mr. Justice Laurance revoking the submission to the architect in the builder's contract. The learned judge revoked the submission altogether on the ground, as he (counsel) understood it, that there was litigation pending between the architect and Mr. Belcher. The contract price was £48,589. Mr. J. W. Simpson was the architect. Clause 4 of the contract provided that the works must be completed to the architect's satisfaction on or before September 1st, 1898, provision being made for penalties for delay. Clause 16 provided for the payment of the contract price by instalments upon the architect's certificate, and provision was also made for the determination of the contract in the case of the bankruptcy of the contractors, &c. Clause 26 provided for a full reference to the architect of all disputes and matters which might arise between the building owners and the builders. Counsel went on to state that on September 1st, 1898, the buildings were very far from completion, and the builders being at that time very short of funds loans were made to them by Mr. Belcher and other people on the credit of the contract. Notice was given of these advances, and the lenders got a charge on the builder's contract. On January 27th, 1899, the architect gave the contractors notice to proceed with the work under the 20th clause of the contract, and on their failure to proceed according to his satisfaction, on February 1st, 1899, the building owners served notice to determine the contract On the same day a petition in bankruptcy was presented by the contractors, which was followed by a receiving order. Then the work was taken over in accordance with the terms of the contract by the building owners, and completed under the inspection of the architect; and on June 27th, 1901, the architect issued his final certificate, which showed a balance due to the contractors, above the amounts paid to them, of £350 13s. 5d. This was sent to the trustee in bankruptcy of the contractors, accompanied by a statement of accounts by the Roedean School Site and Buildings, Ltd., in which they showed that in consequence of the non-completion of the works in accordance with the contract there was a balance due to the company of £1,255 7s. 5d., after deducting the £350 18s. 5d. due to the contractors on the architect's final certificate. On July 6th, 1901, the solicitors to the company wrote to Mr. Simpson asking him to make an appointment as arbitrator under the contract, but both Mr. Belcher and the trustee refused to acquiesce in the reference to Mr. Simpson. On July 23rd the arbitrator held a sitting, but as only the company appeared he adjourned it. On the same day Mr. Belcher issued a writ against Mr. Simpson, the architect, claiming damages for misrepresentation on the ground that Mr. Simpson had given him wrong information when he (Belcher) called upon him in order to see if he might safely advance money to the contractors. A summons was then taken out before the judge for an injunction to prevent the arbitration proceeding, and this was granted, and at the same time the submission to arbitration was revoked. Mr. Neville submitted that the action against Mr. Simpson was launched for the purpose of bringing the case within the decision of *Baring* v. *Dowlton & Co.*, and so preventing the architect from acting as arbitrator. Mr. Bray, for the respondents, submitted that the action against Simpson was a bona-fide one, and that the order below should not be disturbed. Their Lordships held that there was no ground for removing the architect from his position as arbitrator, and reinstated him in his position. The appeal was accordingly allowed, with costs.

HOGARTH'S HOUSE, CHISWICK.

The Workmen's Compensation Act and the Demolition of Old Buildings.—In the Court of Appeal on Thursday last, the case of *Knight* v. *Cubitt & Co.* was heard. This was an appeal by the employers, Messrs. Cubitt & Co., from the decision of the judge of the Brompton County Court in an arbitration under the Workmen's Compensation Act, 1897. The applicant for compensation was the widow of a man who was killed in the course of his employment. Messrs. Cubitt & Co., who were builders, had entered into a contract with Messrs. Woolland to alter two houses, Nos. 16 and 17, William Street, Knightsbridge, and for this purpose No. 17 had to be demolished and rebuilt. Messrs. Cubitt & Co. entered into a sub-contract with one Clements, called a housebreaker, whereby the latter undertook the demolition of the house. The deceased man was in the employment of Clements, and while he was employed on the demolition of the building he was killed by an accident. The building was originally over 30ft. in height, but at the time of the accident had been reduced to about 11ft. in height. The party-wall between Nos. 16 and 17, however, remained standing, and it exceeded 30ft. in height. The county court judge made an award in favour of the applicant for £273. It was contended first that the work of demolition was merely ancillary to, and was no part of or process in, the trade or business carried on by Messrs. Cubitt & Co. within the exception in section 4 of the Workmen's Compensation Act, 1897. Secondly, the employment at the time of the accident was not on a building exceeding 30ft. in height; and thirdly, Messrs. Cubitt & Co. were not "undertakers" within the meaning of the Act. The Court dismissed the appeal. The Master of the Rolls said that with regard to the question whether the building exceeded 30ft. in height there was a finding of the county court judge that the building was over 30ft. in height at the time of the accident. His Lordship did not impugn anything decided in *Billings* v. *Holloway* (1899, 1 Q.B., 70). The finding in the present case stood quite independent of that case. All the Court had to do was to see if there was any evidence upon which the judge might reasonably find that the building exceeded 30ft. in height. The evidence showed that the workman was at the time of the accident employed on a building, a substantial part of which, namely, the party-wall, was over 30ft. in height. Therefore, there was evidence to support the finding. Upon that point the appeal failed. With regard to the other points raised, the evidence showed that it was part of Messrs. Cubitt & Co.'s business to demolish buildings, though for their own convenience they did not actually do the work of demolition themselves, but employed a skilled man, called a housebreaker, to do it. They contracted to demolish this building and to reconstruct it. They undertook both obligations, and that was their usual course of business. Therefore, upon the facts, there was nothing to exclude Messrs. Cubitt & Co. from the position of "undertakers." This particular question arose under section 4 of the Act, that section dealing with undertakers who *ex hypothesi* had deputed to another the carrying out of something which they themselves had contracted to do. The Lords Justices delivered judgment to the same effect.

Workmen's Compensation: Another Important Appeal Case.—The workmen's compensation case of *Christopher McGrath* v. *Robert Neill & Sons* came before the Court of Appeal on Friday last. The appeal was from the Manchester County Court. The question was, in measuring the height of a building for the purpose of deciding the claim to compensation, should the measurement be taken from the street level, the basement level, or the footing below the soil. The top of the walls of the warehouse which Messrs. R. Neill & Sons were building measured at the time of the accident, from the bottom of the footing, exactly 33ft. 2½in.; from the top of the footing, 31ft. 2½in.; from the basement floor, 29ft. 10in.; and from the level of the street, 23ft. 5¾in. If the two last measurements were taken, the statutory height would not have been reached, and Messrs. Neill & Sons appealed on the ground that the standard of measurement should be taken either from the basement floor or the level of the street. The Court dismissed the appeal. In their opinion there was evidence that the warehouse was a building exceeding 30ft. The learned county court judge had measured the height from the bottom of the footing; and while they did not decide the point, for it was unnecessary to do so here, they intimated that for the purposes of the Act they saw no reason why the measurement might not be taken to commence even from the level of the foundations of the building.

Hogarth's House, Chiswick, is to be offered for sale at the Mart on November 25th. A scheme is on foot to purchase it and turn it into a museum of relics of the great painter. The accompanying illustration is therefore of much topical interest.

BUILDING CONSTRUCTION.

(*Continued from p.* 221, *No.* 352.)

Beams.

29. IN text-books of mechanics tables of beams under various modes of loading are usually given. Some books give six different modes and some give twelve. We shall consider these different cases later. In all of these modes of loading the loads are supposed to give no self-support. In practice, however, the self supporting value of the loads is often of very great importance, and it would be very inconvenient to extend the table to include them all. If a student proposes to depend upon his memory for the formulæ in connection with these different beams and loads, I strongly advise him against such a course. For the comparatively rough-and-ready purposes of practice, it is not necessary to follow too closely the refined physical and mathematical investigations which have connected themselves with this subject, and which are exceedingly interesting and valuable; and the student will find it profitable and pleasant to consider the subject of beams in a general form.

30. Consider a portion of a Warren girder to the left of a line $\alpha\beta$ in equilibrium under the forces figured and the stresses at $\alpha\beta$ (Fig. 38). The diagram of stresses shows that the stress in jk is a compression of 2,910lbs., and that the stress at β is compounded of the stress 2,525lb. in ai and the stress 825lbs. in ij. If we increase the number of bracings (Fig. 39) we get the same stress in the member of the upper cord next α, and a little more in the member of the lower cord next β; and if we divide the *distributed load* on the top of the girder still more, we can make the stresses in the top and bottom cords as nearly equal as ever we please, and the stress in the member of the bracing next $\alpha\beta$ ultimately becomes (1000 – 300) lbs. It will be observed that the average stresses on the bracings remain nearly the same, however many there are of them, and that they are alternately + and –, compression and tension. If we make them very numerous we shall add to the weight of the girder without increasing its strength in any way, and, further, the limit will soon be reached at which it is no longer possible to mechanically construct the girder – there will not be room for the joints. We may, however, imagine the bracing members increased till they stand in contact from cord to cord, and that when this limit is reached any slight straining motion will cause the tension members to rub against the compression members. Go a step further: suppose the joints between each tension member and compression member to be made fast with some cementing material, the stresses in the bars neutralise each other, but there is a stress of a peculiar kind put upon the cementing material which now prevents the bars from *sliding against* one another; it is now a very slight further step to take to imagine the cementing material and the material of the bars to be the same, and we have the condition of a flange girder, where the top flange is the top cord, the bottom flange the bottom cord, and the web is the adhering bracing. The stress upon the assumed cementing material is the *shearing stress* or *shear*. The student will see that this is the kind of stress put upon the neck of a rivet in the plating of a boiler and on the shanks of bolts and rivets in analogous positions; he will understand what is meant when it is said that the *web takes the shear*. As a matter of fact, in an ordinary **I** rolled joist the flanges also take some of the shear, as the student ought easily to see from what I have said above.

31. Replace the girder, Fig. 39, with the rolled joist (**I** section), Fig. 41. It has been seen that the shear at $\alpha\beta = 700$lbs.; and if we assure ourselves that the *section* is sufficiently strong to bear this stress, we need not further trouble about it. The stresses in the flanges may be found by a diagram (Fig. 40) for which any kind of bracing is assumed—gathering the load to the apices: it will be the stress corresponding to the line J K (Fig. 38). But the simplest plan is to take moments about the point β

$$1000 \times 5 - 300 \times \frac{5}{2} = \text{the moment about } \beta;$$

this is the *bending moment* of the beam at the section $\alpha\beta$ Divide this by the depth of the beam for the compression stress on the top flange; the tension stress on the bottom flange is equal to it. It is commonly assumed that the bending moment is resisted by the moment of the couple formed by the stresses in the flanges and having for arm the line joining the centres

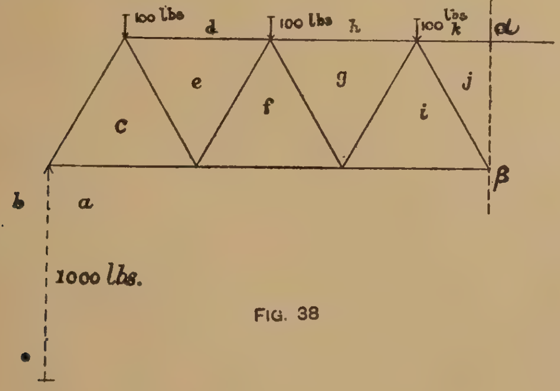

FIG. 38

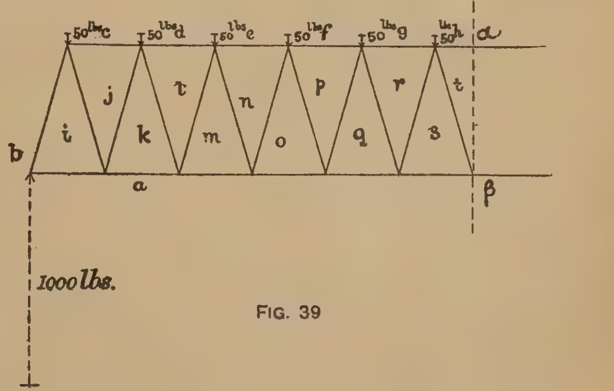

FIG. 39

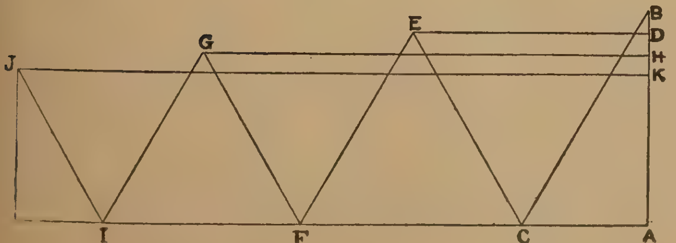

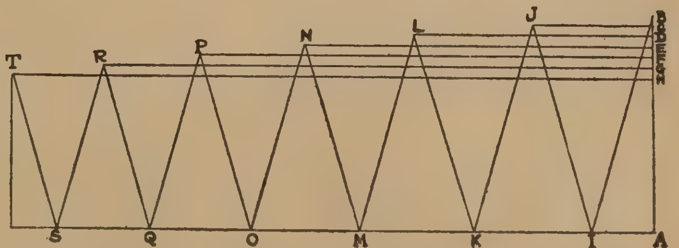

of gravity of the cross-sections of the flanges; just as we have seen that the flanges take some of the shear, the web also takes some of the bending moment.

32. The portion of girder shown in Fig. 41 may be a part of a girder loaded uniformly and supported at the two ends, like that of Fig. 42, carrying a uniformly-distributed load of 2,000 lbs. It may be inferred from Fig. 38 that as the cross-section $\alpha\ \beta$ is taken nearer the middle of the girder the bending moment gets greater, and it is a maximum at the centre of the girder; on the other hand, the shear gets less and less and it becomes nought at the middle point of the length of the girder. Examine the stress diagram: the horizontal lines are separated by the equal distances B D, D H, &c., but the differences between E D, G H, J K, &c., are not equal, and consequently the line joining B E G J, &c., is not a straight line; it will be found that a curve will fit these points, and that it is a curve of a known kind. It is a parabola having for its axis O A (Fig. 40) where O A is the maximum horizontal stress on either side of the *neutral axis* at the centre of the girder, and having for its ordinate at A, A B the maximum shear which is at the point of support. This is a very useful form; the girder being of uniform depth, the bending moments are proportional to these stresses. If the ordinate B A be taken to represent half of the girder, a horizontal line from any point to meet the curve gives the stress in a flange at that point; the ordinate from this point to O A gives the shear at the point, and the bending moment is given by multiplying by the effective depth of the girder.

In the case of rolled joists there is no great use for this curve, because the joist is rolled of uniform cross-section, and we have simply to see that the section is sufficient for the maximum bending moment and for the maximum shear.

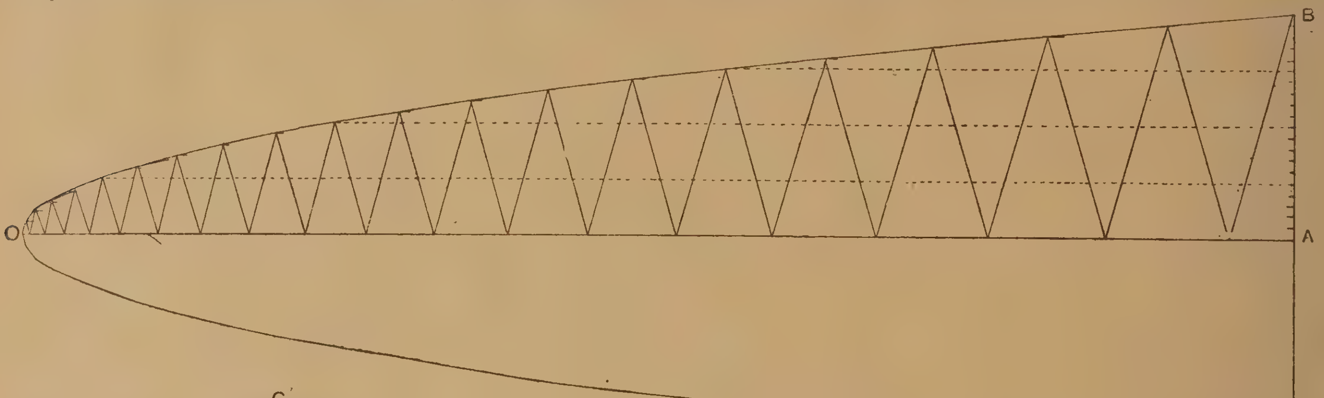

FIG. 40

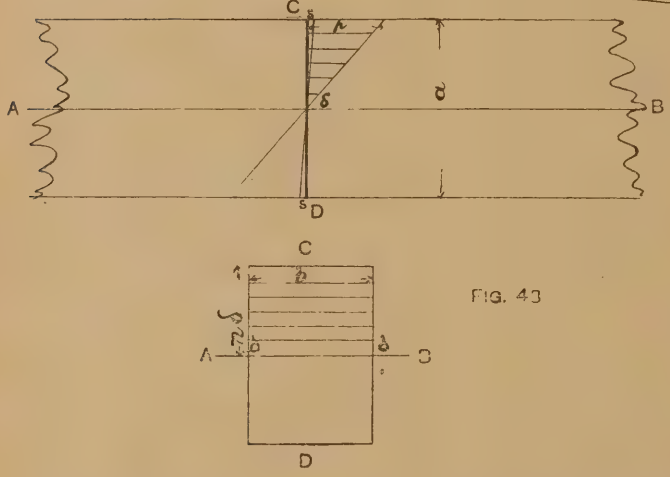

FIG. 43

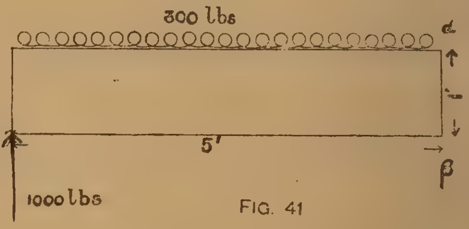

FIG. 41

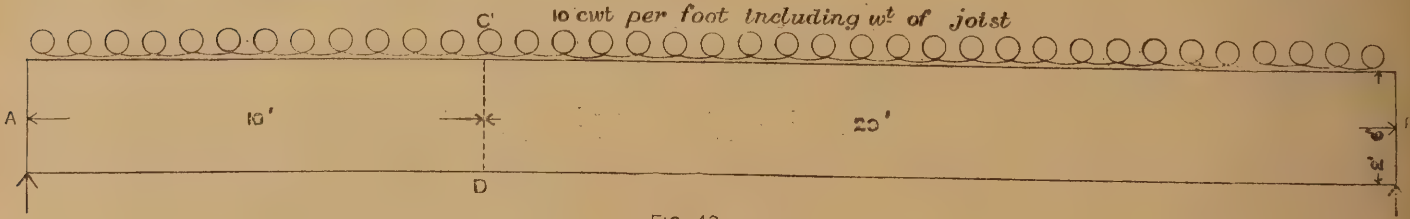

FIG 42

There, is therefore, a good deal more material in a rolled joist than would satisfy calculation, but the cost of distributing the material in an "orthodox" manner would amount to very much more than the price of the extra material. About fifty years ago people had faith in the reliability of cast-iron girders, and in designing them it was of importance to pay attention to the varying bending moment and the varying shear. It is still of importance in designing heavy box or built girders. In designing lattice girders it is good to have in mind the results of this investigation, but the proportions of the members of such structures are given by stress diagrams drawn for each special case.

To make a practical application: find *a* the bending moment, *b* the stress in the flanges, and *e* the shear at the section C D in Fig. 42. Reaction of support at A = 150 cwt., its moment about D = 1,500ft. cwt. (1). Moment of load $\frac{10 \times 10 \times 10}{2} = 500$ft. cwt. (2).

(2) is in opposition to (1) ∴ bending moment = 1 500 500 = 1,000ft. cwt. If we take the effective depth of the beam to be 2·5ft., the stress is $\frac{1000}{2 \cdot 5} = 400$ cwt. = 20 tons. Shear = 150 – 100 = 50 cwt. = $2\frac{1}{2}$ tons.

33. Any other case in beams will be easier than the above. The bending moment, as we have seen, is greatest at the middle. The question of shear, as shown, is a small one; but we meet the difficulty here which we have met in other forms before—it is the difficulty of long struts. In most cases, if the web is proportioned only with regard to the shear it will buckle sidewise, and it must be made thick enough to prevent this. In built continuous-webbed girders the web is stiffened by angles or tees riveted to the web at intervals, and these also support the outer edges of the flanges. This is an economical plan by which the girder becomes a composite one, because these stiffeners are really compression members of bracing. In the case of "rolled joists" they may also be stiffened in this way, but it is found advisable to have their web thick enough to be safe without this stiffening. The question of cost comes into every practical design, and it is found more economical to use rolled joists of uniform section for moderate spans, having extra thick webs than to attempt to graduate the section and stiffen the webs. As I have previously pointed out, there is a distinction between economy in cost and economy of material. In the case of bridging wide spans with a given material, economy of material is necessary to reduce the load on the structure, and this economy of material can only be attained by increased workmanship and increased ultimate expense.

34. To revert to Fig. 42, the bending moment at the centre is

$$150 \times 15 - 150 \times \frac{15}{2} = 1,125\text{ft. cwt.}$$

If we take 2·5ft. to be the distance between the centres of gravity of the cross-sections of the flanges the stress in each flange may be taken to be $\frac{1125}{2 \cdot 5 \times 20} = 22 \cdot 5$ tons, and at 4 tons per sq. in. we must have a flange cross-sectional area of 5·625in., or, say, 6 sq. in.: this calculation will do for all practical purposes. The depth assumed is too great for a rolled joist, and the student may take it to be a continuous-webbed riveted girder.

It may be asked, having regard to the extra thickness of the web to prevent buckling or folding, why not make the flanges heavy and the depth less? The answer to this question is that *stiffness* is a matter of great importance, and it must be taken account of in designing the girder: great stiffness is most easily attained by increasing the depth. The *deflection* of beams will be dealt with later.

35. Let the student have a clear idea of what is meant by *bending moment.* When represented by a number it is the product of the amount of a force in definite units and a distance in known units: we may speak of a bending moment in ft. lbs., ft. tons, &c. If we consider a portion of a beam as a rigid body in equilibrium under two couples, one of which is equal to the sum of the various couples arising from external forces applied at right angles to the axis of the portion of beam in one plane, and the other the equal couple made up of the sum of the couples between the two faces of the section separating the portion of beam or girder from the remaining part, either of these couples is the bending moment at the section.

Up to the present I have said nothing of *moment of inertia* and nothing of *Young's modulus* in connection with beams. The term *moment of inertia* is borrowed from another department of mechanics. We speak of the moment of inertia of an area about a line in its plane, and we speak of the centre of gravity of a plane figure. I have said that, though I assumed that the bending moment is at a section of a girder balanced by the moment of the equal and opposite pulls in the flanges, the web has some value in resisting the bending moment. If we divide the area of the cross-section into a large number of small areas, the stress in each little section, multiplied by its distance from a line called the neutral axis, is the moment of the stress about the axis; the neutral axis is such that the sum of all the moments to one side of it is equal to the sum of all the moments to the other side, but the stress in each small area, supposing the areas to be equal, is proportional to its distance from the neutral axis. So that if p be the stress per unit of area at a point at unit distance from the neutral axis, then the moment of any small portion will be $p\,d^2\,a$, where d is the distance from the neutral axis and a is the area of the portion of cross-section: and the sum of all such moments will be $p\,a\,(d_1^2 + d_2^2 + d_3^2 + \&c.)$.

The expression $a\,(d_1^2 + d_2^2 + d_3^2 + \&c.)$ is called the *moment of inertia* of the section about the axis.

36. I shall take a definite example. Consider the bending moment at the cross-section C D of a rectangular timber beam, shown at Fig. 43 in side elevation and in cross-section. The bending moment is balanced by the sum of all the moments of the stresses in the small rectangles —whose length is b and the breadth of each δ— about the *neutral axis* A B. The length p represents the stress per unit of area at the outer fibres of the beam. It is assumed that the beam is homogeneous, and that at every part *stress* and *strain* bear the same proportion; that the cross-section C D when strained will still be a plane, and that it will take the position shown by the line *s s*. We shall take the small length *s* to represent the strain of the outer fibres. The half depth of the beam is $n\,\delta$. The stress per unit of area along the line $\delta\,\delta$ is $\frac{p}{n}$; and because the breadth b is very small the line $\delta\,\delta$ may represent it, and it may be made to lie as close to A B as ever we please by taking n large enough: its moment is therefore $\frac{p}{n}\,l\,\delta^2$ ($l\,\delta$ being the area)

$$\text{The stress in first line} = \frac{p}{n}\,l\delta$$

$$\text{,, ,, ,, second ,,} = 2\frac{p}{n}\,l\delta$$

$$\text{,, ,, ,, third ,,} = 3\frac{p}{n}\,l\delta$$

and so on.

$$\text{The moment of stress in first line} = \frac{p}{n}\,l\delta^2$$

$$\text{,, ,, ,, ,, ,, second ,,} = 2\frac{p}{n}\,l\delta\,2\delta$$

$$\text{,, ,, ,, ,, ,, third ,,} = 3\frac{p}{n}\,l\delta\,3\delta$$

and so on.

The sum of the moments therefore

$$= \frac{p}{n}\,l\delta^2\,(1 + 2^2 + 3^2 + 4^2 + \&c. + n^2) \quad . \ . \ . \ (1.)$$

The sum—

$$1 + 2^2 + 3^2 + 4^2 + \&c. + n^2 = \frac{n\,(n+1)\,(2n+1)}{6}$$

We take twice this quantity for the moments both sides of the neutral axis.

$$\text{Bending moment} = 2\,\frac{pb\,(n+1)\delta\,(2n+1\,\delta}{6}$$

Now consider $(n\delta + \delta)$ and $(2n\delta + \delta)$. When n is taken very large (remembering that $n\delta = \frac{a}{2}$) δ is very small; and by taking n large enough δ may be made smaller than any quantity that can be named $\therefore\ n\,\delta + \delta$ is in the limit $\frac{a}{2}$ and $2n\delta + \delta$ is a.

$$\therefore \text{Bending moment} = \frac{pba^2}{6} \quad . \ . \ . \ (2.)$$

We arrive at this result by a straightforward investigation which involves only very elementary algebra; and if *moment of inertia* had not been named, it would not suggest itself, but we can pick out *moment of inertia* from (1).

$l\delta$ is the elemental area and $\delta^2 + (2\delta)^2 + (3\delta)^2 + \&c.$ is the sum of the squares of the distances $= 2l\delta^3\,\frac{n\,(n+1)\,(2n+1)}{6}$

$= \frac{4b\,(n\delta)^3}{6} = \frac{ba^3}{12}$ is the *moment of inertia* of the rectangular section about A B. There is utility in bringing *moment of inertia* into the calculation, because this quantity is tabulated for various cross-sections, and it is a convenient quantity to deal with mathematically. It is convenient to represent moment of inertia by the letter I. If we revert to (2), we can put it in the form $\frac{pba^2}{6} = 2\,\frac{p}{a} \cdot \frac{ba^3}{12} = 2\,\frac{p}{a}\,\text{I}$.

We have now a very simple form of expression for the conditions which must be fulfilled by the material and dimensions of a cross-section to withstand any given bending moment when we know the moment of inertia of the cross-section about its neutral axis.

(*To be continued.*)

Surveying and Sanitary Notes.

Lady Sanitary Inspectors.—The Southwark Borough Council has just received from the Local Government Board a notification of sanction to the appointment of Miss M. W. Richardson and Miss F. M. Nicholas as sanitary inspectors to the Council. The Public Health and Sanitary Committee in a report to the Council intimate that they have appointed Miss Ethel Stewart, of Manchester, as a third female sanitary inspector.

Breaking-up the Streets.—On Tuesday, October 8th, the borough of Chelsea completed laying the roadway in Draycott Place with wood. On Tuesday, the 15th, the Chelsea Electricity Supply Company took up the newly-laid wood in order to place a main across the street. When this was done the wood was replaced and traffic resumed. Now the work done by the Electricity Supply Company is undone by the borough of Chelsea, as the paving must be permanently fixed by their own men. Both authorities say the blame lies with the other.

A Park for Romford.—Mr. H. H. Raphael, J.P., hearing that the Romford Urban Council had under consideration the construction of an electric tramway, has offered to give the lake at Gidea Hall Park, and part of the park, to the Council as the nucleus of a public park; for an electric tramway would of course enhance the value of his property, and he considers it a monstrous thing, when the value of property is largely increased by the expenditure of the community, that the whole of the increased value should go into the pockets of the landowner without any contribution from him. The approximate areas of land and water proposed to be given are: land, fourteen acres; water, six acres.

Piccadilly Widening.—The Improvements Committee of the London County Council, which is in charge of the scheme for widening Piccadilly, has not yet prepared a final report for the Council, but it is understood that certain modifications of the original plan have been suggested by the Office of Works, and that these are now under consideration. It is believed that the Office of Works only throws out the suggestions tentatively, reserving its final decision until it learns the committee's views. The suggested alterations would confine the widening scheme to the extreme western corner of Green Park, where the congestion of traffic in front of Hamilton Place is generally admitted to cause a great deal of inconvenience. The original plan was to throw into the roadway a strip of the park for its full length of nearly half a mile in Piccadilly.

Keystones.

A New Church at Chertsey has been erected at a cost of over £5,000.

A New Central Free Library at Hull, costing £20,000, has been erected.

Mr. William Skiller, architect, of Hastings, committed suicide recently at the age of sixty-one or sixty-two years.

Mr. Silvanus Trevail, F.R.I.B.A., J.P., Pres.S.A., has been returned at the head of the poll for the seventh time by the electors of the Eastern Ward of the city of Truro.

The R.I.B.A. Kalendar for 1901-2 has just been issued. It contains the usual information about all matters connected with the Institute, including the questions set in the examinations held last June.

A New Wesleyan Church at Cliffe of simple Gothic design is being erected by Messrs. George Gates & Son, of Frindsbury, from designs of Messrs. J. W. Nash & Son, of Rochester. It will afford accommodation for a congregation of 300, and the inclusive cost will be about £1,300.

The Queen Victoria Memorial Hall at Kensington Place, Notting Hill Gate, was opened recently, and completes the first part of a scheme which is being carried out under the patronage of the Princess Louise to erect an institute to ameliorate the condition of the poorer parishioners of St. George's Campden Hill. The architect was Mr. W. B. Medlicott.

A New Church at Carlin How, Brotton, has been erected. It is a brick structure in the Norman style, of cruciform design, and consists of a nave with two bays, together with a chancel. Messrs. Hickes & Charleswood, of Newcastle, were the architects, and Messrs. Cruddas & Sons, of Guisborough, the builders. The total cost of the church and furnishings is £2,300.

An Oak Chancel Screen with Rood Cross has been erected in the parish church, Whitchurch, Hants, in memory of Queen Victoria. It is from the design of Mr. Walter E. Hewitt, A.R.I.B.A., of 22, Buckingham Street, Strand, W.C., and was carried out by Mr. N. Hitch, of 60, Harleyford Road, Vauxhall. The cost, including the necessary moving of the stone pulpit, was about £100.

St. Saviour's Chapter-House was opened recently. The building which has been acquired for the purposes of the chapter was originally the chapel of St. Thomas the Martyr, which was founded in 1213. It is situated in St. Thomas Street, Southwark, in the neighbourhood of Guy's Hospital. Since the building has been taken over by St. Saviour's it has undergone several alterations, and has been thoroughly cleaned and re-decorated. A feature of the house is a fine old oak gallery which runs round the northern and western walls. The reredos and communion table, also of oak, have been allowed to remain, and the old chapel seats have been broken up and utilized for the purpose of panelling the walls. Mr. Arthur Bartlett was the architect for the work.

The Edinburgh Architectural Association now comprises fellows, members and associates. The associates' section is to have a series of meetings and papers of its own, and has appointed the following office-bearers: Chairman, Mr. J. Stuart Syme; vice-chairman, Mr. J. F. Matthew; hon. secretary, Mr. J. McIntyre; committee, Messrs. J. Sidey, D. Davidson, Hay Lamont, J. Jerdan, B. S. Murphy and J. A. Arnot. Last week the formal opening of the new rooms, No. 117, George Street, Edinburgh, took place, when the president and office-bearers held a reception, at which about 250 ladies and gentlemen attended. Sir George Reid, president of the Royal Scottish Academy, declared the rooms open, and Bailie W. S. Brown, as representing the city, and Professor Baldwin Brown, as representing the University, addressed the gathering.

At Crewe Cottage Hospital a children's ward has been opened as a memorial to Queen Victoria.

£4,000,000 for Housing.—The housing schemes now in hand or about to be undertaken by the London County Council will involve an expenditure of nearly four millions. Soon the Council will possess 250 blocks of workmen's dwellings, accommodating 92,000 people and yielding an annual rent of £161,000.

At the Church of St. Mary, Leith Woods, a reredos has been added of alabaster, with the outlines of the design gilded. It comprises nine panels. The super-altar and panelling each side of the altar are of fumigated oak. The sculptors are Messrs. Flint Brothers; the gilders, Messrs. W. O. C. Powell; and the architect is Mr. G. F. Bodley, A.R.A.

The Glasgow Architecture Association held a meeting on Tuesday, November 5th, the president (Mr. Charles E. Whitelaw) in the chair. An interesting member's paper, by Mr. James Salmon, was read on "Voices in Stones, or the Language of Architecture." A discussion followed, opened by Mr. Alexander McGibbon, A.R.I.B.A.

A New Reredos at St. Martin's Church, Caerphilly, is to be erected to perpetuate the memory of the late Rev. Thomas Jenkins, who was for twenty-eight years the rector of the parish. The design has been prepared by Mr. George E. Halliday, architect, Cardiff. The reredos will be constructed of pink polished alabaster, with Irish green marble shafts and gold mosaic behind three figures in the panels. The cost of the work is estimated at £250.

The new Church of the Ascension at Stirchley, King's Norton, was opened recently. Mr. W. Hale was the architect. The church is in Late Decorated style of Gothic, the walls being of red bricks, with outer dressings of terra-cotta. The internal piers, arches and dressings are in selected Farleigh Down Bath stone, and accommodation is provided for 578 adults. The nave is 82ft. long by 35ft. wide, with north and south ambulatory aisles, each having five bold but low arches from the nave. The chancel is 32ft. 6in. by 22ft., and on the south side are the clergy and choir vestries, the latter of which is carried up as a tower, in which are the organ-chamber, ringing loft, and belfry with provision for eight bells. The cost has been £8,400.

The Liverpool Victoria Memorial.—The committee having the Liverpool memorial in charge met recently at the Liverpool Town Hall and decided upon the awards for designs for the memorial. A considerable number had been received. The first premium (£100) was awarded to Mr. R. Lindsay Clarke, sculptor, Cheltenham, associated with Mr. R. A. Briggs, F.R.I.B.A., of London. The second premium of £75 was awarded to Mr. C. J. Allen, sculptor, of Liverpool, and Messrs. Simpson, Willink & Thicknesse, architects, of Liverpool; and the third premium of £50 to Mr. H. C. Fehr, of South Kensington, associated with Mr. J. S. Gibson, architect. The successful competitors have been asked to submit models to enable the committee to arrive at a decision. Meantime the committee will not make public the designs.

At Charing Cross Hospital the basement has been reconstructed. A large kitchen, with the newest and most efficient apparatus for cooking by gas and steam, has been provided. In addition to the kitchen a scullery, two new larders, and two new store-rooms and a commodious servants'-hall have been constructed, to which must be added a workshop for the engineering department adjoining the new boiler-house. The accommodation thus provided will serve for the whole hospital when it is completed. The cost of these improvements, including the new boilers and the new sanitary annexe to the wards of the south wing of the hospital, amounted to £12,000. For the construction of the new buildings, which comprise a new and vastly improved out-patient and casualty department, a suitable home for the nursing staff, quarters for the resident medical and surgical staff, isolation wards and wards for special diseases, the tender of Messrs. Holloway Brothers for £82,730 has been accepted; but at least £100,000 will be required before the new Charing Cross Hospital will be completed.

The Glasgow International Exhibition closed on Saturday last.

A New Mace for Honiton Corporation, of jet black ebony, highly polished and mounted with silver, 2½ft. long, the orb being 4in. in diameter, has been made by Messrs. Harry Hems & Sons, of Exeter. It has been designed by Mr. William Ward, the borough surveyor.

"Views and Reviews."—Two printers' errors crept into the review of Mitchell's "Advanced Building Construction," published in our last issue. In line 28 from the bottom of the third column on p. 217, $CaSO.2H_2O$ should read $CaSO_4.2H_2O$, and in line 10 from the top of the middle column on p. 218 "hydrated oxide of hydroxide or iron" should read "hydrated oxide or hydroxide of iron."

The Passmore Edwards Limehouse District Public Library, at 638, Commercial Road, E., was opened recently. The newsroom is 27ft. by 38ft., and is capable of holding about seventy persons. The lending-room is on the ground floor. The reference-room has seating accommodation for about eighty readers. The cost of the building and fittings will be about £10,000. The architects were Messrs. Clarkson, and the contractors Messrs. Sabey & Son. The building is in red bricks and stone in Renaissance style.

A Manchester Competition.—The Watch Committee of the Manchester City Council have awarded the premiums for competitive plans for the erection of the proposed new fire-station as follows: First premium, £300, Messrs. Woodhouse & Willoughby and Mr. John Langham, of Manchester (joint plans); second premium, £200, Mr. George Mackie Watson, Edinburgh; third premium, £100, Messrs. Magnall & Littlewood, Spring Gardens, Manchester. The new building is to be erected in London Road, on the triangular plot of land at the junction of Whitworth Street. It is estimated that the total cost, including land, will be over £100,000.

The Royal Institute of the Architects of Ireland held a general meeting last week. The chair was taken by the president, Sir Thomas Drew, P.R.H.A., F.R.I.B.A. The ballot papers for the election of a president for the next three years were opened and examined, and the chairman announced that Mr. George C. Ashlin, R.H.A., F.R.I.B.A., was duly elected. The following were then elected members of the Institute: Mr. John Barrett Robinson, Belfast; Mr. William Blackwood Blackwood, Belfast; Mr. Frederick Shaw, Drogheda; Mr. Percy Morgan Jury, Belfast. Some slight alterations in the by-laws of the Ulster Society of Architects, which is affiliated with the Institute, were considered and approved of.

Mr. John Campbell died recently at the age of seventy-five years. He who went out to Bombay shortly after the Mutiny and joined a firm of architects, under whose direction the Elphinstone Circle, the Victoria and Albert Museum at Byculla, and the dam of Tulsi Lake (one of the sources of the Bombay water-supply) were constructed. Later, he became senior partner of another firm, and from plans prepared by him a number of the prominent buildings in the city were built. He also carried out some important irrigation works in Southern India Before settling in Bombay Mr. Campbell went out to the Crimea as assistant to a firm of contractors, and was present at the fall of Sebastopol.

Enclosure of Stonehenge.—The Executive Committee of the Commons and Footpaths Preservation Society has obtained eminent legal advice as to the recent enclosure of Stonehenge. It appeared that several clearly-defined tracks leading to the monument had been obstructed by the erection of a barbed-wire fence, and the Society was advised that, prima facie, there was a strong case for the existence of public rights of way over these tracks. The Committee resolved to petition the local authorities to protect the public rights involved, and letters from eminent archæologists were read protesting against the enclosure of Stonehenge on the ground that the character of the monument had been entirely altered by the existence of a high barbed-wire fence in close proximity to the remains. It was further pointed out that the stones could be amply protected from injury without enclosure by means of the Ancient Monuments Protection Acts.

Mr. William Henry Read, architect and surveyor, of Bristol, died recently at the age of fifty-one years. He was the only son of the late Mr. William Read, surveyor, of Swindon.

Mr. Edward Wickens Fry, of St. Martin's Terrace, Canterbury, died last week. Deceased, who was born in 1836, had for many years carried on the profession of architect and surveyor in Dover, and practically up to the time of his illness he was engaged in the working out of plans for new hotels in Dover.

Weybridge National Schools.—The rector and managers have accepted the plans prepared by Mr. A. H. Ryan-Tenison, A.R.I.B.A., 12, Little College Street, Westminster, for the re-modelling and enlarging of the infants' and girls' schools, together with a new residence for the master of the boys' school. It is hoped to proceed with the work shortly. The present buildings are the work of the late Mr. Pearson, R.A.

York Architectural Society.—The members of this society held their first meeting on Thursday last. In the course of his inaugural address the newly-elected president, Mr. C. H. Channon, F.R.I.B.A., remarked that the stigma attaching to the Institute that it was "Metropolitan only" did not now apply to it, for it had attained a national character and influence, and its work was each year increasing in importance.

The Kaiser and the Fountains.—In the matter of the fairy-tale fountain the Kaiser has scored a victory. The committee which met to consider the question whether it would be consistent with maintaining the general plan of the fountains as sketched by the city architect to follow the Kaiser's suggestions, have now decided that it is possible to unite the city architect's plan with the Kaiser's conception of what fairy-tale fountains should be.

A New Passmore Edwards Public Library at Bow has been opened in Roman Road. Mr. S. B. Russell was the architect. The magazine, room seats between sixty and seventy readers and the small front room has accommodation for about twenty-four. In the basement is the newsroom, with thirty-six newspaper-stands. In the front of the building is the lending library. On the upper floor is accommodation for the librarian. The cost was £6,000.

Trade and Craft.

Ventilating and Heating Appliances.

In the Machinery Hall at the Glasgow Exhibition Messrs. James Keith & Blackman Co., Ltd., of 27, Farringdon Avenue and 59, Farringdon Street, London, E.C., exhibited a number of appliances for heating and ventilating; and, in addition, their appliances were in evidence in the restaurants throughout the Exhibition, in the grounds, and in connection with the ventilation of the steam-pipe trenches under the Machinery Hall itself. A prominent feature of the firm's exhibit was a kiosk enclosing a fairy fountain and having four electric Blackman fans at the top. Suspended from overhead were four high-pressure gas lanterns of 1,000 candle-power each, which owed their brilliancy to a Keith automatic gas-compressor shown working from the city water service (this compressor was similar to those used for lighting the grounds). "Aiolian" and other radiators were exhibited, as well as a number of boilers. Keith's "Challenge" hot-water boiler is formed of sections placed one on another, with machined joints; 50,000 of these boilers are in use in different parts of the world. About the middle of the stand was a huge Blackman fan (96in. effective diameter), and further on a complete Keith "Python" sectional boiler, which had about 1,000 sq. ft. of effective heating-surface and was capable with easy firing of warming nearly five miles of 4in. hot-water pipe, or its equivalent in sq. ft. of radiator surface. Hydraulic rams, Keith's open-fire hot-water apparatus, a complete drying plant, and various forms of the company's valves and fittings for steam- and hot-water heating were also included in the exhibit. Whilst referring to this firm it is opportune to note that they are considering a suggestion to reduce the hours of labour at their works in the Holloway Road. The forty-eight hours' week has already been introduced at their works at Arbroath.

Door and Window Fittings.

The increasing practice of issuing catalogues in handy book form is a most commendable one, chiefly because it makes reference so much easier. This is apparent in the new catalogue of specialities just issued by Mr. Robert Adams, of 65 and 67, Newington Causeway, London, S.E. It contains, in addition to inventions which have been approved by the tests of many years, some newer patterns in door-springs, fanlight gear, &c., to the design of which much attention has been devoted. A number of excellent door springs are shown in the catalogue. The special advantages of the double-action "Crown" and "Cushion" patterns for swing and rebated doors are that they open and close 45 degs. beyond the right angles, while the single-action "London" and "City" patterns open and close from the angle of 180 degs., *i.e.*, the half circle; moreover, the internal spring is large and easily regulated, and the whole fitting is very compact. Other varieties are provided for exposed positions and for doors of all kinds, one being specially intended for swing-doors situated immediately over a girder near the surface, a most useful spring. Then there are numerous pneumatic door-springs shown in the catalogue—such as the "Empress Victor," the "Combination" silent check and adjuster, the "Norton" and the "Eclipse"—while further on are illustrated various forms of patent hinges and fastenings for gates and doors. The section devoted to fanlight gear is most comprehensive. The self-sustaining "Link-Motion" patent fanlight has vertical screw rod and regulator action, and is recommended for all ordinary fanlights; it is largely used in Government buildings, Board schools, banks, offices and private residences. Another variety is the "Double-Arm" screw-opener, which fits between two fanlights and operates them simultaneously. The "New Century" opener is practically noiseless, and closes the fanlight with great rapidity, holding it automatically fastened at any point. The "Caledonia" pattern is intended for sashes hung at the bottom and opening inwards, while the "Twin-Screw" pattern can be applied to these fanlights or to those top hung, side hung or centre pivoted. Many other varieties are shown, including the "Glide" patent concealed opener and the patent "falling link" rack-wheel, and the selection should be sufficient to satisfy every requirement. Systems of patent opening and closing gear for fanlights and sashes in lanterns, conservatories, &c., are also extensively dealt with, the remainder of the catalogue being devoted to patent reversible and safety window fittings, panic and other bolts, casement stays and fasteners, sash-balances, fittings for sliding doors, and door furniture in general. The catalogue is altogether an excellent one, and a copy should be in the possession of all architects and builders.

THE STANDARD TECHNICAL AUTHORITY.

"SPECIFICATION"

SPECIAL ANNOUNCEMENT.

The Proprietors of the "Builders' Journal" beg to announce that the Fifth Issue of their Annual work, "SPECIFICATION," is now preparing for press, and will be published in December next.

"Specification" is the Standard Technical Authority for Architects, Surveyors, Engineers, and all interested in the Building and kindred trades.

Each Section has been carefully revised and brought up to date, and many New Features have been added.

The whole of the Fourth Edition has been sold out, and copies of No. 5 cannot be guaranteed unless orders are received in good time.

Advertisement Rates and full particulars of spaces available will be forwarded upon application to the Advertisement Manager. All copy for Advertisements should be sent in before November 15th.

A PROFESSIONAL OPINION.

Mr. H. R. HARDING, Architect, of Leicester, writes under date October 10th, 1901:

"I consider the work should be in the office of every Architect, forming as it does, in its plan and scope, an invaluable source of reference in almost every point likely to be raised in ordinary architectural surveying practice.

"I do not doubt, as you proceed with the publication, it will become more generally known, and receive the appreciation it fully deserves.

"I have produced it in Court as an authority when giving evidence in building cases, and it has been accepted as one of the leading technical works of the day. I am looking forward with anticipation to the next volume."

Price 5s. Post free 5s. 6d.

Intending Subscribers are requested to send in their orders at once.

COMING EVENTS.

Wednesday, November 13.

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part II.).—Mr. E. Petronell Manby, B.A., M.D., on "The Hygiene of Byres, Lairs, &c.," 7 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. W. S. A. Gordon on "Notes on some of the Cathedral Towns of England," 8 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Opening Meeting of Session. Address by the president, Mr. Frank Cows, F.R.I.B A., 7.30 p.m.

INSTITUTION OF SANITARY ENGINEERS.—Meeting of General Purposes and Finance Committee at 4 p.m. and of Council at 7 p.m.

Thursday, November 14.

CAMERA CLUB.—Mr. Basil N. Tebbs, on "Bacteria," 8.15 p.m.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—Mr. C. F. Brindley, on "Organ Cases and Organ Chambers."

MANCHASTER SOCIETY OF ARCHITECTS. — Mr. Paul Waterhouse, M.A., on "Architecture among the Modern Arts," 6.45 p.m.

Friday, November 15.

ARCHITECTURAL ASSOCIATION.—Mr. Max Clarke on "The Sanitation of a Country House," 7.30 p.m.

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part II.).—Mr. E. Petronell Manby, B.A., M.D., on "The Laws, By-laws, and Regulatious affecting the Infection and Sale of Meat, &c.," 7 p.m.

INSTITUTION OF MECHANICAL ENGINEERS.—Prof. W. E. Dalby, on "The Balancing of Locomotives," 8 p.m.

Monday, November 18.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Mr. R Anning Bell, on "Mosaics," 8 p.m.

LIVERPOOL ARCHITECTURAL SOCIETY.—Meeting in Free Library, William Brown Street. Exhibition of Collection of Books on Architectural Subjects 6 p m.

SURVEYOR'S INSTITUTION.—First Junior Meeting at 7 p m.

ROYAL ACADEMY.—Demonstration in Anatomy: The Trunk. By Prof. Arthur Thomson, M.A, 4 p.m

Tuesday, November 19.

INSTITUTION OF CIVIL ENGINEERS.—Mr. John A. F. Aspinall, M.I.C.E., on "Train Resistance," 8.m.

SOCIETY OF DESIGNERS.—Mr. George C. Haité, R.I., R.B.A., on "Some Remarks on Design and Designers of the Victorian Epoch," 8 p.m.

ARCHITECTURAL ASSOCIATION OF IRELAND.—Ordinary Meeting at 7.45 p.m.

Wednesday, November 20.

RUSKIN SOCIETY OF BIRMINGHAM.—Mr. Howard S. Pearson on "The Pathetic Fallacy," 7.45 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Students' Evening.

DANTE SOCIETY.—Lecture by Dr. Hodgkin, 3 p m.

SOCIETY OF ARTS.—Opening Address by the Chairman of the Council, Sir William Henry Preece, K.C B., F.R.S., 8 p.m.

Thursday, November 21.

ROYAL ACADEMY.—Demonstration in Anatomy: The Trunk and Upper Extremity. By Prof. Arthur Thomson, M.A., 4 p.m.

Friday, November 22.

ARCHITECTURAL ASSOCIATION: DISCUSSION SECTION.—Mr. Vivian H. King, on "Design in Furniture," 7.30 p.m.

GLASGOW TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMEN'S SOCIETY.—Mr. George Herbertson on "Foreign Competition in the Building Trades," 8 p m.

BIRMINGHAM ARCHITECTURAL ASSOCIATION — Mr. J. A. Gotch, F.R.I.B.A., on "Architecture of the Eighteenth Century in England."

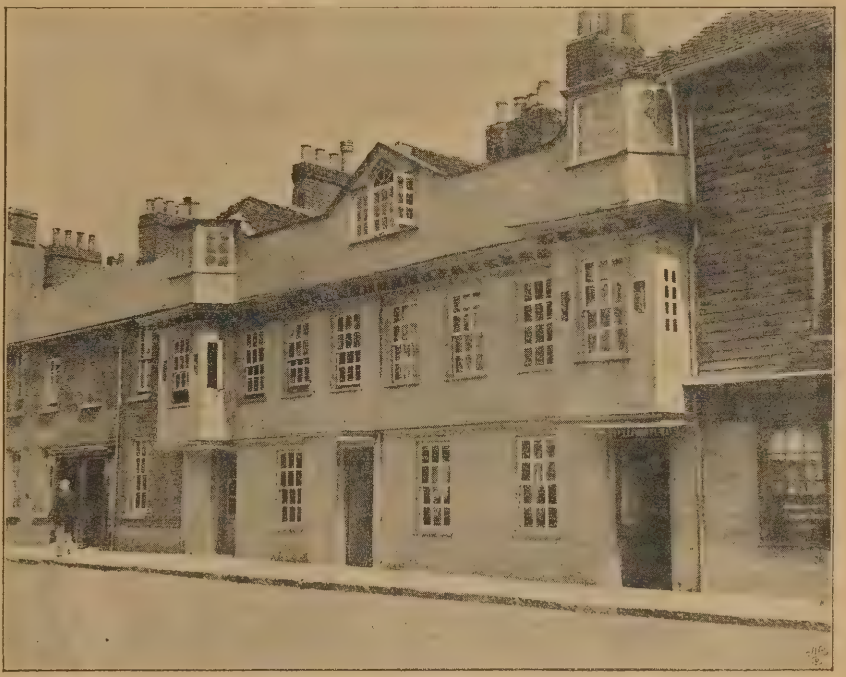
An Architectural Causerie.

Take Note. OUR attention has been called to a most audacious proposal in connection with the competition for a new art school at Hull (particulars of which are given in the list of "Competitions Open" published on another page). Without any request or communication whatever, a certain firm of North-country architects received a letter from an individual at West Dulwich stating that his usual mode of working in connection with competitions was to prepare all the necessary designs upon the understanding that he was allowed about half-value of his time, half or third of any premium taken, and 1 per cent. on the contract amounts. "It is, of course, difficult for me to define any exact sum unless I have the 'particulars.' Will you kindly let me see these? Assuming an average number of drawings to an eighth scale, I think I should want about twenty guineas. I should certainly expect a combination of your superior local knowledge and my special experience to lead to a win if justice is done. The drawings would be submitted in your names alone, I presume." Such was the proposal made to this firm of architects. In reply to it, the chief partner wrote that the impression given to anyone into whose hands the letter fell would be that the firm had been corresponding with this individual with a view to obtaining designs from him to be submitted under their own names. "While I have long been aware," continued the writer, "that there existed persons knaves enough to make such proposals to architects in practice, I have not yet been able to believe that there existed any architect fool enough to accept such a proposal." Just as certain "business" transactions are no less criminal than the theft of a loaf from a baker's shop, so this architectural forgery is only an aggravated form of the architectural "ghost." We give publicity to this case, not on account of its impertinent novelty, nor to point a moral on the baseness of the human kind, but simply to warn others of the gentleman from West Dulwich who is willing to sell his "special experience" after the manner of a charlatan. —Since the foregoing was written we have received from the firm of architects in question a further letter from this "expert" in which he says that his former letter was addressed to the wrong firm, being an answer to an enquiry. Then follows much vulgar abuse, which it is not our desire to print, concluding with the remark that it is an unhappy reflection for him to see no superior central or administrative power invested with ability "to weed out ignorant and incompetent blackguards." In our opinion the whole thing is a fraud. We do not believe that this gentleman—who has such tender susceptibilities, though he uses the language of Billingsgate—did write in reply to an enquiry by another firm, and our belief is strengthened by the fact that his first letter (not the envelope only) was addressed to the firm of architects in question. It is not likely he would mistake the names and addresses, and send the letter to a firm with whom he had had no previous communication, and who, moreover, are scores of miles from Hull. So that it is fairly certain we have found a rogue here. We would not doubt so honourable a gentleman, yet we cannot conclude without observing, with regard to his qualifications as an architectural expert, that we have failed to discover any trace of his being an "architect" even. But this, of course, is only a minor matter.

Underground Trams. UNDERGROUND tramways are new to this country, though they can be seen working in Boston or Budapest, while New York, Berlin, Paris, and other cities, have lines in course of construction. The London County Council now propose to adopt them, and will apply next session for Parliamentary powers to construct an underground tramway under the new street from Holborn to the Strand, terminating on the Victoria Embankment at one end and in Theobald's Road at the other. The cost is estimated at £282,000. As the system is not generally known here, it may be well to state that the trams are run in a rectangular subway, the roof of which (supported on steel beams) forms the bed of the street. The actual distance from the bottom of the New York subway to the street level is only about 15ft., and at Budapest it is not more than 12ft. The temperature in these subways is about the same as that outside, and abundant light can be admitted through the ground-glass covers of stations and at gratings and street refuges. As to speed, the New York subway has four tracks, the middle pair reserved for trams running about 35 miles an hour, with stations over a mile and a half apart, while the remaining two are for trams travelling about 14 miles an hour, with stoppages every quarter of a mile. The system is an admirable one, and will doubtless prove a most satisfactory solution of the street-traffic problem in London. There are, of course, difficulties to be overcome. The network of existing pipes and sewers involved will cause much trouble. For example, the cross-sewer beneath Holborn is 4ft. 6in. high, exclusive of 18in. of brickwork, and is 10ft. 9in. below the surface, so that there is no room to pass over it, while its diversion will be no easy matter. Though the statement is made that in Boston and New York no material inconvenience was caused while the lines were being constructed, it is fairly certain that traffic will be disturbed for a time at the ends of the new street. However, these things must be. Afterwards will come the benefit of being able to travel rapidly and comfortably across the heart of London, instead of being jostled in crawling 'busses or financially ruined by cab-drivers.

Old Houses at Salisbury. THE illustration on this page of the charming old houses at Salisbury is from a photograph which has been kindly lent to us by Mr. Ernest Emerson.



OLD HOUSES AT SALISBURY.

The Ancient Lights Case. The appeal case of *Warren* v. *Brown* (see p. 242) is the most important case affecting "ancient lights" which has been heard for some time, and should therefore be carefully noted. Authorities on this subject are so much at variance that the most recent decisions in the courts alone form any sound basis for determining the merits of particular cases. In this instance the question turned on what constituted substantial diminution of light to a building in Leicester which from 1860 to 1884 had been used as a boot and shoe factory, but has since been used as a hosiery manufactory. Owing to the delicate machines employed, the latter needs more light than the former, and when, two years ago, the defendant raised an old building on the opposite side of the street the light to the factory windows was diminished, though there was still enough for "ordinary purposes"—and that was the crux, for the plaintiffs claimed the "extraordinary" amount of light which they had formerly enjoyed. Mr. Justice Wright found that the plaintiffs' lights had been substantially interfered with, and assessed losses at £300, but he made an additional finding dismissing the action on the ground that there was still abundant light "for all ordinary purposes of inhabitancy or business." In other words, as Lord Justice Romer put it, Mr. Justice Wright seems to think that there is a sort of standard in the matter of light, and that if a particular house is extremely well lighted by its ancient lights, these may with impunity be substantially interfered with so long as the house does not fall below the standard. The Court of Appeal think this is an erroneous view of the law. They therefore decided in favour of the plaintiffs, damages to be assessed and costs to be paid by the defendant. In the case of *Kelk* v. *Pearson* (L.R., 6 Ch, 809) Lord Justice Mellish said: "I cannot think that it is possible for the law to say that there is a certain quantity of light which a man is entitled to, and which is sufficient for him; and that the question is whether he has been deprived of that quantity of light. It appears to me that it is utterly impossible to make any rule or adopt any measure of that kind. It is essentially a question of comparison, whether by reason of deprivation of light the house is substantially less comfortable than it was before." The Court of Appeal consider this to be the accurate statement of the law and have upheld it, and in doing so they get rid of the very great difficulty of standard adopted in Mr. Justice Wright's judgment. This clearly defines one point, but it only tends to emphasise the necessity of either abolishing altogether such contentious privileges as "ancient lights" or so modifying them that they cease to be incessant matters of controversy.

THE COWL TESTS.

IN this much-criticised and, one may fairly say, much-abused report,* we have the result of about twenty-three years' labour of a committee of sanitary experts, led by the late Mr. Rogers Field, and aided by a staff of assistants. It is not surprising that in so long a period the hand of death removed one after another of the committee, until Mr. Field was left alone, with failing health and the work still incomplete. In this condition it was handed over to the Council of the Sanitary Institute who, not relying upon their own judgment, called in Professor W. N. Shaw to advise them, firstly, whether the information collected was worthy of circulation, and, this being answered in the affirmative, to supervise the final completion and publication. In the 250 pages of the report we have the chief facts (and some of the inferences derived from them) of a most elaborate series of about 9,000 experiments on the action of the wind upon air-meters, tubes and terminals. The original idea was to test the efficiency of various cowls, hence the term "Cowl Committee" which has been applied to the investigators, but it was soon found that it was necessary first to test the means by which that efficiency was to be measured. Even then the Committee was working in the dark as regarded the essential conditions for securing accuracy, and with the best intentions to proceed intelligently the experiments amounted to thousands before some of the first principles were ascertained. Among the historical notes a letter from M. Charles Joly to Mr. Field in 1879 has this notable sentence: "The cowls you experiment with are nothing else but *paravents* [screens]; some of them may act well, like plain open pipes, in case of a strong wind, but are actually worthless, and, I say more, prejudicial, in case of calm weather, when you mostly want ventilation." In his reply to this communication Mr. Field stated that the primary object of his research was the investigation of the induced current produced by the wind in ventilating tubes. He says: "We intend to measure the velocity of the wind, also the corresponding velocity of the up-current, and ascertain, if we can, what relation the one bears to the other. This, as far as I know, has never yet been done. We are at present engaged in testing our air-meters and anemometers, so as to obtain a reliable standard on which to work. The result of these experiments, as far as they go, shows that these instruments, as ordinarily used, are not to be much relied upon, and if we do nothing more than obtain correct data with reference to them I think we shall be doing good service to the science of ventilation." On looking carefully through the report there appear to be many points open to criticism and the total result is certainly disappointing, but an unbiased reader must come to the conclusion that an honest endeavour has been made to arrive at accurate practical results, and Professor Shaw says (p. 344), "although the numbers obtained for the ratio of the flow along the pipe carrying the cowl to the flow without the cowl give us nothing that can be regarded as a constant for the cowls, and consequently the use of the term 'efficiency' to denote the ratios obtained is appropriate, the experiments in themselves give a great deal of information of great value." There is however a want of scientific method; the test of accurate experiments is that gradual modifications should produce graduated results, and where any break in the continuity of the results occurs it is essential that the investigation should be prolonged until the cause for the break is found. No such perfect continuity is visible in the tabulated results; in many cases they are erratic, and the variations are so great that no general law seems to be discernible. The experiments as a whole appear to be wanting in precision, too many points having been followed up without preliminary matters being sufficiently determined. Professor Shaw's introductory note to Part V., "Experimental Results for Terminals and Cowls," gives the pith of the whole subject and emphasizes the weak points. Some of the terminals designed by the Committee gave results greatly exceeding those of plain pipes or other terminals in efficiency, and have been made the subject of patents, presumably for the purpose of preventing a monopoly, as of course the position held by the Sanitary Institute would preclude it from dealing with them commercially; and whatever may be the final verdict upon the report the public are the gainers by the mass of information laid before them. Naturally, some of the manufacturers will be disappointed that their cowls have not been placed first, but they have no reason to doubt the *bona fides* of the experimenters. Possibly other conditions would have produced other results, and it is a matter for regret that the Committee was not a more representative body.

CHICHESTER CATHEDRAL.

Appeal for Funds to "Repair" it.

THE general committee for the repair and restoration of Chichester Cathedral have determined to publish the report of the late Sir Arthur Blomfield, A.R.A., on the state of the Cathedral, and to issue an appeal for funds to commence the necessary work and to continue it until its completion. The report, which was almost the last work of that eminent architect before his death, endorses the opinions expressed in the previous reports of the late Mr. Gordon M. Hills and of the late Mr. Pearson, R.A., as to the serious nature of the repairs that are immediately and urgently required. The execution of these repairs has been delayed through the paramount necessity of rebuilding the north-west tower, with a view to securing the vaulting of the west end of the nave. The collection of the necessary funds and the execution of that work have occupied about seven or eight years, but the tower is now completed, "and has added greatly both to the stability and beauty of the Cathedral, inside and out."

In the meantime the process of decay has gone on, and the repairs enumerated in the three successive reports of the architects named above have become more and more pressing.

It is expedient to carry out the several portions of the work in well-defined sections as opportunity occurs. The order in which the various sections will be taken must be decided later, when it is known what funds will be available. "The object will be to preserve the features of this ancient building in all the beauty and grace which were given them by the builders of old time that has so long gone to their rest."

A legacy of £500 from the late Mr. France, a munificent benefactor of the Cathedral, provides for the west porch and entrance; but beyond this there are no funds available.

What the sum ultimately required will be it is hardly possible to state at the present time, but the cost of complete repair could not be safely calculated at less than £30,000. The works described by Sir Arthur Blomfield as urgently needing speedy attention may be reckoned at £15,000.

THE MODERN ARCHITECT.

THE opening sessional meeting of the Northern Architectural Association was held on Wednesday last at Newcastle, the chair being occupied by the president, Mr. Frank Caws, F.R.I.B.A. A letter was read from Mr. William Glover, F.R.I.B.A., past-president, submitting his resignation as a member of the Council owing to ill-health. The president and Mr. A. B. Plummer joined in expressions of regret at Mr. Glover's impending departure, and the hon. secretary mentioned a proposal to entertain Mr. Glover to dinner or to present him with some token of their esteem.

The president then delivered his inaugural address, in the course of which he said: The nineteenth century will be distinguished by the future architectural historian as the most fickle century of all in regard to the number, variety and incompatibility of the styles and fashions of buildings which it has so restlessly and inconstantly first embraced and then spurned. "As dead as Queen Anne" is an expression which has passed into a common by-word; yet it is remarkable that if there is any distinguishable survivor of the architectural fights of the great Victorian age it is the Queen Anne type, which still possesses much vitality, and seems to enjoy a fair prospect of extending its influence far into the twentieth century.

Though it is best for every architect to work in the style which is most congenial to him, yet, consciously or not, we are all deeply influenced by one another. The mind of the modern architect is as the basin of the sea, into which all the rivers of the past ages of architectural styles run; and it will not be strange, but quite natural, if this commingled ocean of ideas should present ultimately a glorious cosmopolitan expansiveness of majestic thought as the outcome of all its agitation.

Regarding the future of British architecture, we need not ask "what will the end be?" For there will be and can be no end to the mutable fashions affected by restless humanity. Signs are not wanting that the rising generation of architects, to whom the twentieth century belongs, are coming to regard an intimate acquaintance with structural principles as a *sine qua non* of professional proficiency; for not merely statics, but also dynamics, are now included in the curriculum of the preliminary examinations which even novitiates must pass ere they can take rank merely as students of the Royal Institute of British Architects. This remark naturally introduces the one subject which at the beginning of this new age holds the field more than any other—education. The education which in the centuries past was given to polish a man into a "gentleman" has in this twentieth century entered on a new career, with the nobler aim of teaching gentlemen to become workmen. In this new order of education architects, of all men, can least afford to be left behind. The truly successful modern architect must of necessity be an artist, scientist and commercialist, and withal an excellent society man, all rolled into one. To those among us to whom emphatically the twentieth century belongs, it is neither too late nor too soon to set before ourselves these three component qualities—art, science, business—and to make up our minds which of the three we will worship most and follow hardest; or whether we will strive for that highest ideal, and most honourable because most difficult of attainment, in which a deep love of art, familiar knowledge of science, and strict attention to business are combined in the fully-developed, every-way-qualified, up-to-date architect. The youngest among us, in view of these four alternatives, should act on Goethe's advice: "Choose well! Your choice is brief and yet endless!"

The popular measure of success is not supreme technical skill, is not even genius itself, but is gold. This debasing influence reveals its presence amongst us by an increasing disposition to bribe clients to employ us, by offering our services at rates of remuneration below the rates fixed by usage. To what extent these nefarious practices obtain amongst architects it is not easy for the clean-handed to discover. But it is certain that amongst building contractors of good standing and honourable character the acceptance by some architects of secret commissions engenders suspicion and lack of respect, which tend to lower the moral status of our profession and do it harm to an extent unknown and quite incalculable. The occasional offers of secret commissions to architects who decline them reveal the unpleasant fact that all architects do not decline them. One of the best results of the formation and maintenance of the Royal Institute of British Architects and its kindred provincial associations is the promotion of those individual friendships between fellow-architects which are the best practical guarantee for uniformity and clean-handedness of practice; while another way in which the power of association has proved peculiarly helpful to the rising generation of North-country architects is in the acquisition of our grand library, that veritable Golconda of architectural wealth. Surely we should fix on the entablature of the chief book-case a small silver plate permanently recording our indebtedness to our good friend Mr. Charlewood for devoting so many years to that splendid library.

---

* Report on the work of the Committee appointed by the Sanitary Institute of Great Britain to practically test ventilating exhaust cowls. (Journal of the Sanitary Institute," vol. xxii., part iii., October, 1901.)

These are days in which originality is much (perhaps too much) sought after in architecture, as in art generally, and also in literature. But originality, as Sir Joshua Reynolds was never tired of reminding Royal Academy students, is the outcome not of ignorance but of knowledge of what others have done. Certainly the architect who neglects the library is (other things being equal) the least likely to develop originality worthy of the name; for, paradoxical though it may seem, originality is undoubtedly brought to birth by education breaking the fallow ground of the intellect. We need to exercise in architectural taste that same exquisite sense which the Greek possessed. The best architecture is that which makes us feel most and say least.

Bricks and Mortar.

APHORISM FOR THE WEEK.

How very grand it is, and wonderful,
Never have I beheld a church so splendid!
Such columns, and such arches, and such windows,
So many tombs and statues in the chapel.
LONGFELLOW.

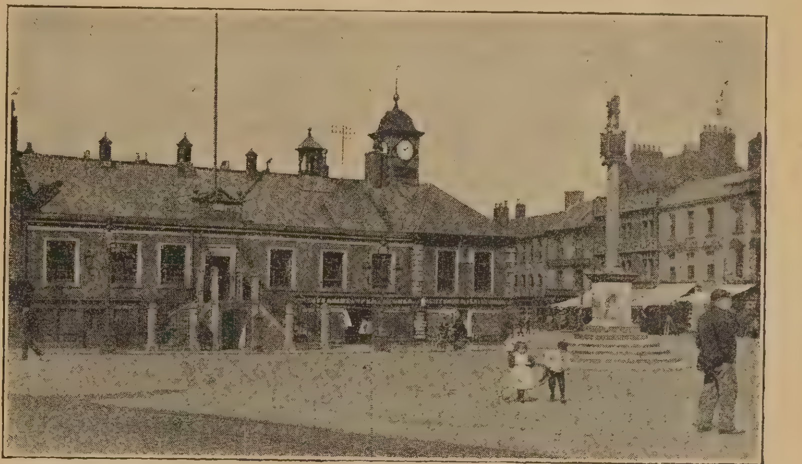
Our Plates. THE buildings of the Royal Infirmary, Glasgow, being quite out of date in their arrangements, are soon to be pulled down and an entirely new group of buildings erected from designs by Mr. James Miller, of Glasgow, whose plans have been selected from those submitted in a limited competition. Of the present buildings the only portion of architectural interest is the front block, of which the drawings in this number show the façade. This facade faces Cathedral Square, and was opened in 1794. It was designed by Robert Adam, the architect, and is a very good example of his work. Although it has little ornament and is very simple in its design, its treatment is quite characteristic, with its three-light semicircular arched windows and its small central dome. Great efforts have been put forth to preserve this facade in its present position, but it is feared it will be entirely cleared away, to the loss of the architecture of Glasgow. The measured drawings are by Mr. D. B. Hutton, who is an architectural student of the Glasgow and West of Scotland Technical College.

Repair of Linlithgow Palace. THE ancient royal palace of Linlithgow is kept in repair by the Crown representatives in Scotland, H.M. Woods and Forests. For some years past a sum has been allowed in the Government estimates for the upkeep and preservation of ancient royal residences, and with this money good work has been done. Recently workmen have been engaged repairing and pointing some of the more needful parts of the old building. In particular, attention has been directed to the wall on the north side of the quadrangle, and the apartments known as Queen Mary's room and the priest's residence. In these apartments the old lintels have been renewed and made more secure. The ancient fireplace in the Queen's room has been strengthened by the construction of an angular iron lintel, and similar repairs have been effected on an adjoining larger room to support the building above the window. In connection with the repairs at this time the Crown authorities have seen fit to erect a strong bulwark at the loch harbour, to prevent the water of the loch from making inroads on the palace grounds. In future years this work will probably be extended on the east side.

Edlingham Church. THE restoration of Edlingham Church, an interesting specimen of early Norman architecture, has been completed at the cost of over £1,000. The alterations and additions include new roof, an improved system of drainage, a new pulpit, a new lectern, new doors and new windows, although it should be mentioned that on account of the great historic interest attaching to the building, and because every stone is beautifully age-stained as well, it was decided to allow each window-opening to remain unaltered, so as to preserve as far as possible the historic memories associated with the church. The floor, which was raised 120 years ago above the bases of the fine Norman pillars, has been lowered to its original level. The nave has been roofed and ceiled with pine, as funds did not admit of oak being repeated. The new seating accommodation, however, is of oak. Mr. A. B. Plummer, diocesan surveyor, Newcastle, was the architect for the nave and tower; Messrs. Gradon & Son, Durham, the contractors; Mr. W. D. Caröe, of London, the architect for the chancel, representing the Ecclesiastical Commissioners, who are responsible for that part of the scheme, and who have executed that portion at their own expense. Mr. Percy Appleby, Newcastle, has been responsible for much carving in connection with the scheme. There has also been placed in the west wall a small mural tablet, of dark-grey polished granite, to the memory of the Rev. Matthew Henry George Buckle, incumbent of the parish, from the studio of Mr. Thomas Watson (D. McMillan & Co.), monumental sculptor, Alnwick.

The Date of Stonehenge. THE date of the building of Stonehenge has been put down to various ages. But it is only since the raising of the immense monolith to an upright position recently that the period during which it was built can with any certainty be assigned. During the excavations for the concrete bedding a large number of neolithic stone implements were found, showing every sign of having been used to cut and square the stones. They had evidently been much used, and when blunted were thrown aside and afterwards used as supports for the stone. There can be very little doubt that Stonehenge was built before the Bronze Age, for stone implements would not have been used had bronze tools been available. The tool markings on the lower part of the stone confirm the hypothesis, and from this it is concluded that Stonehenge was built before 1500 B.C.—Various antiquarian and other societies have communicated with the clerk of the Wiltshire County Council protesting against the enclosure of Stonehenge by a fence of barbed wire, and against a charge being made for admission thereto. The county and district councils are appealed to in order to vindicate the public rights.

An American Opinion of Mr. Brooks. "THE AMERICAN ARCHITECT" considers the late Mr. James Brooks was one of the ablest of modern English architects. "We well remember our first visit to England many years ago, when the top rounds, let us say, of the architectural ladder of fame were occupied by Waterhouse, Street, Scott, Norman Shaw and James Brooks. Naturally, our attention was particularly given to the works of these great artists, already familiar to us from the illustrations in the English professional periodicals. Street's buildings seemed to us just like the drawings, neither more nor less interesting; Norman Shaw's executed work was inferior in attractiveness to the drawings, which leant to it, in many cases, a poetry and picturesqueness which it did not possess in execution; while James Brooks's churches were far superior in charm to the drawings. In the grouping of great masses of wall, whether in brick or stone, even Street was hardly equal to him; and his buildings, so far as we saw them, seemed to us to combine originality and power with affection for ecclesiastical precedent to a degree in which he was rivalled only by Street. When it is remembered that the time of Brooks's activity was also the period of polychrome architecture, when rows of little enamelled tiles were thought to be the correct thing in connection with brick cornices, his boldness in using masonry in great masses seems all the more remarkable, and his work is, in consequence, of particular value to the student."



THE MARKET-PLACE AND TOWN HALL, CARLISLE.

The Town Hall, Carlisle. THERE is a feeling of incongruity about the aspect of the town hall in the Border City, as the visitor looks around and finds modern surroundings on every hand. The late Bishop of London says in his monograph on Carlisle in the "Historic Town" series: "The main streets converge upon the spacious market-place, which followed the triangular shape of the old town, and by its spaciousness bears witness to the importance of Carlisle as a market town. In the middle of it stands the old market cross; and on the north side stands the old town hall, a plain building of the middle of last century (*i.e.*, the eighteenth), showing by its modesty the humility of the burghers of Carlisle at the time when it was built. It is a strong proof of the good sense of their successors that they have resisted the temptation to replace it by a more pretentious structure, and are satisfied with adapting to their present needs this interesting memorial of a homely past." The market dates from the early days of the fourteenth century, if not earlier. The illustration on this page is from a photograph by Mr. F. J. Pape.

ST. EDMUND'S SCHOOL, HINDHEAD, SURREY. NEWMAN & NEWMAN, ARCHITECTS.

Law Cases.

Non-Fulfilments of Contracts: An Aberdeen Case.—Sheriff Henderson Begg has issued his interlocutor in the action of George Duguid, builder, of Aberdeen, against the proprietors of the Station Hotel, Aberdeen, for the balance of his account of the building contract for the Station Hotel. The defence was that the building was not completed within the specified time, and that consequently the defendants lost money. In a letter dated January 21st, 1899, and written to Mr. R. G. Wilson, the defendants' architect, the plaintiff agreed to execute the masonwork of the hotel for £3,879. The specification stipulated that the walls were to be ready for the roofs by July 1st, 1899. The defendants did not accept the plaintiff's offer till February 25th, 1899, so that it was then impracticable to have the walls ready for the roofs by July 1st; in fact, the plaintiff was not put in possession of the ground till May 5th. The sheriff decided in favour of the plaintiff, and ordered the defendants to pay his claim of £688 4s. 10d., with costs.

Copyright in Trade Catalogues.—The case of *Ortzman* v. *Leferer* came before the Chancery Division of the High Court of Justice last week. This action was brought to restrain the alleged infringement of copyright in the plaintiffs' catalogue of furniture. This catalogue is illustrated by special sketches made by an artist, and the plaintiffs found that out of 180 illustrations about thirty-two had been copied by the defendant. They therefore brought this action. Mr. Justice Eady gave judgment for the plaintiffs, granting their injunction, with costs.

Flats and the Smoke Nuisance.—The appeal case of *Queen Anne Residential Mansions and Hotel Co.* v. *Mayor, &c., of Westminster* was recently heard. The building in question which caused the smoke nuisance consisted of 300 sets of residential chambers, or flats, none of which were provided with a chimney, there being a general kitchen. In the basement there were five boilers, used for generating steam, for cooking in the kitchen, for warming the building, for generating electricity, for lighting, and also for the laundry. The boilers were connected with a chimney 168ft. high On behalf of the appellants it was contended that no offence had been committed under section 24 of the Public Health (London) Act, 1891, the chimney being the chimney of a private dwelling-house. The Lord Chief Justice considered that in truth a large trade establishment was carried on, and he thought the decision of the magistrate, inflicting fines of £5 and £5 5s. costs in one case and 10s. in each of two other cases, was right. He was therefore of opinion that the appeal should be dismissed. The learned judges concurred, and the appeal was dismissed, with costs.

Re C. G. Crowden.—An adjourned first meeting of creditors was recently held under the failure of Charles George Crowden, builder and contractor, of Westbourne Bridge Wharf, Paddington. A proposal providing for the payment of a composition of 10s. in the £ to the creditors, claims for £48,261 being withdrawn, was not accepted by the meeting, and a resolution for bankruptcy was accordingly passed. Mr. F. W, Davis, chartered accountant, was nominated as trustee to wind up the estate, with the assistance of a committee of inspection. The debtor returned his liabilities at £48,981, of which £4,952 was expected to rank, and estimated assets £13,969.

Fireproof Staircases: L.C.C.'s "Impossible" Requirements.—In the King's Bench Division of the High Court of Justice last Wednesday the case of the *Consolidated Properties Co.* v. *Chilvers* was heard against a conviction on the prosecution of the London County Council for non-compliance with an order of the Council to provide a fireproof staircase communicating with all the floors of the appellants' premises in Queen Victoria Street, so as to provide means for the safety of workpeople. The County Council notice required a new staircase to be erected from the ground to the top storey, communicating with each floor in a particular way. But the difficulty experienced by the appellants, who were anxious to comply with the order, was that the ground-floor and basement of the premises were let to tenants who were not using them as a factory, and who declined to allow the appellants to interfere with those floors. It was therefore impossible to comply with the order. The Metropolitan magistrate who heard the case at the Mansion House refused to hear evidence on the point, and convicted the appellants, saying that the question whether the appellants could or could not comply with the order should have gone to arbitration. The appellants accordingly submitted the question to two experts, who recommended that a single outside staircase be brought down to the ground floor, and then the two inside staircases be utilised and made fireproof; that all doors should be made to swing both ways; and that all gangways and passages be made clear. Mr. Justice Bingham said that in his opinion the appellants had been convicted for not complying with a notice with which it was impossible to comply. Therefore the conviction ought to be set aside; but as the appellants ought to have asked for arbitration before the matter went before the magistrate at all they ought not to have costs. Mr. Justice Ridley concurred. The appeal was accordingly allowed and the conviction quashed, but without costs.

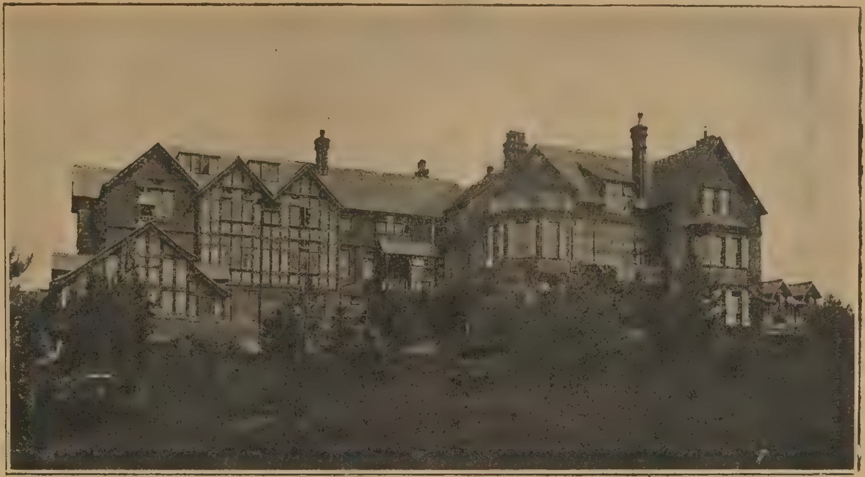
Ancient Lights: Important Appeal Case.—The case of *Warren* v. *Brown* came before the Court of Appeal last Wednesday. The appeal was from an order of Mr. Justice Wright dismissing the action which was brought to restrain an alleged interference with ancient lights. The question raised upon the appeal was whether the right acquired by statutory prescription to ancient lights was a right to the continuance of substantially the whole quantity of light which had come to the windows during the twenty years, or whether it was limited to a sufficient quantity for all ordinary purposes of inhabitancy or business. The plaintiffs' premises, which were situated at Leicester, were formerly used as a boot and shoe manufactory, but during a period of less than twenty years for the manufacture of hosiery, for which it was said delicate modern machinery was employed requiring exceptional light. On the north side of the street facing the plaintiffs' south window the defendant had raised a building from 20ft. 6in. to about 26ft., but had set it back 2ft., increasing the width between the two buildings from 17ft. to 19ft. It was held in the court below that the light had been materially diminished, but that abundant

CHAPEL AT ST. EDMUND'S SCHOOL.

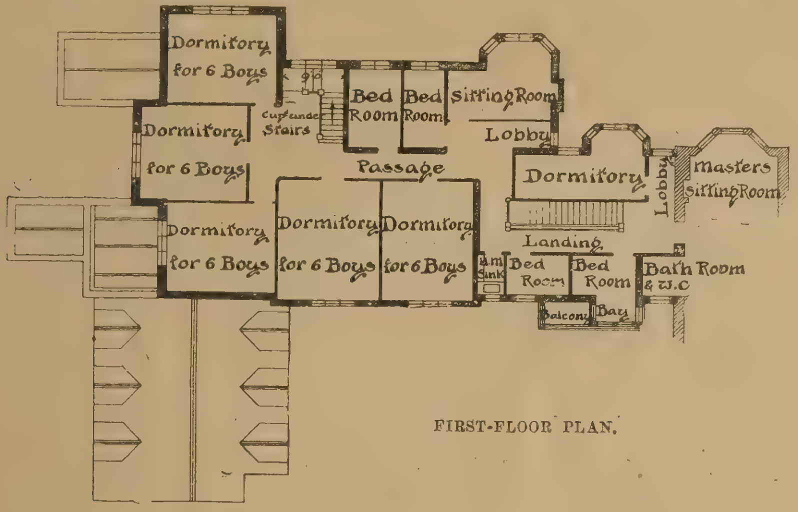
light remained for all purposes of inhabitancy or business. Judgment was given upon that finding for the defendant, with costs, but the learned judge assessed damages, in case he should be wrong in his view of the law, at £100 for the tenant and £200 for the reversionaries. The Court of Appeal held that if ancient lights were interfered with substantially and real damage resulted, the persons injured were entitled to relief. They accordingly allowed the appeal, and ordered judgment to be entered for the plaintiffs for the amount assessed, with costs. (A leaderette on this case appears on p. 239.)

MR. PAUL WATERHOUSE ON ARCHITECTURE AMONG THE MODERN ARTS.

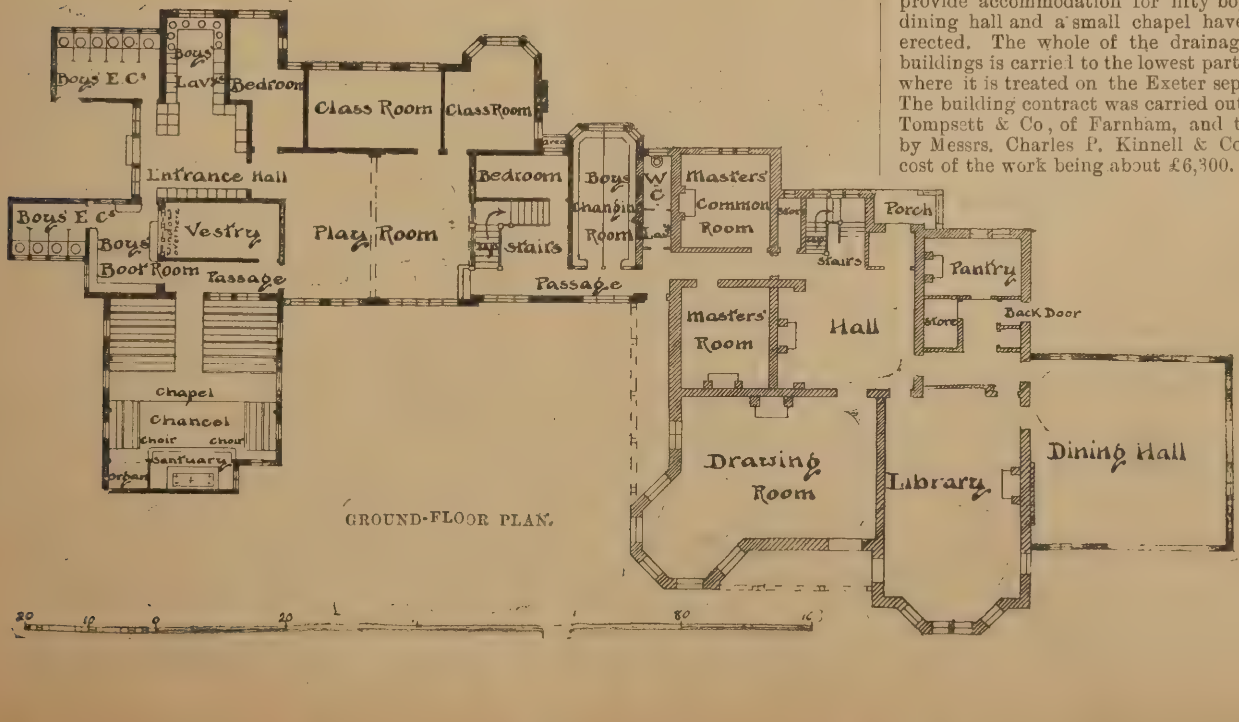
A MEETING of the Manchester Society of Architects was held on Thursday last, Mr. Alfred Darbyshire presiding. There was an exhibition of students' drawings, and the following prize-winners were announced: Design for a small plunge bath, Mr. Gerald Salomons; for the sketches in connection with the summer visits, 1st, Mr. Frank Osler; 2nd, Mr. Gerald Salomons; for measured drawings, 1st, Mr. Claude Paterson; 2nd, Mr. Gerald Salomons. Mr. Paul Waterhouse afterwards read a paper on "Architecture among the Modern Arts." He said he took it to be an axiom that the greatest periods of historic art had been those in which there was no consciousness of art; that, in fact, consciousness in art was a danger to its existence. Our age was above all an age of expression, and in architecture especially the powers which made the critic were, he thought, allied to those which made the producer. In fact, the very mental exercises that enabled us in these days to define and detect that essence of art which was unnameable to our forefathers were not necessarily destructive of creative skill, but might be turned, at least so far as architecture was concerned, into the instrument of a riper, fuller and more intellectual creation. After speaking of the simplicity which underlay Greek art, the beauty of some of the best specimens of Roman architecture, and the last, buildings of the Italian Renaissance, which he said, breathed the very essence of art, the speaker emphasised the fact that art as we understood the word was never talked about by their builders. In the great Gothic days the mason was a skilled craftsman who was imbued with a simple pride in his work, which was to him an expression of pious faith and Christian belief; but the mason would have been quite unable to talk about his work. Until the present age, art was cherished and beloved, but never talked of. To-day an unconscious selection was exercised, but all noble work had its traditions in recognized styles, and was more or less the result of an academic choice. No architect to-day could consider himself equipped for his work without a sound knowledge of the elements in which he worked. So far from being choked, as some argued, by a deeper insight, the architect must necessarily be a student. He attained the highest possible only when he could criticise his own work in the light of knowledge. Architecture was, so to speak, the application of taste to construction; therefore only the man of wide knowledge could be trusted to vary or modify the old rules, since his power to judge depended upon his knowledge of the work of his predecessors. Architecture was creative, and arose from the divine in a man. As its name implied, it was the queen of crafts; the architect was not an imitator, but a creator.



ST. EDMUND'S SCHOOL, HINDHEAD, SURREY.

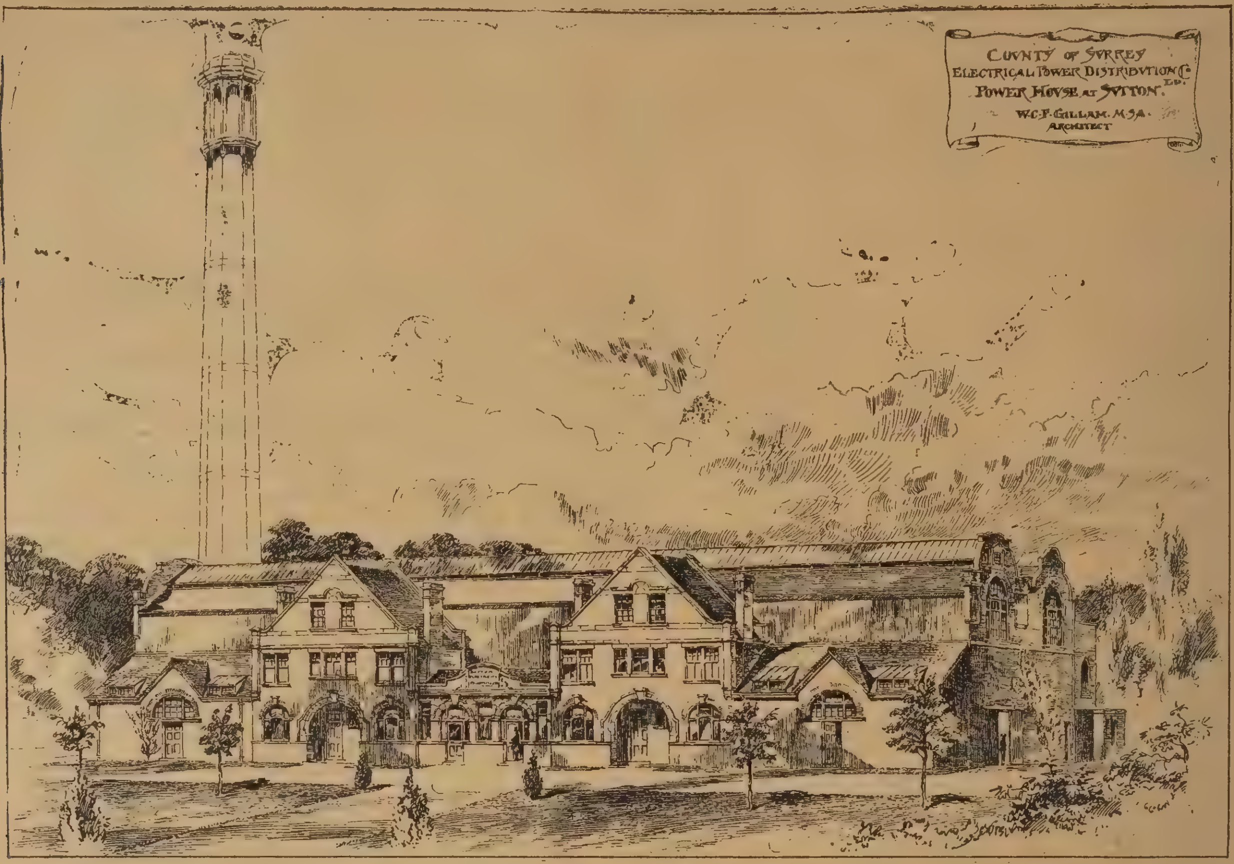


FIRST-FLOOR PLAN.



GROUND-FLOOR PLAN.

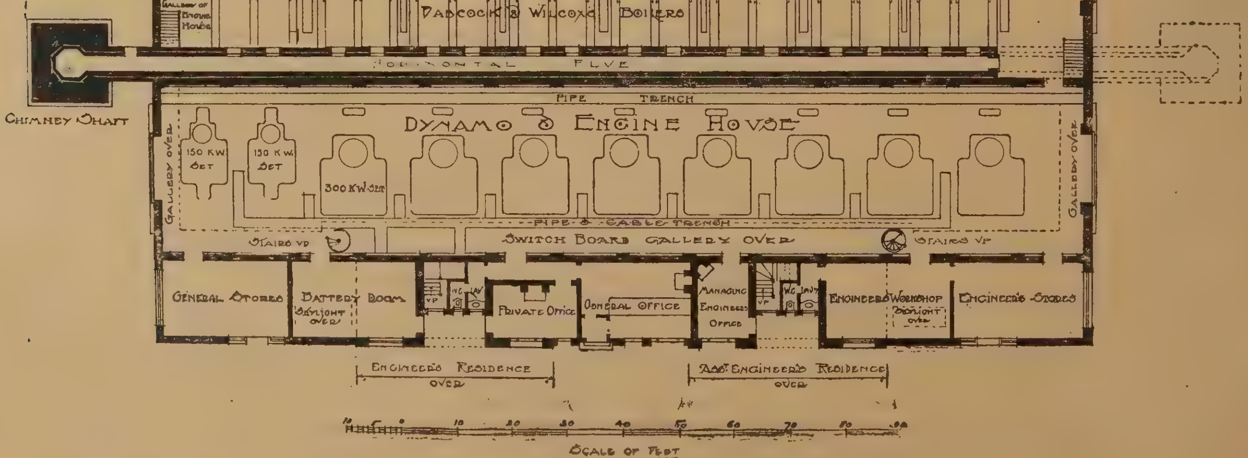
St. Edmund's School, Hindhead, Surrey.—These buildings, which have been erected from designs by Messrs Newman & Newman, of London Bridge, S.E., stand upon a beautiful site about 150ft. above sea-level, and command an unobstructed view of the surrounding country. The existing building, known as "Blen Cathra," has been altered and adapted to suite the requirements of a high-class school, and new buildings have been erected and connected with the existing ones to provide accommodation for fifty boys; a large dining hall and a small chapel have also been erected. The whole of the drainage from the buildings is carried to the lowest part of the site, where it is treated on the Exeter septic system. The building contract was carried out by Messrs. Tompsett & Co, of Farnham, and the heating by Messrs. Charles P. Kinnell & Co., the total cost of the work being about £6,300.



COUNTY OF SURREY
ELECTRICAL POWER DISTRIBUTION Co. Ld.
POWER HOUSE AT SUTTON.
W. C. F. GILLAM. M.S.A.
ARCHITECT

SUTTON ELECTRICITY STATION.

THESE works (the first portion of which is in course of erection) are being built for the County of Surrey Electrical Power Distribution Company, Ltd., and are situated on a site adjoining the south side of Sutton Station (L. B. and S. C. Railway). Electricity will be generated to supply the towns of Sutton, Carshalton and Wallington. The buildings are faced externally with red brick, and the roofs are slated. The engine-house is also faced internally with red brick, with a 6ft. 6in. dado of glazed bricks, whence start the piers supporting the track of an overhead crane. A continuous skylight of patent glazing and windows in the gable ends afford light. The roof trusses are of steel. The floor will be laid in marble mosaic. An iron cantilever gallery is placed on three sides of the engine-house at a height of 12ft. from the floor line, being a continuation of the switchboard gallery, the flooring of which is constructed of patent insulated glass. The chimney shaft is 135ft. high from the ground-floor line, and is octagonal on plan above the square pedestal. The footings rest upon a solid cement-concrete foundation 5ft. thick and 26ft. square. The natural foundation being rock chalk at a depth of 10ft. below the floor level, all walls and the engine foundations are carried down to it. The architect is W. C. F. Gillam, M.S.A., of Brighton.



Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Extensions to Local Sewers.

LIVERPOOL.—LOCAL writes: "A client of mine is anxious to build an expensive house upon an acre of land, fronting a main road in an urban district. The local board's sewer comes within 100yds. of the proposed new house, but the surveyor refuses to continue the sewer up to my client's plot of land. Can the local board be compelled to do so? If not, how is the drainage to be got rid of, as a cesspool is out of the question?"

You cannot compel the board to lay down a sewer in your road. You should ask the local surveyor for advice or get the adjoining owners to bear the expense with you. If you cannot compromise it is optional for you to either lay down the 100yds. of drain at your own expense, or adopt some other method. Cesspools are insanitary. We should think the council would act reasonably if approached properly. Refer to Mr. Max Clarke's paper reported in this issue.

Architects' Assistants' Materials and Instruments.

LANCASHIRE.—P. S. W. writes: "What materials and instruments are architects' assistants generally supposed to use on behalf of their employers?"

Drawing materials, drawing boards and T-squares are provided by the employer, but the assistant must provide his own instruments.

Improving a Water-Supply.

SHREWSBURY.—D. & D-L. write: "In a building we have erected the water is pumped into tanks in the roof by means of a small gas-engine, but this is found to be not powerful enough. The water is pumped from an underground tank fed from a public main having a head of water of about 10ft. above the ground level. It seems to us that the hot-water supply (which is the most important) might be greatly improved by connecting the main to the cold supply from cisterns to cylinder, with a small box on the main containing a flap or other suitable valve to prevent the water pumped into the tank from falling to the level of the head of water in the main. The idea is to get the water-supply directly from the main in conjunction with that from the tanks in the roof, thereby increasing the hot-water supply. Is this practicable?"

If the effective head of water in the main pipes is only 10ft., it is impracticable to connect direct to the hot-water supply, which has more than 10ft. head, even if the water company would allow it. Making the connection at a lower level to let the water run in is against the laws of hydrostatics. The only reasonable method is to increase the size of the gas-engine and roof-tanks. HENRY ADAMS.

Books for S.K. Examinations.

LONDON.—STUDENT writes: "What books would you recommend to study for the South Kensington examination in architecture?"

"A History of Architecture," by Banister Fletcher and B. F. Fletcher (B. T. Batsford, price 21s. nett); "A History of Gothic Art in England," by Edward S. Prior (George Bell & Sons, £1 11s. 6d. nett.); "Rational Building," a translation of the article on Construction in Viollet-le-Duc's Dictionnaire (Macmillan & Co., 12s. 6d. nett.); and "The Column and the Arch," by W. P. P. Longfellow (Sampson Low, Marston & Co., 10s. 6d.).

L.G.B. Model By laws.

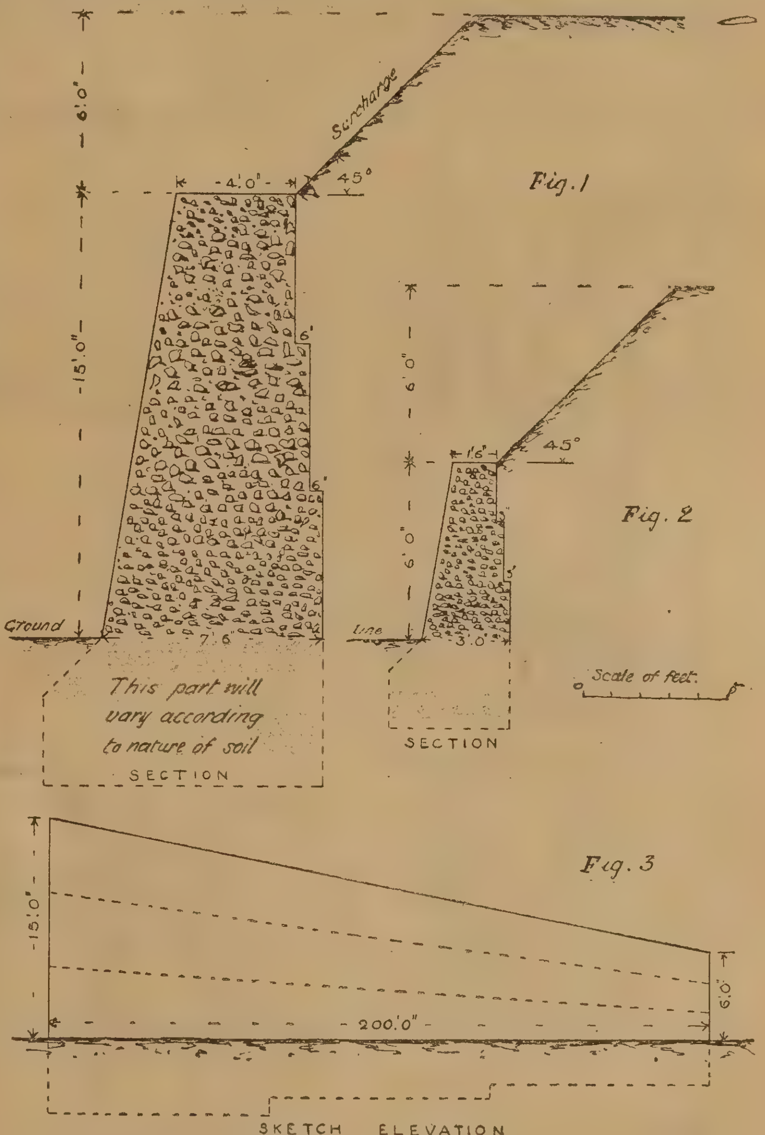
UPPER WARLINGHAM.—A REGULAR READER writes: "Where can the Model By-laws of the Local Government Board be obtained?"

From Messrs. Eyre & Spottiswoode, East Harding Street, E.C., and 32, Abingdon Street, Westminster, S.W.; Oliver and Boyd, Edinburgh; or E. Ponsonby, 116, Grafton Street, Dublin.

Concrete Retaining Wall.

BRISTOL.—EXON. writes: "A concrete retaining wall about 200ft. long has to be built. It would be 15ft. high at one end and 6ft. at the other end. The earth to be retained is of a moist vegetable character, and would be surcharged at an angle of 45 degs. Kindly give sections and method of construction. Please also say how the cost would compare with rough bricks in cement (Bristol district)."

The nature of the subsoil is not mentioned, nor the height of surcharge, and this will considerably affect the design, but the accompanying sections may perhaps suit the case if the concrete be carried down to a firm stratum as shown by dotted lines. Square weep-holes, 3in. by 3in., should be cored in the wall at the rate of 1 to every 4 sq. yds. of face area, or at greater intervals according to the amount of water percolating through the soil supported. The sketches show the sections at the two extremities of the wall, and a sketch elevation. The construction would be similar to ordinary concrete work, the mixture being say 1 Portland cement, 1 sand, 5 or 6 broken stone or ballast. The cement to be thoroughly air-slaked and all of one make and quality. The cost would probably be from two-thirds to one-half that of rough brickwork. The description does not say whether the top or the bottom of the wall is to be level; the latter has been assumed, but the dimensions will answer for either case. HENRY ADAMS.



CONCRETE RETAINING WALL.

Damage to Roof by Storm.

SURVEYOR writes: "Suppose a portion of a lead roof was torn up by the wind during a storm, would the contractor be required to make good the damage at his own cost, after the building was taken off his hands and the work passed by the Inspector of Works, if a clause was inserted in the schedule 'that the contractor must uphold the work for the period of one year after completion.' Does that include all risk of storms?"

Yes; the contractor would be liable to repair the damage at his own expense.

Designing Ironwork.

PORTSMOUTH.—C. F. S. L. writes: "Which is the best work on the practical designing of constructional iron and steel work, also of domes, cupolas, &c.? Where could I find how to obtain the 'resistance figure' and centre of gravity of any section, regular or irregular, both graphically and mathematically?"

"The Practical Designing of Structural Ironwork," by Prof. Henry Adams (7s.). A paper on domes by Sir Edmund Beckett (then Mr. Denison) will be found in the "Memoirs of the Royal Institute of British Architects," of February, 1871, and two shorter ones by Mr. E. W. Tarn in the "Civil Engineer's Journal" of March, 1868. See also Sir E. Beckett's "Book on Building," Lock's "Elementary Statics" (Macmillan & Co., 3s. 6d.), Hoskins' "Graphic Statics" (Macmillan & Co., 10s.), and Rankine's "Manual of Applied Mechanics" (Griffin & Co., Ltd., 12s. 6d.). These can be obtained from Mr. B. T. Batsford, of 94, High Holborn, W.C.

Staircase Construction.

FILEY.—M. F. S. writes: "What is the best book on staircase construction?"

"A Treatise on Stairbuilding and Handrailing" by William and Alexander Mowat (George Bell & Sons, price 28s. nett).

R. I. B. A.

Mr. ANNING BELL ON MOSAIC.

A MEETING of the Royal Institute of British Architects was held on Monday evening last, Mr. William Emerson, president, in the chair. Mr. Alexander Graham, hon. secretary, announced the death of Mr. Frederick William Porter, district surveyor of Holborn and East Strand, elected a Fellow of the Institute in 1855. Mr. Robert Anning Bell then read a paper on "The Practice of Pictorial Mosaic." The following is a summary:—Mosaic had many advantages peculiar to itself, and also had very definite limitations. It was obvious to anyone who had studied the work of the past that the realistic representation of natural effects, although it had been sometimes remarkably near success, was not the way to get the greatest beauty possible out of the material. The material proclaimed itself at the outset as being unsuitable for realistic effects for two reasons. The first and strongest was the uniformity of its surface, which rendered it impossible to get that variety in the texture of the material which was the special reason why oil paint was so triumphantly superior to any other material in the rendering of the look of Nature; the second, the fact that it had to be applied in separate pieces, with an interval, however small, between them. The tints could not shade off into each other with quite the subtlety of paint, and the interstices formed a lacework of ground colour and shadow which was the same all over the surface, and added to the monotony of the texture. The material, therefore, commanded a certain flatness as the effect to be aimed at, and, as a corollary to this, a certain archaism or stiffness in the design. This very flatness of effect imposed some restraint on the style of the design. It was not truly archaic, but was the fullest expression which the limits of the material permitted, and gave an artist plenty of elbow-room for his invention if he had any feeling for the method. For pictorial mosaic the subjects chosen must be such as aré suitable to austere treatment. The play of facial expression or momentary gesture was out of court. The characters introduced could not be likenesses, or the occasion of their introduction a mere incident; the characters should be types, the incidents symbolic.

Discussing the practical questions of working and placing the mosaic, the author said that it should be some way from the eye, and a good deal higher up. Like many other good things, when you want it you want a lot of it; it is best of all when entirely covering a large space and unbroken by architectural mouldings. This applies more particularly to gold mosaic, which, when covering walls and domes, running round the arches, flashing into a glistening flake of light as it turns the corner, and covering every inch of space above the capitals of the columns, is much more satisfactory in effect than when used in juxtaposition with stout arch mouldings and pilasters. Small panels of mosaic, the author said, he did not like at all, even where they are merely filled with conventional foliage, though that is better than the clumsy look of small figures close beside the smooth and exact form of the mouldings which frame them.

In interior work, gold mosaic—a treatment, that is, in which gold is largely employed—seems to be infinitely superior in effect to a treatment in colours only. For external work the author considered the use of gold a mistake. First, from the practical side, owing to the construction of the tesseræ, it was likely to be damaged by frost, as the film of glass which covered the gold-leaf was very easily flaked off should any water get into the interstices, as it was sure to do; and secondly, from the æsthetic side, there was no mystery of shadow to bring out its peculiar beauties; it glittered so strongly in sunshine as to destroy the effect of the design of which it formed part, and it was inclined to look rather garish even in ordinary daylight.

Treating of colour, the author advised a light scheme of colour as preferable to a deep one. The cooler colours are pleasanter than the warm ones when used in any quantity. Much orange is peculiarly unpleasant, and even reds should be sparingly employed, and rather as accents to strengthen other colours than in masses for their own sakes. Blues and greens tell well at a distance; they have a charming quality, will keep their colour very fairly, though one needs to use a much stronger blue than might be expected if it is to be at all rich in effect. It may be taken as a general rule that differences of any light tints carry much further and tell much more strongly at a distance than similar differences in a lower key. In whites a very slight difference will have a very marked effect, and it will tell less close to than some way off, whereas quite the opposite is true of strong colours, particularly of red. Difference of quality in the glass has also a marked effect on its carrying power.

As regards tesseræ, very great differences of size are unadvisable in figure-work. A few large pieces among a lage number of small pieces is unsatisfactory. If, however, large pieces are mainly used, a few small pieces here and there will rather enhance the effect. As an interesting example of this, Mr. Beresford Pite's mosaic outside Pergami's Restaurant was cited. The effect is quite unlike what we are used to in mosaic, but the author would like to see more work done in this method. It has many advantages in a place like London. Dirt cannot easily settle on it, and when it does is easily washed off. It is permanent; and as the pieces are so large, less labour is required than with ordinary mosaic. For outside work the author found that a scale larger than was generally seen in old work might be used with good effect. Should varying sizes of tesseræ be used generally over the work, any place where they are kept of uniform size will infallibly attract the attention by its regularity; this would be seen in a pilaster forming part of the background of the panel at Horniman's Museum.

Careful study should be given to the size of the interstices. In background work they can be quite large if the colour is not wanted to be very pure, the dull tint of the putty toning down or saddening brighter colouring. In such parts as faces, hands or other details to which particular attention should be attracted, they may be quite close together, so making a comparatively solid mass of colour and giving emphasis to the part. In fact, it would be difficult to work a face without keeping the tesseræ close, as the tone of the interspaces would destroy the quiet modelling, which is all that is necessary or advisable.

Remembering the limitations of the material, anything like truth of relative values or strength in the general effect of light and shade should not be attempted. Simplicity in modelling is to be desired. Variety of tone is obtainable by the relative strength of the colours used in different parts of the design. Realism of texture in draperies or other accessories should be avoided; trees, buildings, clouds, textiles, &c., should be felt to be rather symbols of those things than actual representations of them.

The author then treated of various matters and difficulties connected with the actual work of putting the mosaic upon the wall. His preference was for the method of doing the work *in situ*; a good result cannot possibly be obtained by other means. The modern Italian way, which the author described, is open to the obvious objection that you cannot see the progress of the work, and it is impossible to make alterations as you go on, as the surface is too flat.

In translating the water colour or pastel tints of the cartoons into coloured glass, a good deal of variety is possible, so that it is necessary to be always in touch with the workers to discuss with them which tint and quality of glass shall be used, and sometimes to vary from the cartoon when the work already finished may suggest it. The setting of the mosaic is an essentially artistic craft; it is absurd of the designer-in-chief to say simply: "Here is my cartoon; take it and copy it exactly." It is impossible to copy it anything like exactly, and consequently complete co-operation between designer and craftsman or craftswoman—for it is one of the things that women do admirably—is absolutely necessary.

Though the most splendid, as it is the most permanent form of wall or ceiling adornment, mosaic is extremely arbitrary, and any attempt to stretch its limits is terribly punished. It will not easily put up with rivalry, and will not endure other methods of decoration in immediate juxtaposition. In interior work it quarrells with staired glass, and it destoys gilding, as may be seen in many a Roman church where the choir-arch and columns are gilt around an apse of mosaic. Outside, the mosaic must be made the dominant in the scheme of which it forms part. No colour can stand near it but in humble subordination, and its surface texture requires considerable art and discretion in the choice of neighbouring materials. Nobly used, it nobly repays; ignobly need, it does nothing but disgust.

Mr. George J. Frampton, A.R.A., in proposing a vote of thanks to Mr. Bell, said mosaic should be light in tone and flat, without strong black colours or tones, or it would look like a hole in the wall. Realistic treatment should not be used in decoration, and realism could not be used in a building; what was wanted in decoration was the mind of man, set forth in conventionalities.

Mr. Walter Crane seconded the vote, and Messrs. C. Harrison Townsend, T. R. Spence, George Bridge, W. Brindley, William Woodward, Edward W. Hudson, Thomas Blashill, Colonel Lenox Prendergast and Mr. William Emerson also spoke. Mr. Bridge said architects often assumed a depth of about 3in. was necessary for placing the mosaic, but, inclusive of cement (or putty) and tesseræ, it would not be more than 1in. thick. The putty was put on about ½in. thick and the tesseræ pushed in, squeezing it up between, and about ¼in. was finally left behind them. The chief basis of the putty he had used was lime and boiled oil, but the great thing was to see that the lime was old, say two or three years. The vote of thanks having been accorded, Mr. Bell replied, and the meeting then terminated.

CAMBERWELL'S MUNICIPAL DEPOT.

A NEW depot for carts and horses has been erected for the Borough Council of Camberwell in Grove Vale, by the side of East Dulwich Station. It is approached by a roadway 185ft. long, and is distant from the northern extremity of the borough 1¾ miles, and three miles from the southern boundary, which is at the Crystal Palace. It covers 1¾ acres of ground, of which the freehold was purchased in 1898 for £1,500, and encloses a small plot 29 poles in extent used for the storage of materials for road-making, &c. The total cost of the new buildings and machinery will be just under £30,000. The buildings, designed by Mr. Oxtoby, the borough engineer, have been erected by Mr. Holloway, of Deptford, and are throughout fireproof. They are in five blocks. The first of these contains a committee-room, a harness-makers' shop, store-rooms and offices, with a steam-roller house and two cottages for the horse tender and the storekeeper. In the next block is the greater part of the machinery. Here are workshops for wheelwrights, farriers, and smiths, and on the floor above rooms for painters and carpenters. In future the borough will make all its own wheels, and perhaps its carts. Then comes a large three-storeyed block in which the newest machinery cleans, cuts and mixes the food for the horses, dividing it up by weigh and putting each ration into a separate bag. In an hour and a half the food for 120 horses can be prepared. Close by, over the yard, is a large platform, to be used to store timber, &c., while carts will be kept underneath. A hydraulic lift, with a lifting capacity of two tons, will raise carts, &c., to the higher level to be painted and mended. At the very back, but communicating with the exit by a wide roadway running under the various blocks, are the stables, in which there are stalls for eighty-eight horses, eight of the loose boxes being arranged for animals that may be diseased, and completely isolated in case of infection. Close by is a veterinary's surgery. Forty-four animals occupy the first floor, reached by an incline.

THE ARCHITECTURAL ASSOCIATION.

SANITATION OF A COUNTRY HOUSE.

By MAX CLARKE, A.R.I.B.A.

A MEETING of the Architectural Association was held on Friday evening last, the chair being taken by Mr. G. B. Carvill, vice-president. After the minutes of the last meeting had been read and confirmed, the following gentlemen were elected members of the Association: E. S. Barr, J. C. Bucknill, F. Bisset, W. J. Deldridge, J. H. Goodchild, C. L. Hampton, G. O. Howship, A. S. Jones, E. J. Kallenborn, E. G. Millar, D. W. Pollock, E. Pitt, H. Sandford, W. J. M. Thomasson, A. H. Whyte and E. H. Walker. Mr. R. H. Weymouth was then nominated for the vacant seat on the Committee created by the retirement of Mr. Arthur T. Bolton to take up his position as headmaster of the Day School. The chairman announced the following donations to the new Premises Fund:—

	£	s.	d.
J. Macvicar Anderson, Esq.	250	0	0
The late Arthur Cates, Esq.	250	0	0
Henry L. Florence, Esq.	250	0	0
Arnold Mitchell, Esq.	200	0	0
Aston Webb, Esq., A.R.A.	200	0	0
E. A. Gruning, Esq.	100	0	0
Alfred Waterhouse, Esq., R.A.	100	0	0
Paul Waterhouse, Esq.			
A. Bramwell Thomas, Esq.	52	10	0
William Emerson, Esq.	50	0	0
T. M. Rickman, Esq.	50	0	0
W. Howard Seth-Smith, Esq.	50	0	0
The late William Young, Esq.	50	0	0
Reginald Blomfield, Esq.	25	0	0
G. H. Fellowes Prynne	25	0	0
A. E. Street, Esq.	21	0	0
Walter Emden, Esq.	5	5	0
W. L. Traut Brown	5	5	0
Total	£1,6 4	0	0

Mr. Max Clarke, A.R.I.B.A., then read a paper on "The Sanitation of a Country House." After referring to the definition of "hygiene" and "sanitation," and citing two specific cases illustrating the responsibilities of architects in regard to sanitation, the lecturer spoke of the sanitary requirements of a house. He said:—

The lie of the ground and the drainage of the subsoil (if such is required) require most careful consideration, always bearing in mind that it is better to lay land drains so that they will convey water away from the house than towards it. Land drains or agricultural pipes are liable to get blocked up at times, and this should be borne in mind when laying them.

The foundations should receive careful consideration even in the country, taking care in a clay district to carry them well down beyond the level which may be affected by droughts. Let me remind you that Portland cement requires more examination and attention than it usually receives from architects. I find it very difficult to get it sufficiently air-slaked—or, in other words, it is as a rule used when it is too fresh; it is more likely to blow or expand when used fresh, accounting for the number of fractured stoneware-pipe collars which are to be met with.

Damp-Courses over Area of Buildings.

Covering the area of buildings with Portland-cement concrete, as required by many authorities, is for the purpose of keeping down ground damp, which, where there is no concrete or other damp-proof course, is liable to be drawn up in the building when the latter is heated, the damp or noxious gas sometimes coming from great distances where the earth is light or porous. In this way sewer gas may be brought into a building from defective sewers existing at a considerable distance. In order to prevent this, care should be taken that the cement is sound and slow-setting, and that the concrete is not porous, the aggregate not being too large, such for instance as brickbats, which one often sees in concrete. The surface should be well beaten down and smoothed over with a shovel so as to form an impervious face, even if the concrete is only to act as a damp-proof course and not as a floor.

Damp-Courses.

Damp courses in walls should receive great attention. The very old-fashioned clause to be found in specifications, "Two courses of stout old slates bedded in cement," should, I suggest, be abolished, as it is most difficult to get stout slates, either old or new. Asphalt often suffers from being laid upon the walls and then used as a gangway by the men on the works, or is otherwise damaged by moving materials upon the walls before the brickwork is continued up over the damp-course. Whatever the material may be, it should be carefully protected until the superincumbent walls are built. In connection with damp-courses and floors, I doubt if sufficient attention is paid to cases where there are wood floors with a space under one side of a wall, and tiles or mosaic with concrete under at the other side. Then some precaution is required to prevent the damp getting from the earth and concrete on one side of the wall to the flooring and timbers on the other side. Numerous methods can be adopted, but they are usually conspicuous by their absence.

Vertical Damp-Courses.

Vertical damp-courses or dry areas are most important to rooms underground. I do not think there can be any doubt that where a wide area cannot be obtained, covering the external face of the walls with a double thickness of asphalt is the very best means of keeping out damp, the asphalt forming a horizontal damp-course at the bottom and extending vertically above the level of the surrounding earth. My experience of hot compositions poured into a cavity in the wall is, that such care is necessary to prevent mortar-droppings getting down, and to ensure the hot material getting down and adhering to that already in, I shall not risk it.

Ventilation under floors should be attended to, sleeper walls being built open to allow of currents of air through the open spaces. One forgets at times that putting in an air-brick to the space under one room, and carrying up the brickwork close under the floor all round without any openings other than the one, is not "ventilation"; it is only leaving a hole. All holes made in walls should have a fall outwards to prevent wet being driven in.

Bedding wall- or pole-plates in main walls at the ground level is a mistake. They should always be carried on corbels, piers or independent walls. In connection with this, I think hoop-iron, well tarred and sanded, is to be preferred to wood wall-plates.

Walls.

With regard to walls, what shall I say? That you should avoid, if possible, using 9in. walls. It is not sanitary work, in my opinion, to build a house costing, say, £2,000, with all the outer walls of 9in. brick; and particularly when the bricks are porous, as so many are nowadays, put together with poor mortar, and not even damped before laying; if the last is not done the dry brick absorbs all the moisture out of the mortar so rapidly that the material is little better than dust or dry mud. Hollow walls require attention to see that the cavity extends below the level of the internal damp-course; also that mortar is not allowed to drop down the cavity and rest on the wall, thus forming a means for the damp to pass from the exterior to the interior lining of the wall. The lead covering of lintels or arches over openings in hollow walls require attention to ensure the ends of the lead being welted and turned so as to direct the moisture to the outer wall.

I have had some experience in building with granite, and I find it is a mistake to allow through or bond stones to extend to the inside face of the wall, as damp patches are usually found where the ends of these stones come. This is, of course, where neither brick lining nor "strapping" (the Scotch term for battening and plaster) are used.

Roofs.

Some points in roofs require attention, one of the most important, to my mind, being in cases where eaves-gutters rest on the tops of walls or on oversailing courses. It is a practical impossibility to make a cast-iron eaves-gutter perfectly watertight; therefore short lengths of lead should be fixed on the top of the walls at each joint in the gutter to take the water which escapes from the joints away beyond the face of the wall, not allowing it to percolate into the brick and stone and so form a very unsanitary spot, as well as an eyesore on the inside. These pieces of lead should be welted at two edges, and of the other two edges the back should be turned up and the front edge turned slightly down where beyond the outer face of the wall.

Down Pipes and Soakers.

Down pipes are as a rule too large and too numerous in most buildings, where gulleys have to be fixed at the bottom of each stack, involving unnecessary drains and extra work clearing out, &c. The pipes should always be fixed so that they are clear of the walls in case of leakage.

I would suggest that "soakers," which are more usual in the North than in the South, are better in every way than either secret gutters or flashing, the cover flashing being less liable to damage than flashing laid on roof slates. Soakers also make a good finish to hips where the taste of the architect does not permit of hip tiles, slate, or lead coverings; the slates can be cut to a close joint down the angle. Slates of a greater width than the ordinary size should be used in these positions, so that no very narrow strips or small angle-pieces are used, as they usually have only one nail or peg and are very liable to get broken and fall off.

I think two courses of slating battens, the lower one vertical and the upper horizontal, is a good method of obtaining an air-space in roof construction, and so rendering the interior less liable to be affected by changes of temperature. Felt should be clearly specified and examined as to quality; the cheapest, which is often seen on work, is not a desirable article.

Silicate cotton or slag wool is a most admirable non-conductor as well as being a sanitary material to be used in almost all cases where hair-felt is so often used, the latter being a happy hunting-ground for all sorts of vermin, whereas the slag wool is to them most objectionable.

I need hardly refer to the fact that the common floor with wood joists, floor boards and ceiling plastered is not a "sanitary" floor, but it will be some time yet before we can get a solid floor of any sort used in country houses even of the better class. With regard to partitions, I think the stud partition, of "quartering" plastered both sides, should be consigned to the past; porous and pumice bricks, breeze-concrete, perforated and solid plaster slabs and solid plaster on expanded metal, are all so much superior that their use should be universal even in country houses. As to the prevention of "dry rot," I would advise you to avoid any heating system which combines heating and a supply of hot water for domestic purposes, unless the former be of the most limited description.

Windows.

High bottom beads or rails to double-hung sashes as a simple inlet for air are not made use of as often as they should; they also form a very excellent stop to prevent wet coming in at these points when heavy gales blow directly on windows. A splayed notch on the outside of the bottom bead is an additional safeguard against water, but do not cut the notch upside down, as illustrated in a well-known work on specifications—evidently a slip, but still liable to be copied by the beginner.

I think we may now turn to the matters which are more usually known as sanitary. Presuming all things are in order, we shall now consider the fittings and drains.

Water-Closets.

Taking water-closets, I should advise in all cases a wash-down or pedestal basin, and in saying this I know I lay myself open to criticism, but I have been through all the points of noise and flush and non-cleaning and comfort and habit, and all the rest of it, and am still of the same opinion. As to the particular type I shall not say much. I think it should not be what is called "large area" water-surface; I do not think the clearing of these is at all satisfactory, even with flushing cisterns of larger capacity than we are allowed to use in London as a rule.

I also think the basin you select should have the most simple joint to the soil-pipe that can be obtained, consistent with perfect water-seal or air-tightness, depending upon the position of the joint. The back, of course, should be straight, and the flushing rim, if it is of that variety, should allow a good body of water to fall all round. Seats should always be of hardwood in two thicknesses, preventing warping and cracking

The water-closet should be fixed so that the flushing cistern can be placed immediately over the inlet arm; the old-fashioned position back to a window is the worst for a water-closet worked with a W.W.P. or flushing cistern. The seat should either have rubber bosses fixed on the underside or iron bearers projecting from the wall, leaving the floor clear for sweeping; the hinges should be brass pivots and plates fixed to the edges of the seats at the side—not butt hinges, which are very usual. Every water-closet basin should be white; printed basins hide dirt.

One point in connection with the W.W.P. which does not receive the attention it deserves is the rate at which it fills. I put in specifications that it is to fill in a minute and a half, which means that with a low head of water a ¾in. ball valve must be used; and as this costs a little more than a ⅜in. ball valve, it is not always used when it should be.

As far as my experience goes a perfect flushing cistern has yet to be invented, so I shall not offer you any advice upon the sort to use, except that the fewer the working parts the better. The shell if of cast-iron should always be galvanised; wood shells lined with lead are best in some situations, both on account of quality in the water and because they are not so liable to damage from freezing. I think a chain, or for the better qualities a brass rod, *not* in a slide, the best form of pull. A stop-cock on the water-supply to each flushing cistern is an advantage when repairs are needed. The position of the arm for connecting the anti-syphon pipe is of some importance, and the method of connecting the pipe to the arm when the latter is of any stoneware type is a difficulty sometimes not satisfactorily dealt with; therefore, as the best way out of the difficulty, I am inclined towards a lead trap to which the anti-syphon pipe can be wiped.

If a valve closet must be fixed, use a good one. A lead tray should always be fixed under cheap valve closets in case of leakage, with a weeping-pipe to the outer air having a copper flap at the end to prevent wind blowing up the pipe; and the same applies to the overflows from all cisterns and flushing-tanks. Care should be taken to make the wood fittings in connection with these water-closets easily movable and clear of plaster-work, &c.

Baths.

As to baths, whether porcelain, cast-iron or copper be used must always be a matter of individual taste; the first-named is always difficult to heat if a hot bath is required. Copper is the best in this respect, but a good one is always expensive, and requires stout cradling to prevent it being put out of shape.

The bath fittings should, in my opinion, be of ample size, so that the bath can be filled rapidly, and I favour valves or taps which are quite distinct, the hot supply from the cold, and the nose projecting well over the edge of the bath if not actually inside (which is a modern improvement), very useful in case the valve leaks at the stuffing box or union. Lead safes are useful where the baths are enclosed, but the best type of baths do not require enclosures, and with these lead safes are unsightly. A tile or mosaic floor is preferable, or perhaps a sunk marble slab if funds will permit.

The waste-pipe should, in my opinion, discharge into an open head outside, so that the traps may not be syphoned out. I think this a better method than having long continuous wastes fitted with anti-syphon pipes.

Lavatories and Sinks.

The number of lavatories and sinks from which we can select is so large that all tastes are catered for. Those having complicated fittings should always have lead safes under, in case of leakage. Enclosures are to be avoided, as they become receptacles for dirt and objectionable things in general. Every fitting of this nature should have a proper overflow. I have had considerable trouble with sinks for hot-water washing-up in cases where glazed ware was unsuitable, and have tried wood lined with lead, zinc and tinned copper, but they all proved practically useless in a very short time in cases where there was much washing-up to be done with hot water, 2in. teak put together with red lead, galvanised bolts and brass screws being the only form of sink suitable for this class of work; in this case I have had the waste plugs made hollow and of sufficient height to form an overflow. Care should be taken to have a proper grating in the waste washer, which can be removed but not *too* easily taken out, otherwise it is never in its place and pipes get blocked up. Except in large houses I consider that a water-closet should be used for emptying the slop-pails into, but when a slop-sink is required it should resemble a water-closet, not have a grating or anything of that nature to the outlet; the latter are only suitable for fixing under hot or cold draw-off taps, which should be provided in the housemaid's closet. If a real slop-sink is provided it must be fitted with a ventilated soil-pipe and anti-syphon pipe, exactly as a water-closet would. All sinks should have high backs or some other means of preventing the wall or enclosure from getting wet.

Traps,

usually of drawn lead, should be fixed under all fittings, with brass cleaning screw, the latter having a square or oblong projection for unscrewing—not a couple of small holes, or an indentation requiring a special tool to unscrew it. Connections between fittings and lead-pipes should always be made with "unions and fly-nuts." I shall only direct your attention to one other point in connection with fittings—the word "self-cleansing," now in such common use. It would be well if all architects, and, indeed, their clients also, would understand that this term does not mean that the particular fitting will keep itself clean, but that there are no corners or angles or the like where dirt can accumulate.

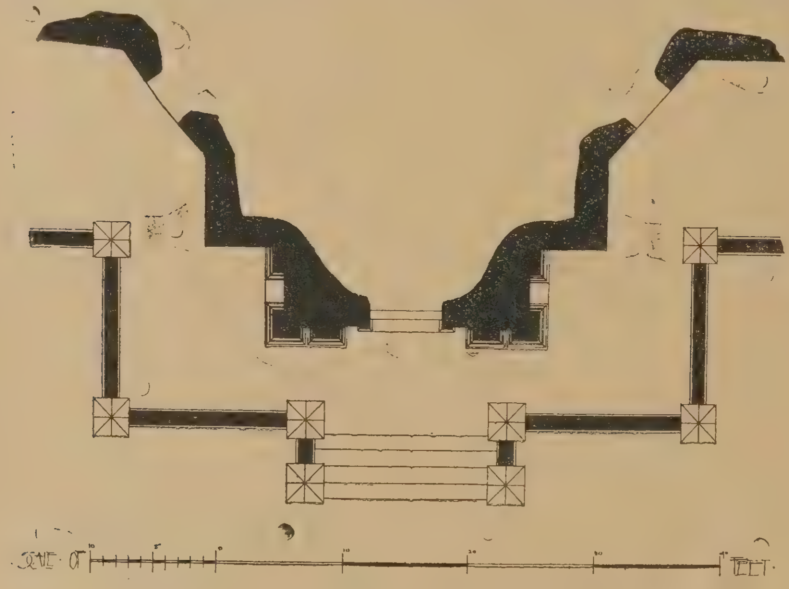
Water-Pipes.

Pipes for water service should be considered with regard to the nature of the water, particularly in some localities where both the water and the earth may cause deterioration of lead. I show you a piece of lead-pipe taken from a house near Bedford some time ago, the exterior eaten away by some action of the earth in which it was laid; some hundreds of yards had to be renewed in this case. I laid some lead-pipes in the neighbourhood in trenches which were filled with sand and gravel, with which the pipes were surrounded to prevent damage from the above cause. Lead lined with tin, or iron lined with glass, are very good, but are expensive, and the former require special joints.

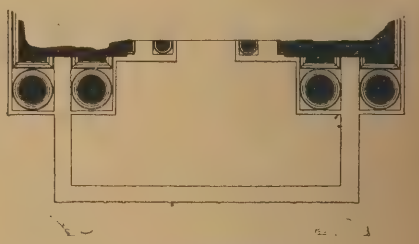
Cisterns.

The storage of water is, of course, a debated point. Personally I am for storage, as I consider it can be carried out with very little fear of contamination. In a country house a supply of water for drinking and cooking purposes can be stored in a glazed stoneware tank (if a slate or galvanised iron one is not considered good enough). The general supply can be stored in a galvanised wrought-iron cistern, or cast-iron, or steel plate. If the size is large the wrought-iron should never be less than ⅛in. thick; many are so thin as to be useless in a very short time. I have found it an advantage when a galvanised cistern is used to have it thoroughly cleaned out when all the connections are made, and then to paint the insides twice with Portland cement mixed with water to about the consistency of paint; this preserves the galvanising and covers many of the little projections left in the process.

I need hardly remind you that close-fitting covers to the cisterns are essential; that the cisterns should if possible not be placed where the water is liable to freeze in cold weather. Near a chimney is a good position, other matters being equal. Safes under are always advisable in case of accidental overflow.



PLAN OF ENTRANCE.



PLAN OF BALCONY.

THE ROYAL INFIRMARY, GLASGOW. MEASURED AND DRAWN BY DAVID B. HUTTON.

The position of outlets deserves attention. They should always be in the side of the cisterns, so that dirt cannot get down the pipes; and if a supply is taken off for hot water it should always be taken out of the cistern below the general cold-water supply, otherwise in times of scarcity there is danger of leaving the hot-water system without water. One further point with regard to cisterns. There are some on the market which are intended for use as a reserve only, the supply under ordinary circumstances coming direct from the service-pipe and not passing through the cistern. I am not in favour of this arrangement, as the water might be in the reserve for so long a period that its use might be undesirable.

Soil-Pipes.

I think we may turn to the soil-pipes and drains, dealing with the former first. Naturally lead is the most suitable material, except in cases where large quantities of hot water alternating with cold have to be dealt with; under these circumstances cast-iron is more desirable, as the lead is buckled and at times cracked by the alternate heating and cooling. The connection of the foot of the soil-pipe to the drain is often not carried out as it should be; if the soil-pipe be of 3½in. diameter (and there is no necessity for it to be larger) the brass tail-pieces usually sold have such a narrow

flange that it will not bear on the collar of the pipe, but slips right down; a wide flange bearing all round on the stonework socket should be specified and insisted upon; the tail-piece should be lined with the lead-pipe the whole length, the latter dressed over the flange all round and the joint wiped round the top edge; the whole length of the tail-piece should show above the ground level, and the joint to the drain be made with cement well flaunched and trowelled hard. A sufficient number of tacks should be put to lead soil-pipes, not less than every 5ft., in pairs on both sides. Bends should of course be avoided where possible. The soil-pipes should be carried up to a sufficient height to ensure the gases coming from them being taken away clear of windows and ventilators, but not up the side of chimneys finishing close to the chimney-pots, in which case there is a great probability that as the air from the drain comes up the ventilating-pipe it will go down the smoke-flue.

Branches into soil-pipes should he arranged so as to avoid joints being in the thickness of walls, and the connections of water-closets to the branch pieces should be carefully attended to.

Drains.

Certain points about drains should always have careful attention; for instance, where there are separate soil and rainwater drains the former should always be laid below the latter. If the rainwater be stored for use, the joints of the pipes conveying it should be most carefully made, as it is possible for water to get *into* the pipes from the surrounding earth as well as to get out, and the quality of that getting in may be very objectionable. One of the chief difficulties in laying drain-pipes is to get a true alignment at the joints. The cement exuding when the pipes are pushed up together is another difficulty, careful wiping out of the pipes at each joint being the only remedy for this most frequent defect. To obviate these difficulties some use gasket or hemp bound round the end of the spigot, to make the end of the pipe fit close and concentric; but I think the placing of a ring of composition on the spigots and sockets and a cement joint outside is the best method of avoiding difficulties of this nature and of taking a great responsibility off the man who actually lays the pipes.

The concrete on which the drains are laid is a matter on which much difference of opinion exists. I suggest that a bed 6in. or 8in. thick be laid with indentations at regular intervals for the collars of the pipes, allowing room enough to make the joint. The whole length of the pipe bearing on the concrete renders the lengths much less easily knocked out of position by accident. When each length is completed a benching at the side up to about the middle of the pipe is sufficient. Except to resist external damage, there is no object to be gained in surrounding pipes entirely with the ordinary concrete, which is of too porous a nature to keep in any sewer gas or air which may escape from defective pipes or joints. Of course if a pipe surrounded with concrete, say 18in. or 20in. square, is to be looked upon as a beam, then it is superior to a pipe with benching up to its middle only; but I think we should always try and get a sufficiently good foundation for our drains to enable us to abandon the beam theory.

Manholes.

If we turn to the construction of manholes of inspection chambers, a few remarks are necessary. If built of bricks, I do not consider footings necessary to the walls; in ordinary earth a slab of concrete extending to the external face of the wall is sufficient. I prefer rendering the interior with Portland cement to the white-glazed brick; the joints in the latter take away any benefit gained by the glazed surface of the brick. Some say that hot water damages the rendering, but as hot water does not often rise above the benching I have not found the damage to occur; the benching should be steeper than is usual, and of a convex section, so that the solids washed upon the inclined surface may slide into the central channel.

Manhole covers should always be galvanized; it is quite worth the extra cost. Turning to what is usually called the "air inlet," I think that unless it can be placed in an unfrequented position it should always carried at least 8ft. high, without any mica flap or valve of any sort—these are a delusion: they get out of order so easily, and their use as at present in towns will not continue very long.

It is an accepted fact that there is an up-current in most ventilated soil-pipes under ordinary circumstances, but where a water-closet on the soil-pipe is used it reverses the current for the time and drives the air out at the first available outlet, which is usually the so-called "inlet." For this reason, particularly in towns, the inlet should be carried up above all windows and the like, but in the country a pipe of the same diameter as the drain, taken up say 8ft., with a bend and wire-guard at the top to prevent leaves and so on getting in, is quite sufficient—perhaps more than sufficient some will say, and advocate a grating, say 18in. sq., close to the ground level.

I need hardly remind you that overflows from rainwater tanks should not, under any circumstances, be connected to soil drains, nor do I think surface-water drains should, even with traps fixed on the outlet, unless some lengths of open channel intervenes between the trap on the surface-water drain and the connection to the soil drain.

Sewage-Disposal.

In many districts the disposal of the sewage of a country house is a great difficulty where there are no sewers in the neighbourhood and the pollution of streams is very properly objected to. In such cases it is perhaps desirable to consider the advisability of having a separate system of drains to take the waste from baths, lavatories and fittings which do not take solid filth with a tank. The sewage, or excremental filth portion, can be dealt with by some of the forms of bacterial treatment known by the various names of bacterial filters, septic tanks, &c. From what I have read on the subject, it seems to me that the treatment should be a form in which the sewage is passed first through a closed tank, and then through filters exposed to the light. I would remark that I heard of the arrangement now known as the bacterial tank from a member of the Architectural Association a good many years ago, as Moura's automatic scavenger, a description of which can be seen in the Proceedings of the Institute of Civil Engineers, vol. 68, p. 350, 1881-2; vol. 72, p. 359, 1882-3; vol. 78, p. 502, 1884. From these notes I had a scavenger constructed in the latter part of 1893 at a private house I was then building, in the hope that it would render the sewage less offensive. This it has done most effectually; and although I cannot claim for it that the effluent is by any means clear, it is not offensive.

Earth-Closets.

I do not suppose any paper on the sanitation of a country house would be complete without some remarks on the dry system. A properly situated and arranged earth-closet is a most sanitary adjunct to a country house, no matter what class it may be intended for. Everything good in this world requires attention, and because the earth-closet requires perhaps a little more attention than people care to bestow upon it, it has got into bad repute. I speak now of outdoor—and shall we say isolated—earth-closets. If each country house were provided with an earth-closet constructed on the lines advocated by Dr. Poore in his books "Rural Hygiene" and "The Dwelling-House," I imagine some of the difficulties of sanitation would be got over, and some of the danger from the want of it would never arise. I refer, of course, to the "dry catch" system, the principle of which is that the floor on which the excreta falls slopes towards the outside, allowing the urine to run into a receptacle filled with mould, and so the excreta is left dry, in which state objectionable gases are not generated.

I have tried to bring before you some points which are usually admitted as essential to the sanitation of a country, or indeed, any house, but which I find require a great amount of supervision to ensure their being done properly; and as the very essence of sanitation is thoroughness in every small detail I commend the paper to your most careful consideration with the final remark that one of our objects should be to try and obtain "the most perfect action of body and mind during as long a period as is consistent with the laws of life; in other words, to render growth more perfect, decay less rapid, life more vigorous, death more remote."

The Discussion.

Mr. Thomas Blashill said he had listened to Mr. Clarke's paper with much interest. With regard to putting in drains, he thought that workmen were getting better, this being due to the fact that architects and builders knew more definitely what they wanted. As to floors, coke-breeze concrete should be put down and the boards nailed directly on to it. There would then be no risk of "dry-rot" or of ground air finding its way above; but the boards should be treated with some preservative solution, and, moreover, it should be noted that thin boards were less likely to be affected than thick ones. He had seen dry-rot in upper floors which had been pugged and the boards laid too soon. If the evil were discovered in time the fungus growth could be scraped off and the work given a good thick coat of the preservative solution mixed with whitewash. That would prove a cure. The usual defect in cast-iron closet ventilating-pipes was the formation of rust, which fell to the bottom and caused a stoppage. He expressed himself very strongly in favour of overhanging eaves, which prevented wet getting into the walls. With regard to sewage-disposal in country districts, he pointed out that the local authority would not allow it to be discharged into the ditches, while if it were put over grazing land which was not perfectly porous the result was most disastrous to cows. There was only one method of satisfactorily disposing of cottage sewage—the old-fashioned method of putting it on the garden; but he pointed out that the excreta should never be buried; it should just be covered with earth so that the bacteria could resolve it. Earth-closets were admirable, but ordinary earth – not "dry" earth or ashes – should be used.

Mr. P. Gordon Smith said he had come to the conclusion that stoneware drains were not to be relied upon because the Portland cement so often split the joints. He intended to use heavy cast-iron pipes treated with Dr. Angus Smith's solution; these he considered would be the drains of the future for all purposes. He thought a great deal more rainwater might be caught; but if this was not done properly it would be prejudicial to health. Gulleys were placed under rainwater pipes whether they were wanted or not, and were often improperly used. Copper baths were excellent in their way, but involved an enormous amount of labour in keeping them clean, so that their use was almost prohibited. Spray baths were to be recommended on account of the comparatively little water they used. With regard to cisterns, these were made more useful when in duplicate, so that if repairs were necessary the water needed to be shut off one only, thus avoiding inconvenience. Nothing had been said about cesspools. In his opinion they should never be allowed anywhere.

Mr. Edwin O. Sachs, Mr. W. E. Hewitt, Mr. Francis Hooper, Mr. E. Greenop, and the chairman also took part in the discussion. Mr. Sachs spoke of the dilatoriness of country builders, and expressed the wish that it were possible to inflict punishment for scamped work. Mr. Hooper drew attention to the necessity, in laying drains, to see that these did not fail just at the footings of the walls because the space excavated had not been concreted. Mr. Greenop referred to the fact that long lead waste-pipes on houses tended to twist under the sun's rays, and should therefore be replaced by galvanized iron pipes. He mentioned a curious instance in which £40 had been charged by the water company for extra water which they computed had been used by a consumer's flushing tank.

Mr. Max Clarke, replying to various questions, stated that it was perfectly useless to bury excreta 3ft. deep in the earth; it should be as near the surface as possible, because the bacteria required air. As to the tightness of drains, this could be done just as effectively as with hydraulic mains having a pressure of 400lbs. or 500lbs. to the sq. in.; pipes with flanged joints and asbestos packings were all that was needed. In reply to Mr. Hewitt's question as to whether he had seen tanks made by digging a hole and rendering the earth itself with concrete as described on p. 229 of last week's issue of the Builders' Journal, Mr. Clarke said this could be satisfactorily done if the gravel would stand up In conclusion, he drew attention to some New York drainage plans exhibited in the room showing every pipe and trap, as these were the kind which would be used in this country in the future.

The chairman announced that owing to ill-health Mr. Francis Bond would be unable to read his paper on "Capitals" on November 29th. Mr. Arnold Mitchell would therefore read it for him. The meeting then terminated.

ORGAN CHAMBERS AND CASES.

At a meeting of the Sheffield Society of Architects and Surveyors held on Thursday last, in the Society's new rooms in Leopold Street, Mr. Charles F. Brindley (of the firm of Brindley & Foster) gave a lecture on "Organ Chambers and Organ Cases."

He said the placing of an organ in either a concert room, place of worship, or a private house, so as to combine to the fullest possible extent musical, artistic and utilitarian principles, presents many difficulties. The organ might well be described as the most complex of complicated machines, the building of it necessitating an intimate knowledge of mechanics and science, while musical taste and culture must be present in a marked degree. He intended, however, to deal only with placing and encasing instruments, which vitally concerned the work of architects.

Dealing first with the placing of organs in concert halls, the best position for the organ was at the far end of the orchestra, and as an instance of good arrangement Mr. Brindley gave the case of the instrument built by his firm in the Town Hall at Pietermaritzburg, South Africa. Special attention should be given to allowing ample space, so that the organ may be built on one level, in order that it may not be affected by changes of temperature and so thrown out of tune by the consequent expanding of metal pipes, which occurs when instruments are constructed at different heights. In providing for machinery for blowing, care must be taken that (a) the room be dry; (b) within reasonable distance of the organ proper; (c) the temperature be the same as that of the hall.

Dealing next with the placing of organs in places of worship, the lecturer stated that lack of space allowed and disregard to all proportion were the greatest evils. Mr. Brindley then gave the opinions of experts with regard to position. The placing of the organ on a screen dividing the nave from the choir is undoubtedly the best, but is unfortunately seldom adopted and favoured by modern architects. Putting an organ in the west gallery is highly recommended by many experts. An organ chamber is not a good place for an organ. If this latter method be a necessity, the lecturer pointed out that it devolved upon the architect to design such chamber so as to mitigate the evil as much as possible by providing plenty of space, making it of sufficient height, and having ample opening into the church for the ingress of sound.

With regard to decoration, Mr. Brindley stated that the silvering adopted by his firm was well received by architects. The great thing was not to decorate pipes so as to spoil their appearance as metal pipes. The lecturer considered that inasmuch as front pipes were never made of gold, gilding might be considered somewhat out of place. Spotted metal was subject to rapid tarnishing.

A first-class built organ had pipes of full size; each pipe had ample speaking room and was of good calibre. In short, a properly-built organ may be from fifty to sixty per cent. heavier in weight than that of an organ of the cheap class. Consequently, a first-class builder required more room for a given specification than the inferior builder would know what to do with.

A Memorial Tablet at Rochester Cathedral has been unveiled to the late Mr. John Hopkins, the late organist and choir-master. It is of alabaster marble, with a centre of black marble and is the work of Mr. James E. Smith, of York Street, Westminster, carried out under the direction of Mr. S. T. Aveling, of Rochester.

Masters and Men.

The Unemployed in Berlin are now stated to number 50,000.

The Strike of Slaters at Hull and Bridlington has come to an end, in the twelfth week of the struggle. In February last the operative slaters and tilers of Yorkshire approached their employers and submitted a code of working rules for the county. Subsequently, joint conferences were held, and in July last an agreement was arrived at, and a new code of rules established and signed by the representatives of both parties. These rules came into force on August 1st, and on August 17th the Hull men took exception to them and came out on strike. The operatives' amalgamation, true to their agreement with the employers, declined to support their Hull members and refused them strike pay or travelling money. They also advertised for and drafted unionist workmen into the city to fill the places of the strikers. The Hull men failed to recognise the importance of this step or the power of their amalgamation, and they allowed themselves to be influenced into a false position by a local federation of operatives, numbering in the aggregate about 3,000 trades unionists. This federation did its utmost to support the Hull slaters and tilers both by "moral and financial aid." In consequence of a public manifesto issued by this local federation, the Yorkshire master-slaters at once entered into active co-operation with the Operative Slaters' Amalgamation, with a view to gaining the mastery of the unwarranted position taken up by the Hull men and their local federation. The Yorkshire employers drafted their senior apprentices into Hull, as also did other members of the National Association of Slate Merchants and Slaters, until a superabundance of labour obtained. At the height of the struggle four Leeds masters journeyed to Hull and slated a large building. Finding themselves beaten, the men made many overtures for a "conditional" surrender. They eventually attended before their district executive council, signed the rules, apologised for their conduct prior to and during the dispute, agreed terms for repayment of the outpocket expenses occasioned by the dispute, and gave an undertaking to abide by the ruling of the district committee in the future. Consequently the Hull employers have opened their yards and taken on such of the men as they had vacancies for.

The Birmingham Master-Builders' Association held its annual meeting last week, Councillor F. G. Whittall presiding. In the report for the year the Committee regretted that the falling off of trade, referred to twelve months ago, had become more marked, and much work that would probably not now be executed had been held back owing to the high prices of material and labour. The Committee felt strongly that the present high rate of wages was no longer justified by the state of trade, and they had received from individual members many complaints as to the great inconvenience resulting from the present arrangement of several trades commencing and leaving off work at different hours. Consequently, they had served notices on all trades for a general reduction of wages and for uniform hours of work. The Committee felt they would be voicing the opinion of every member of the Association by expressing to the Chancellor of the Birmingham University their regret that Birmingham architects had been excluded from a competition for the University buildings. The balance-sheet showed that the receipts for the year were £181, which with the balance from last year made a total of £368. The various disbursements amounted to £154, leaving a sum of £214 to the credit of the Association. Mr. Albert S. Smith was elected president for the ensuing year and Mr. John Barnsley vice-president. Mr. G. Twigg was reappointed treasurer, Mr. E. J. Bigwood secretary, and Messrs. T. Johnson and J. S. Surman auditors. The committee were also elected. In order to financially strengthen the position of the Association, it was decided that from the commencement of next year the annual subscription should be 1s. for each £100 of wages paid during the previous year. In the evening the annual dinner was held at the Grand Hotel. The Lord Mayor (Alderman J. H. Lloyd) presided, and among those present were Mr. Albert S. Smith (president of the Association), Major J. Barnsley (vice-president), Councillor F. G. Whittall, Messrs. A. Chambers (Leicester, president of the Midland Federation), W. H. Bidlake (president of the Architectural Association), A. Rowse, Ewen Harper, C. E. Bateman, Alfred Harper and Arnold Harris. Mr. C. E. Bateman, in proposing "Success to the Birmingham Master-Builders' Association," expressed the hope that some member of the Association would secure the contract for the new University buildings. The president replied, and referred to the proposal to reduce the operatives' wages. The Association, he said, was not formed for the purpose of cutting down the men's wages, and they regretted that it was necessary to interfere with them. No one grudged the operative a good wage, but what they did resent very much was that restriction of output, that constant lessening of the amount of work which the unions encouraged. Other notices had been served upon the operatives having reference to certain unreasonable restrictions in trade rules, which they were glad to have an opportunity of discussing, and they sincerely hoped all the matters would be amicably settled.

New Patents.

These patents are open to opposition until December 23rd.

1900.—**Fanlight Openers.**—19,097. E. Wait, 23, Plewlands Terrace, Morningside, Edinburgh. The fanlight is connected with a horizontal bar by knuckle-jointed arms. At one end of the bar is a pinion operated by a rack, which rack is revolved by a cord wheel fixed at the bottom of it, so that the fanlight opens or closes according to which way the cord is pulled.

Door Closers.—20,385. H. J. Huggins, 51, Coldharbour Lane, Brixton, S.W. A cylinder and spiral spring are combined with a hollow piston-rod provided at its outer end with a controlled air-exhaust. The closing action can thus be regulated to a nicety—so preventing slamming.

Jointing Lead Pipes.—21,139. R. A. Lowe, Lower Camden, and H. Line, both of Chislehurst, Kent. The end of each pipe is passed through a ferrule and bent over so as to form a flange. The pipes are then drawn together by a screw-nut, with or without packing. The object is to avoid soldering.

T-Squares.—23,179. A. Pattison, Friars Wood, Newcastle-under-Lyme, Staffs. Small milled rollers are mounted in or on the head of the T-square, to facilitate its use on the board.

The following specifications were published on Saturday last, and are open to opposition until December 30th. The name in italics is that of the communicator of the invention. A summary of the more important of them will be given next week.

1900.—19,280, Jandus Arc Lamp & Electric Co., Ltd., Gorham & Jones, electric arc lamps. 19,318, Godfray, distributing steam and water for heating and other purposes. 19,575, Childs, cradles and platforms of endless chain or rope hoists. 20,323, Nuttall & Wilson, baths. 20,459, Howson, waste-valves. 20,588, Coe, incandescent gas lighting. 21,219, Stevens, vices. 21,226, Brown, drying bricks, tiles, &c. 21,879, Digby, lamps for theatre stages. 22,067, Willshear, refuse-destroyers. 22,579, Schroeter, high-pressure steam-heating pipes. 22,891, Buchberger, apparatus for drawing in perspective from geometrical and other sketches. 22,921, Illidge, casement stays. 23,004, Smith & Walker, rainwater pipe wall-socket. 23,305, Keddell, domestic firegrates. 23,605, Portable Gas Fountain Syndicate, Ltd. (*Thorert*), incandescent gas burners. 23,701, Rosenberg, self-igniting incandescent gas-lights.

1901.—12,069, Lassam, glazing bar for skylights. 13,373, Murray, float valves. 16,588, Herdman, non-conducting coverings for steam pipes and other surfaces, packings for walls, &c. 16,695, Holmes, chains. 17,479, Vollert, detachable ornamental head for nails and screws. 17,995, Hunt, conveyors. 18,809, Mitchell, appliance for illustrating by sectional views the construction of pieces of mechanism.

BUILDING CONSTRUCTION.

(*Continued from p. 237, No. 353.*)

Beams (*continued*).

37. I HAVE assumed that there is a neutral line, and that it bisects the cross-section horizontally. The material being assumed to be homogeneous and the loading and reactions of supports being taken to be forces at right angles to the centre line of the beam symmetrically applied (so that they do not produce any torque or twist to the beam), there is no difficulty in agreeing to this assumption. Where the cross-section is not a rectangle placed with two sides horizontal, the position of the neutral line is not so obvious. The neutral line, in all cases where the forces applied to a horizontal beam are vertical, passes through the centre of gravity of a cross-section. The condition that a line passes through the centre of gravity of a plane figure is that a thin stiff plate cut to the figure, when placed so that this line lies along a fine knife-edge, will balance. This means that if the area on each side of the line is divided into very small equal parts, and if each small part is considered as a weight or force, and its amount is multiplied by its distance from the line, the sum of the products on one side of the line shall be equal to the sum of the products on the other side of the line. (The student should remember that a line through the centre of gravity of a plane figure does not necessarily divide it into two equal areas. For example, take an isosceles triangle having its base 3in. and its height 3in. Its centre of gravity is at O (Fig. 43), 1in. from the base, and a horizontal line through O divides the figure so that there is a triangle above and a trapezium below. The area of the triangle is $\frac{2 \times 2}{2} = 2$; the area of the trapezium is $\frac{2+3}{2} = \frac{5}{2}$.)

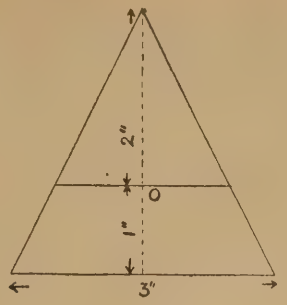

FIG. 43

The centre of gravity of a plane figure may be found experimentally by cutting the shape in zinc, making this fairly flat and then balancing it on a knife-edge: the line along which it balances passes through the centre of gravity; find a second line in the same way; the intersection of these lines is the centre of gravity of the figure. It follows from Hooke's law that the force of the stress per unit of area is proportional to the distance of the element from the neutral line. Suppose the stress per unit of area at unit distance is k, then at any distance y the stress per unit area is ky; if Δ be the area of each element, the stress on each element is $k\Delta y$, where $k\Delta$ is a constant. If the quantities $k\Delta y$ are positive in sign above the neutral line, they are negative below the neutral line; the condition that the neutral line passes through the centre of gravity is that $\Sigma\Delta y = 0$; but the pulling stresses are on one side of the line and the pushing stresses on the other side, and these two sets of stresses are equal. $\therefore \Sigma . k\Delta y = 0$, and this condition is fulfilled if $\Sigma . \Delta y = 0$. (Σ is the symbol for the "sum of"; and $\Sigma\Delta y$ means the sum of all the quantities found by multiplying each little area Δ by y, its distance from the neutral line or axis.) The forces applied to the beam have no resolved part at right angles to their line of action.

38. It is otherwise, however, if the external applied forces are not at right angles to the centre line of the beam; such forces give a pull or thrust endwise to the beam. If p is the stress per unit of area at the outside fibres at the top of the beam shown at Fig. 44, a direct end thrust of Ap, where A is the area of the cross-section, will bring the neutral line down to D, as shown, and there is now no stress in the bottom fibres. On the other hand, a pull of Ap would double the stress on the bottom fibres, and relieve the top fibres from all stress. Greater and less thrusts and pulls will move the neutral axis outside the limits of the cross-section on to some intermediate positions which are not central.

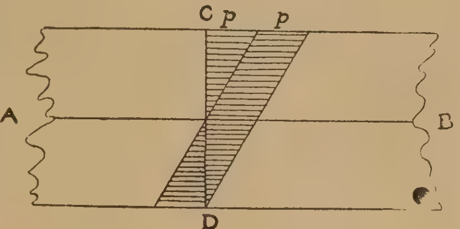

FIG. 44

If p is the stress per unit of area at which the material will yield, the beam will break, because, though only the outer fibres are stressed to this amount if they yield a greater stress comes upon the next layer, and so on in succession: the beam breaks down instantaneously.

39. With most materials their power to resist crushing is not the same as their power to resist tearing. We have seen above that the neutral axis of a cross-section in a horizontal beam subjected to vertical forces passes through the *centre of gravity* of the cross section. These conditions were taken account of in designing cast-iron beams forty to fifty years ago, and they are still of importance in construction. Fig. 45 represents a cross-section of a cast-iron beam: the area above A B, being in compression, is smaller than the area below A B, because the material will bear a much greater stress per sq. in. in compression than in tension. If p is the stress per sq. in. at which the material will crush, and p' that at which it will tear, it may be decided that the design will not allow greater stresses than $\frac{p}{5}$ and $\frac{p'}{5}$; then $\frac{a}{5} p' = \frac{b}{5} p$. The *factor of safety* is said to be 5, because the beam might carry five times the working load and just be on the point of breaking.

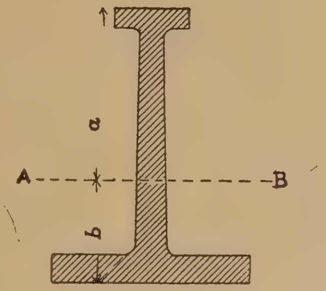

FIG 45

40. Take a light piece of wood of uniform rectangular cross-section, and make one end fast at A E (Fig. 46); have a spring balance with adjusting screw S and stirrup D B. Hang a weight at W, and adjust the balance to show a reading which will equal W + w $(l - x)$, where w is the weight of the piece of wood per unit of length. The piece to the right of the stirrup is in equilibrium under two couples, namely, that of which one force is the weight shown by the spring balance, and the effective couple resulting from the pulls and thrusts of the cross-section at D B: these two couples are each equal to the bending moment at D B. The bending moment is the same at every part of the length x, and consequently the curve in x is circular. By moving the stirrup and balance to various positions, we find that as the bending moment is varied the curve alters. If we can measure the curvature in x, it is that due to the bending moment at the point B, when the piece is allowed to bend freely without the stirrup. Let B be the bending moment at D B, then $B = \frac{2p}{a} I$ (1), where p is the stress per unit of area in the outer fibres E D and a the depth of the piece. Let k be elongation of top fibres, $k = \frac{px}{E}$ (2). Now E D has become $x + k$, and the neutral line has remained x. Radii of circles are as their circumferences $\therefore \frac{x+k}{x} = \frac{r + \frac{a}{2}}{r}$, from which $r = \frac{ax}{2k}$ (3). From (2) and (3) we have $r = \frac{aE}{2p}$ (4); and from (4) and (1) we have $r = \frac{EI}{B}$. We may now substitute for B, $\left(W + w\left(\frac{l-x}{2}\right)\right)(l - x)$, in which w is the weight of a unit length of the piece.

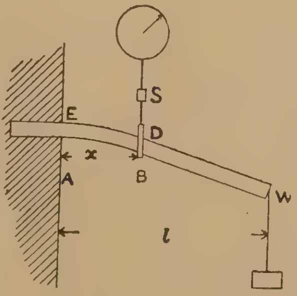

FIG. 46

It is easy to see that the deflection—that is, the fall of W—is great when r is short; that is: deflection $D \propto \frac{B}{IE}$, say $D = c \frac{B}{ba^3E}$ for beams of rectangular cross-section. From this equation it is seen that D varies inversely with the breadth of the beam (b), and inversely as the cube of the depth (a^3).

This is a most important practical result, and the student has not been asked to follow any but the most elementary algebra. Knowing that the deflection of a beam of uniform cross-section is inversely proportional to the moment of inertia (I) of the beam, a practical man could easily, after experimenting with a model, design a beam to carry a given load with a specified deflection.

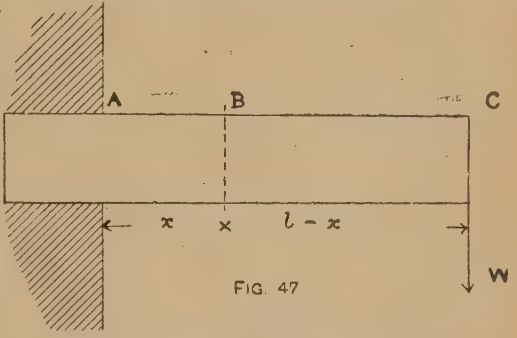

FIG. 47

Curvature is inversely as the radius of curvature; that is, if r is the *radius* of curvature, $\frac{1}{r}$ is the *curvature*.

41. From the equation $r = \frac{EI}{B}$ the formulæ for deflection of beams are easily deduced, but the operation involves higher mathematics. I take the following from Prof. Perry's "Applied Mechanics," pp. 405 409. For very flat curves curvature $\left(\frac{1}{r}\right) = \frac{d^2y}{dx^2}$. Strictly: $r = \frac{\left(1 + \left(\frac{dy}{dx}\right)^2\right)^{\frac{3}{2}}}{\frac{d^2y}{dx^2}}$.

Expand the numerator by the Binomial Theorem $\left(1 + \left(\frac{dy}{dx}\right)^2\right)^{\frac{3}{2}} = 1 + \frac{3}{2}\left(\frac{dy}{dx}\right)^2 + \frac{\frac{3}{2}\cdot\frac{1}{2}}{1\cdot 2}\left(\frac{dy}{dx}\right)^4 +$ &c. $\frac{dy}{dx}$ is the tangent of the angle which the tangent at any point on the curve makes with a horizontal line. The deflection in practical beams is so small that this angle is at any point very small, so small that $\left(\frac{dy}{dx}\right)^2 \left(\frac{dy}{dx}\right)^4$, and all higher powers may be neglected.

$$\frac{d^2y}{dx^2} = \frac{W}{EI}(l - x).$$

$$\frac{EI}{W}\frac{d^2y}{dx^2} = l - x. \text{ Integrate.}$$

$$\frac{EI}{W}\frac{dy}{dx} = lx - \tfrac{1}{2}x^2 + c, \text{ c but } c = 0.$$

Integrate again.

$$\frac{EI}{W}y = \tfrac{1}{2}lx^2 - \tfrac{1}{6}x^3 + c.$$

When $y = 0$, $x = 0$, and consequently $c = 0$,

$$y = \frac{W}{6EI}(3lx^2 - x^3).$$

This is the equation to the curve, A being the origin, A C the axis of x, x measured positive to the right, and y positive downwards.

To find the *Deflection* D or the drop of C, make $l = x$

$$D = y = \frac{Wl^3}{3EI}. \quad . \quad . \quad (1.)$$

When a beam is supported at both ends and loaded in the middle, imagine it turned upside-down to balance on the point C, the deflection at each end will be

$$D = \frac{\frac{W}{2} \cdot \frac{l^3}{8}}{3EI} = \frac{Wl^3}{48\,EI}. \quad . \quad . \quad (2.)$$

Beam fixed at one end and loaded uniformly.

$$B = \tfrac{1}{2}w(l^2 - 2lx + x^2)$$

$$\therefore \frac{2EI}{w}\frac{d^2y}{dx^2} = l^2 - 2lx + x^2.$$

$$\frac{2EI}{w}\frac{dy}{dx} = l^2x - lx^2 + \tfrac{1}{3}x^3 + c_1, c_1 = 0.$$

$$\frac{2EI}{w}y = \tfrac{1}{2}l^2x^2 - \tfrac{1}{3}lx^3 + \tfrac{1}{12}x^4 + c_2, c_2 = 0.$$

$$y = \frac{w}{24EI}(6l^2x^2 - 4lx^3 + x^4).$$

When $x = l$,

$$y = D = \frac{w}{24EI}(6 - 4 + 1)l^4 = \frac{w}{8EI}l^4;$$

r if we take $W = lw$,

$$D = \tfrac{1}{8}\frac{Wl^3}{EI}. \quad . \quad . \quad (3.)$$

Beam supported at both ends and loaded uniformly. Moment at C $= \frac{w}{2}\left(\frac{l^2}{4} - x^2\right)$.

$$\frac{2EI}{w}\frac{d^2y}{dx^2} = \frac{l^2}{4} - x^2,$$

$$\frac{2EI}{w}\frac{dy}{dx} = \frac{l^2}{4}x - \tfrac{1}{3}x^3,$$

$$\frac{2EI}{w}y = \frac{l^2}{8}x^2 - \tfrac{1}{12}x^4.$$

Let $x = \frac{l}{2}$, then $\frac{2EI}{w} = \frac{5l^4}{192}$,

$$D = \frac{5Wl^3}{384EI}. \quad . \quad . \quad (4.)$$

The above applies to beams of uniform cross-section. We see from the equation $\frac{1}{r} = \frac{B}{EI}$ that in beams in which $\frac{B}{I}$ is a constant quantity the curve of the beam is a circular arc.

The number E for any material may be found experimentally; referring the deflection observed to any of these values, perhaps the best to use is (2).

42. I have shown, section 36, how to calculate the *moment of inertia* of a *rectangle* about an axis through its centre and parallel to a pair of sides.

The moment of inertia of a thin plate about an axis at right angles to it is equal to the sum of the moments of inertia about two axes on the plate at right angles to one another and intersecting at the point where the first axis meets the plate (Fig. 51).

Take a small element p. Its moment of inertia about O X is py^2, and about O Y px^2, but $x^2 + y^2 = r^2$, and pr^2 is its moment of inertia about an axis through O at right angles to the plane of Y O X. The circle, Fig. 52, is divided into concentric rings, each of the very small breadth δ. Suppose a ring to have its mean circumference at the distance δ from O, the centre of the circle, its area is $2\pi\delta^2$, its moment of inertia about O is $2\pi\delta^4$. The next ring has for area $4\pi\delta^2$, and its moment $4 \cdot 2^2\pi\delta^4$. The area of the next ring is $6\pi\delta^2$, and its moment is $6 \cdot 3^2\pi\delta^4$. The sum of these moments

$$\Sigma = 2\pi\delta^4(1 + 2^3 + 3^3 + 4^3 + \&c. + n^3)$$

$$= 2\pi\delta^4\left(\frac{n(n+1)}{2}\right)^2.$$

Now, by taking n large enough, δ may be made smaller than any assigned quantity, however small, and the above sum becomes $\frac{1}{2}\pi R^4$. Since in this case the moments of inertia about two diameters at right angles are equal, I about one diameter $= \frac{1}{4}\pi R^4$.

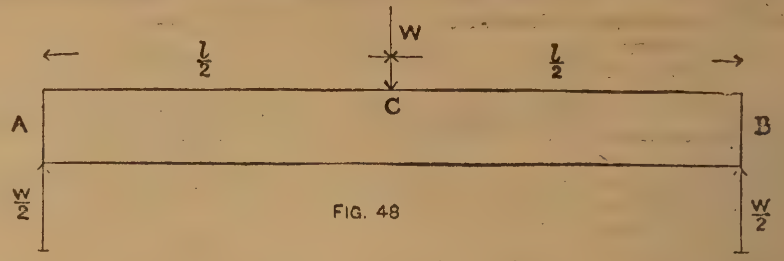

FIG. 48

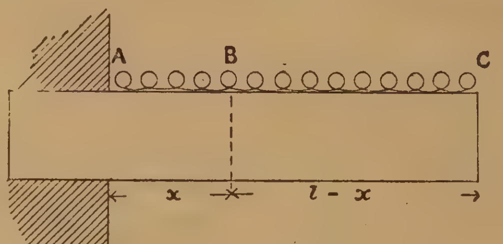

FIG. 49

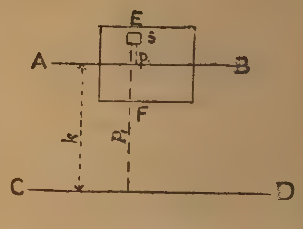

FIG. 53

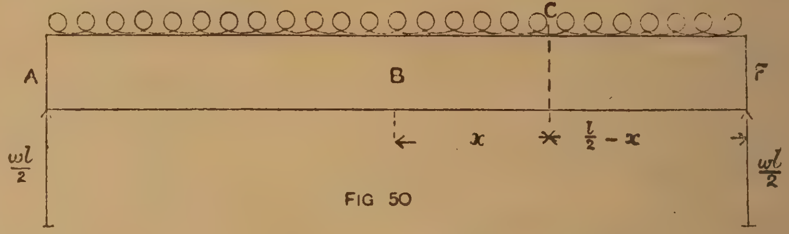

FIG 50

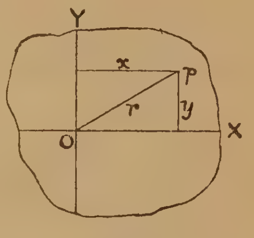

FIG. 51

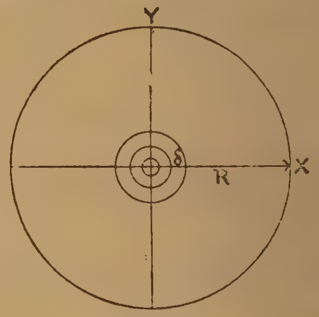

FIG. 52

The moment of inertia (J_2) of an area about any axis parallel to an axis through its centre of gravity is equal to the moment of inertia about the axis through the centre of gravity (J_1), together with the product of the area and the square of the distance between the two axes $J_2 = J_1 + \Delta k^2$.

Referring to Fig. 53, consider the element of area s in E F. Its moment of inertia about A B is sp^2, its moment about C D is sr_1^2,

$$\text{now } r_1^2 = k^2 + p^2 + 2pk.$$

$$\therefore sr_1^2 = sk^2 + sp^2 + 2spk,$$

$$\text{and } \Sigma sp_1^2 = \Sigma.sk^2 + \Sigma sp^2 + \Sigma.2spk,$$

$$\text{but} = sp = 0 \therefore \Sigma 2spk = 0;$$

$$\text{and } J_2 = K^2 \text{ area EF} + J_1.$$

43. Compare the rough practical calculation of the strength of a rolled joist with the more careful exact calculation (Fig. 54). At 4 tons per sq. in. area of flange 3 sq. in. × 4 tons × 1 ft. B M = 12: the joist will bear a maximum bending moment of 12ft. tons.

By the more exact method B M $= \frac{2p}{d}$I, B M $= \frac{2p}{d}\,\frac{bd^3 - b_1d_1^3}{12}$. Take these dimensions in feet:

$$BM = 2 \times 4 \times 144 \times \left[\frac{\frac{1}{2} - \frac{11}{24} \times \left(\frac{11}{12}\right)^3}{12}\right]$$

$$= 4 \times 12 \times \left[1 - \left(\frac{11}{12}\right)^4\right]$$

$$= 4 \times 12 \times \frac{6095}{20736} = \frac{6095}{432} = 14\text{ft. tons.}$$

Where the web is deep and thick compared to the breadth and thickness of the flanges, it is advisable to calculate exactly.

The moment of inertia for a rectangle about a line through its centre parallel to its breadth we found to be $I = \frac{bd}{12}$, where b = breadth and d = depth of the rectangle. The moment of inertia of a cross-section (Fig. 55) is the difference of the moments of the outer and inner rectangles. If this figure is cut vertically, and the two parts placed as in Fig. 54, it will form a cross-section of a I rolled joist $I = \frac{bd^3 - b_1d_1^3}{12}$.

I use this value above.

(*To be continued.*)

Correspondence.

The Trend of Modern Architecture.

To the Editor of The Builders' Journal.

Sir,—Though somewhat late in the discussion, I should like to make a few remarks relative to the proposed cathedral for Liverpool, more especially in regard to the paper by Professor Simpson published in your issue for October 16th.

Do we really admit that no Gothic architect ever equalled Brunelleschi? Do we adopt Michael Angelo's view of the master's work at Florence and reject altogether the late Mr. Ferguson's? Surely Giotto, Tenanti, De Montereau, and others named by the Professor, had as much ability, and their work was of equal beauty and originality. Passing in mental review the most important Renaissance cathedrals, is there one that surpasses in beauty those of the Middle Ages, whether in French or English Gothic—or say "Pointed" if we have none such, properly so-called?

We may admit the originality of St. Peter's at Rome—*i.e.*, its gigantic scale—while we recognise that it imparts *per se* no beauty, and is altogether a mistake, inasmuch as all proportion is lost. Quite apart from its being exotic, we had undoubtedly grown to admire St. Paul's; but I scarcely think there is any intense desire to repeat its cheerless gloomy solidity. The egotistical school of designers has lately worked its will, but we bow not down to them yet, over the mosaics or the glass. Though we may picture in fancy the splendour of Mr. Bentley's fine exotic in Tothill Fields, with all its novelty on English soil, we would surely not desire a repetition of it at Liverpool.

In civil and domestic work there is a spirit of restlessness abroad which may indicate a real desire for progress; but, on the other hand, may breathe the spirit of the ancient Athenians which evoked the Pauline rebuke. Restless and bizarre phases have come and gone, *e.g.*, the chamfered style of the old Strand Music Hall, and a queer front in Oxford Street, both of which will soon be a mere memory. It was simplicity *in excelsis* compared with some recent work in restaurants and public-houses, in which there is hardly a quiet point of surface whereon the eye can rest. In the chaster designs of some of our leading men a late Perpendicular type is adopted which to the most enthusiastic Goth is comparatively unsatisfying and poor; and where a flowing line for tracery is adopted it is worse, for it is after such a decadent type as Saint-Eustache, Paris, rather than the strong geometrical lines of Exeter or Wells Cathedrals.

Then the present trick adopted for gaining pseudo-picturesqueness by tacking a Renaissance morning-chapel on to a Perpendicular chancel is to be deprecated, though some of the younger men seem to think it shows individuality. Originality may surely become a fetish if pushed to extremes. Roslin chapel is original, but, compared with Merton College or even Henry VII.'s Chapel, is scarcely a type to be repeated in the present age.

One is obliged to go outside of England to find an example of very bizarre work, so chaste is our National Gothic, even its latest phase of redundant panelling. Originality is evidenced in French design such as the Petit Palais and Grand Palais of the Paris Exhibition of 1900, but is it possible that an English architect would long ponder these buildings? As further evidence of the search for novelty, is it not the case that to Spain the architect looked for inspiration for the most important buildings of the Glasgow Exhibition this year? *

Without being so blunt as to speak of "dying nations" we may fairly consider whether their architecture is not moribund, when some of us are found speaking of our noble national style as being dead.

Our lovely city of Oxford and other towns are being defaced by poor heavy examples of Queen Anne and Georgian work, by no means original and entirely out of harmony with the old buildings, while it is far from indicating the spirit or aim of the present age, if it be individuality.

In rural architecture the low Dutch type of house, covered with rough-cast, heavily buttressed at the angles, long low draughty windows, squat doors and a green water-butt guarding the side entrance, is too much the vogue; and if you can only get a yew-hedge to cut into a large egg with a small fowl on the top of it, you have the *ne plus ultra* of a book of bungalows designs so much in demand by students.

Why it should be dubbed "clever forgery" to take inspiration for a cathedral from the Angel Choir at Lincoln, and "clever originality" to take Staples Inn or the stables at Hampton Court for a gentleman's country-house, I have never been able to see. Amateurs are showing the same tendency, as witness an extraordinary *olla podrida* in Oakley Street, Chelsea, where a house front has been some years under process of applied features whose effect is a terrible shock to the beholder.

When the original genius appears who is to transfigure "dead" architecture—for if Gothic be dead, Classic is not less so—we will welcome him with open arms.—Yours truly,

E. W. HUDSON, A.R.I.B.A.

Building Construction.

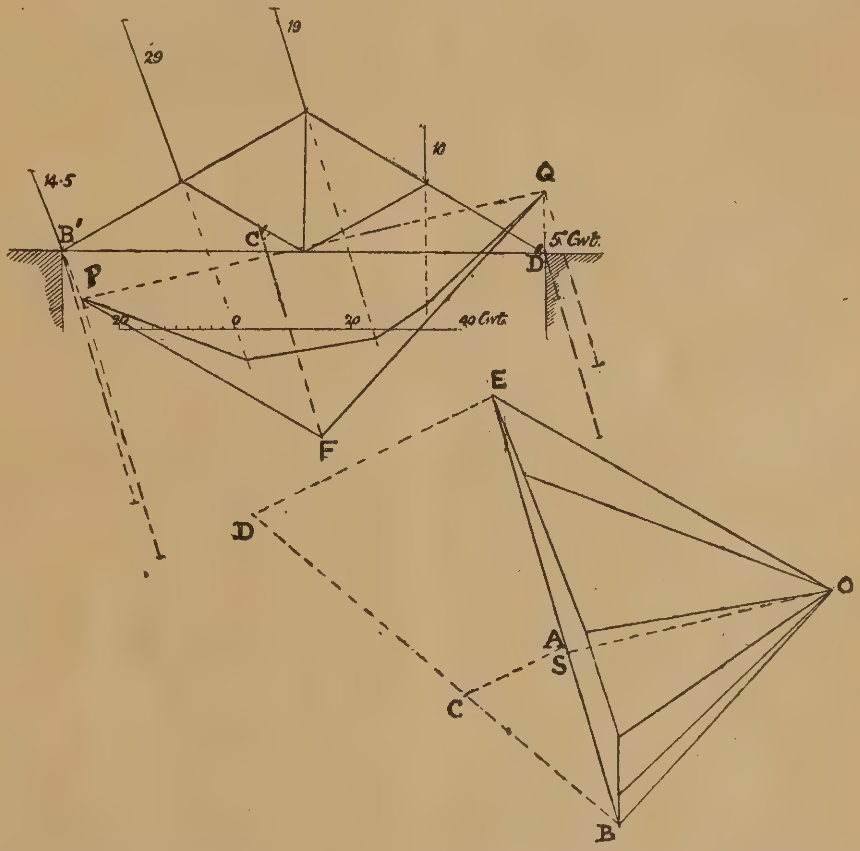
To the Editor of The Builders' Journal.

Sir,—In the article on "Building Construction" in your issue for October 30th the author says on p. 203, column 2, five lines from the bottom: "The point O has been chosen . . . . to show in a marked manner that the point A cannot be found by drawing a line through O parallel to the line joining P and Q . . . . In the case where the loads are *all* vertical the point is found by drawing a line from O parallel to P Q."

Now, in the example he refers to earlier in the chapter (namely, question 45, South Kensington, subject III.), which is shown worked out on p. 405 of your issue of June 26th last, in which the loads are *not* all vertical, the apices of the funicular polygon *are* shown joined by a dotted line; and the point A (dividing point between the reactions) has apparently been found by the method he states in the above-mentioned article to be wrong—otherwise why was a dotted line shown in that position at all? It seems that one or other must be wrong.

Also, are these examples intended to have a possible practical application, or are they merely theoretical exercises? If they are intended to be practical, why are some of the loads on a roof truss assumed to act at an inclination other than 90 degs. to the roof-surface or vertical loads? It seems that a roof can only be exposed to two forces, namely, a dead load (such as framing, roof-covering and snow) and wind-pressure, the dead load acting vertically and the wind-pressure usually horizontally, though generally resolved normal to the roof-surface (by multiplying by the cosine of the angle of inclination). Thus the forces acting on a roof must be either vertical or normal to the roof-surface, and in practice no other conditions can arise. I should therefore be glad to know why in this article are loads assumed which act at various angles, such being an impossibility in practice, as the wind never blows at an angle but a few degrees removed from the vertical, and yet some of these examples assume a similar angle.—Yours truly,

PERPLEXED.



In reply to the queries of "Perplexed":—

(1) When the loads are transferred to the string, the string may be supposed to be attached at P and Q to the ends of a strut P Q. The dotted line O S represents the stress in this strut, and the lines B S, S E, represent parallel reactions at Q and P respectively, which would support the strut and string with their applied loads. Now, suppose P and Q to be rigidly fixed to the truss. We have to apply at B' and D' parallel forces which will do the same duty as the forces at P and Q. The line C' F is the resultant (not in magnitude in the figure) in position of the forces at P and Q; it is also that of the forces to replace these, to be applied at B' and D', and the point C' is where it intersects the line B' D'.

$\therefore \frac{\text{Force at } B'}{\text{Force at } D'} = \frac{D'\,C'}{C'\,B'}$; the line B E is cut at A in this proportion: $B\,C = B'\,C'$, $B\,C = B'\,C'$, and C A is drawn parallel to D E. If the point O is chosen so that S O will be nearly parallel to B' D' the point S will very nearly coincide with the point A. The point A is not *found by the dotted line*. The difficulty of "Perplexed" shows that it was necessary to give the warning to which he refers.

(2) These examples are intended to be fairly practical. The loads about which "Perplexed" asks are the resultants obtained by compounding the vertical loads with the wind loads at the several points. They are, consequently, neither vertical nor at right angles to the line of rafter.

---

* In our own Exhibition buildings nothing has ever come up to that of 1851 in expressing its purpose and providing for requirements. The very features in Captain Foukes' subsequent building that met with the objections of architects of that day are now adopted. It is this uncertainty of estimate of what is true architecture that causes our criticisms to be unheeded and makes the public indifferent.

Keystones.

The Nave of St. John's Church, Gainsborough, Lincolnshire, is to be lengthened by three bays, at an estimated cost of over £2,000.

A New Village Institute at Frensham has been opened. It is built of red bricks with a tiled roof. Mr. G. B. Carter, of London, is the architect, and Mr. Andrew Chuter, of Frensham, the builder.

A Bronze Mural Tablet has been placed in the hall of the Bridgend Institute to the memory of the late Mr. Andrew Coates, of Pitcullen. It has a green marble framing. It was carried out under the direction of Mr. David Smart, architect.

Llanrothal Church has been restored under the direction of Mr. Clark, of Hereford. Part at least of the existing building is Norman, the very small window in the north wall deeply splayed inside being obviously in that style. The windows in the south wall of the nave, the east window and the chancel arch are Early English in character, and the small high west window may probably belong to the Decorated period. A large four-light late fourteenth-century window has been inserted in the south wall of the chancel.

Wolverhampton Art Gallery and the Exhibition.—The tender of Messrs. George Cave & Son, builders, Wolverhampton, amounting to £320, for the execution of work in the shape of repairs to the roof of the Art Gallery, has been accepted by the Town Council. The International Exhibition Committee having found it impossible to erect a satisfactory building in which to house the art collection, the present scheme has originated. The Art Gallery is to be decorated, towards the cost of which the Exhibition Committee has granted £1,500, in addition to £500 for the roof repairs. Thus money will not have to be spent on a temporary building, but on a permanent object for the benefit of the town.

The Parish Church of Kidderminster is being restored, and the oak roofs which have been erected in the north and south aisles were dedicated recently. Since the year 1847 it is estimated that over £30,000 has been expended in the work of restoration. The oldest part of the present church is the chancel; but that cannot be ascribed to any period earlier than the reign of Edward I. (1272); while the beautiful tower, which originally stood by itself, is not earlier than the time of Edward III. (1327). The nave, connecting the two, was built later still. The work which has now been carried out will cost over £800. The ceilings are constructed of solid oak, moulded and panelled. The whole of the work has been carried out by Messrs. Collins & Godfrey, of Tewkesbury, from drawings and specifications and under the superintendence of Messrs. J. A. Chatwin & Son, of Birmingham.

An Architect's Exciting Experience.—At Bow Street Police Court last week a man named William Edge, aged twenty-five, and described as a student, was charged with threatening Mr. James Neale, architect, of Bloomsbury Square, with a revolver. It appeared that Edge visited Mr. Neale's office last Thursday, and when informed that a certain flat which he desired was not to let, said: "You are now in my power. We are alone. There is no one else in the other offices." He then produced a revolver and pointed it at Mr. Neale's head, saying, "If you move one step towards the door I'll fire and kill you." Mr. Neale, taking a seat, said: "Don't be a fool, man." Edge then produced and made Mr. Neale sign a certain letter of apology for an alleged insult. Having placed the letter in an envelope and addressed it, Mr. Neale handed it to Edge, and in doing so touched the button of a private telephone at his side. Edge noticed the action, and exclaimed: "Ah! you rang that bell. I now fire." He did not do so, however, but continued: "You needn't ring. We are all alone." At that moment a clerk named Henderson came in, and Edge then put the revolver in his pocket. Mr. Neale immediately got hold of him by the throat, and after a struggle Henderson got the revolver from him and threw it away. Edge was perfectly sober. No bail was allowed.

New Institute at Chopwell has been erected by the Consett Iron Co., Ltd., for their workmen.

St James's School, Lower Darwen, is being extended from plans by Mr. Fred J. Parkinson, architect and surveyor, of Blackburn. Messrs. Lloyd & Sons, of Darwen, are the contractors.

Mr. A. J. B. Ward, of Messrs. B. Ward & Co., Ltd., of 38 and 39, Parliament Street, Westminster, S.W., the well-known makers of various pavings, fireproof floors, staircases, &c, died on November 7th and was buried at Newcastle on November 12th.

Partnership Dissolved.—The partnership lately existing between Messrs. Robert Clamp and J. B. Drower, architects, of Woking, Surrey, and Fleet, Hants, has been dissolved. The practice at Woking will in future be continued by Mr. I. B. Drower, and that at Fleet by Mr. R. Clamp, separately.

Liverpool Cathedral.—In reply to Mr. T. Myddelton Shallcross, Sir William B. Forwood says that "the site has been definitely fixed at St. James's Mount, and no alteration will be made. The foundations have been proved, the levels are now being taken, and in due course a plan will be at the disposal of architects."

A New Chancel Screen at St. Nicholas Church, Bristol, has been erected. The screen has a base of Bath stone, ornamented with six panels, each of which has a shield. Immediately opposite the centre aisle of the nave there are double gates of wrought-iron. The top part of the screen is composed of wrought-iron, worked with arcading, capped by a figured border. The decoration is being carried out by Messrs. Joseph Bell & Son, of 12, College Green, under the direction of the architect, Mr. W. V. Gough, Bridge Street, Bristol.

The Birmingham Homœopathic Hospital is being extended. Messrs. Crouch & Butler, of Newhall Street, Birmingham, have made designs in keeping with the existing premises. Addition will be made to the ward accommodation, and the hospital, when the new wing is completed, will be able to provide beds for forty-two patients. But the extension applies principally to what is technically termed the "administrative block," and here better provision is being made for the staff. The extensions will cost about £5,000.

A War Memorial at Bristol is to be erected in College Green. Mr. Fred W. Marks, architect, of London, has prepared the design, which is an obelisk consisting of a bold shaft of Swedish red polished granite, with finely axed decorative fluting and ornamental design on the lower part of its sides. The base on which the shaft will rest is to be of polished green granite, and this in turn will stand on grey granite steps, finely axed. Its site is to be surrounded by twelve grey granite posts, connected by heavy bronze chains. The obelisk will be 41ft. in height from ground level to the top, and will occupy an area of 13ft. sq. It will cost £4,000.

Architecture at the Yorkshire College, Leeds.—When the Council of the Yorkshire College have inaugurated two or three important schemes which they have in hand, they will probably turn their attention to the subject of architecture. The college curriculum at present includes a course for architectural students, but what Principal Bodington has in view are full courses dealing with architecture in its historical, artistic and utilitarian aspects. It is suggested that the architects of Yorkshire, following the example of the lawyers, should start a movement to raise the funds necessary for giving their profession a recognized status at the college.

The New Offices for the Guardians of the Hartlepools, erected at the cost of £6,972, including site and furnishings, were formally opened last week. The building is plain, occupying a site 60ft. wide and 130ft. long, situated in Hart Road and Tees Street, West Hartlepool. It is faced with red Accrington pressed bricks with stone dressings. On the ground floor is a committee-room with suite of clerks' offices and strong room adjoining, two offices for relieving officers, waiting-room, vaccination officer's room, sample room, &c. Upstairs is the board-room, cloak-rooms, surveyor's office, caretaker's apartments, &c. The building is lighted throughout by electricity. Mr. J. J. Wilson, of West Hartlepool, is the architect, and Messrs. Gradon & Son, of Durham, are the builders.

The Temple Church.—The stonework of the Temple Church, both on the exterior and in the porch, has been found to be in a serious state of decay lately, and it is understood that steps will shortly be taken to repair it. The stonework of this church, which is over 700 years old, was last restored in 1842.

Mr. Joseph Grimshire, who a month ago was exploring Sicily with characteristic energy, was buried in Abney Park Cemetery on Saturday last. Although a successful manufacturer in London for half a century, he studied and travelled amidst the ancient cities of Western and Central Europe, formed a large collection of books, pictures, photographs and prints dealing with old buildings, and gave many illustrated lectures to antiquarian and ecclesiological societies. He rarely met an architectural student without offering him encouragement in some practical form.

The Song of the Carvers in the Exeter studios of Messrs. Harry Hems & Sons so impressed the Rev. Robert S. Routh, the Hampshire poet, whilst recently visiting them, that he could find no rest till he has set in verse his "Thoughts on the Woodcarver's Song." Writing to the local newspaper he says: "The poet you keep on the premises would no doubt have done it much better, but it is a relief to me to pour out my soul." And so we are told that the carver's song is "as the sea-beat on the strand . . . . rising like the billow's roar." We are wondering what the carvers think!

The British Fire-Prevention Committee.—Mr. Edwin O. Sachs, chairman of this Committee, will read a paper on "Fireproof Construction" before the Royal School of Military Engineering at Chatham to-morrow, the date being selected as near as possible to the anniversary of the great Cripplegate Fire of 1897, which, it will be remembered, took place on the afternoon of November 19th. Mr. Ellis Marsland will read a paper on the Committee's work before the Insurance and Actuarial Society of Glasgow on December 9th. Mr. Marsland is the master of the Tylers' and Bricklayers' Company for the current year.

The Executive Committee of the National Trust protests against the erection of a barbed wire fence in proximity to Stonehenge. It has also resolved to make a public appeal for £150 in order to complete the purchase of the picturesque fourteenth-century cottage at Tintagel, known as the "Old Post-Office." The structure has been offered to the Trust for £200, of which sum £50 has already been subscribed. It is reported that the Old Jacobean Cloth Hall at Newbury is to be preserved, and that a local committee has been formed for the purpose of purchasing and repairing the building and converting it into a museum and art gallery.

Overhanging Lamps and Signs.—Certain by-laws are proposed to be made by the London County Council for "the regulation of lamps, signs or other structures overhanging the public way, not being within the City." They will be administered by the borough councils, to whom they have meanwhile been submitted for consideration. A special committee of manufacturers and traders in the principal businesses in London was formed under the auspices of the Chamber of Commerce to examine the proposed by-laws, and they report that they object to the provisions involving the special "sanction" of the local authority in matters of everyday necessity and established custom, except so far as may be necessary for the public safety.

The T-Square Club opened its second season on Wednesday last with a smoking concert in the Crown Room at the Holborn Restaurant. Mr. E. W. Mountford presided. The programme was an excellent one, the feature of the evening being Mr. W. H. Squire's 'cello solos. The vocalists Mr. Bantock Pierpoint and Mr. Whitworth Mitton were well received, and clever musical sketches were given by Mr. Charles Frood. Mr. Wilson James and Mr. Edward Barwick furnished humorous items, and sleight-of-hand tricks and ventriloquism by Mr. John Warren caused much amusement. Mr. Alfred Smythson was the pianist. The address of the secretary of the club, Mr. T. Wilson Aldwinckle, is now St. Andrew's, Mitcham Park, Mitcham Surrey.

An Exhibition of Pictures at the Doulton Institute is on view during this week. They are by past students of the Lambeth School of Art, which for many years had close relation with the art work of Messrs. Doulton's establishment. In addition to the pictures, there is also shown a collection of vases and other objects worked, in their hours of recreation, by men engaged at the Doulton potteries.

The Bristol Society of Architects held a meeting last week, Mr. Frank Wills, president, in the chair Mr. John Fisher, head-master of the Kensington School of Art, Clifton, read a paper on "The Life and Work of Alfred Stevens," dealing with the early struggles and training of the great sculptor, painter and designer, whose life work culminated in the magnificent monument in St. Paul's Cathedral (unfortunately still incomplete) to the great Lord Wellington.

The Chancel of All Saints' Church, Hundon, has been restored. The repairs were effectually carried out under the direction of Mr. Fawcett, of Cambridge, by Mr. W. Bareham, of Clare, the woodwork being undertaken by Mr. Cowle, of Clare. An entirely new roof has been constructed, and four new traceried windows with cathedral glass have been erected. The new gable of flintwork is surmounted by a new cross, this and the windows being of Ancaster stone. The walls of the chancel have been scraped, cleaned and coloured a dark red, and will be completed with stencil decoration. The interior of the roof has a framework of English oak, and is filled in with plaster panels.

Restoration at Exeter.—The Custos and College of Vicars of Exeter Cathedral started a fund for the restoration of the College Hall in South Street. The hall was built by Bishop Brantyngham in 1388 as a refectory or dining hall for the vicars choral of the cathedral, then twenty-four in number, now twelve. The same benefactor also completed the buildings in Calendar Hay, near by where the vicars resided in chambers until about the beginning of the last century. The hall has undergone necessary repairs from time to time, the last about sixty years since, but there have been no structural alterations. About £120 is required, towards which nearly one-half has been promised.

New Buildings at the Hereford County and City Asylum at Burghill were opened recently. Messrs. Giles, Gough & Trollope were the architects. The additions consist of a two-storey block for 100 females and a one-storey block for 50 males, for epileptics, matron's and medical officers' rooms, attendants' mess-rooms, large additions to the dining-hall and chapel, and an extension of the kitchen. In addition, the laundry block has been entirely remodelled and large additional accommodation provided. The main building contract has been carried out by Messrs. W. Bowers & Co., of Hereford. Mr. J. C. M. Vaughan, Fellow of the Institute of Decorators, of Hereford, has had the contract for the whole of the decorations and painting.

Engineering Notes.

The New Line of the City and South London Railway Company, from Moorgate Street to Islington, was opened for public traffic last Sunday morning.

The Surveyors' Institution held its first ordinary meeting of the session last week. Sir John Rolleston delivered his presidential address, which dealt chiefly with agricultural rating.

A New Stone Bridge at Dryslwyn over the Towy, which has cost the Carmarthenshire County Council nearly £12,000, was opened recently. The bridge has been erected near the railway station and immediately above are it the ruins of Dryslwyn Castle. Mr. Thomas Codrington, C.E., of Twickenham, ex-inspector of the Local Government Board, was the engineer. It was found necessary to go down nearly 60ft. in the bed of the river for the foundations of the north pier. The bridge, which is somewhat ornamental, is 17ft. wide and built of local limestone from Castellgarreg, Maesybont. It has three spans, the middle one being 57ft. and the two side arches 25½ft.

Surveying and Sanitary Notes.

The Board of Trade and Street Upheavals.—The Westminster City Council has revoked its resolution of October 24th in favour of the County Council, substituting the Board of Trade as the appeal authority in all disputes relative to the breaking up of roads.

Bacterial Sewage Purification at Skipton.—The Skipton Urban Council, having been pressed by the West Riding Rivers Board to improve the purification of the town's sewage, have been recommended by their surveyor (Mr. J. Mallinson) to adopt a scheme of treatment on the bacteriological principle, and further means of land filtration. The Council have decided to consult Mr. Mawby, borough engineer, of Leicester.

The Sanitary Assurance Association.—At the monthly meeting of the Council of the Sanitary Assurance Association, held at No. 5, Argyll Place, Regent Street, W., last week, Mr. Andrew Stirling in the chair, the death of General H. K. Burne, C.B., was reported; and on the motion of Sir Vincent H. Kennett Barrington, seconded by Mr. W. S. Halsey and supported by Dr. Willoughby and Mr. Mark H. Judge, a resolution was adopted acknowledging the services which General Burne rendered to the Association during the seventeen years he was a member of the Executive Council.

Builders' Notes.

Mr. Edward Noble, builder and contractor, of Spring Street, Rishton, died recently at the age of fifty-seven years. During the past few years Mr. Noble has been responsible for the greater number of the new houses erected in Rishton, and one of the streets is named after him, "Noble Street." He was one of the largest property owners in the township.

Building in Bradford.—The Building Committee of the Bradford Corporation during the twelve months ending August 31st last approved 445 plans out of 1,160 deposited. Included in the plans approved were 1,145 dwelling-houses, twenty-one houses and shops, twelve warehouses, four mills, sixteen workshops, two places of worship, twenty-five lock-up shops, fifty-four streets and ninety-two back roads. Plans were also approved for five board schools, two poor-law relief stations, two tall chimney shafts, and the electricity generating station. There was more activity in the building trade than in the previous year, but less than in either 1898 or 1899.

London County Council.—At last week's meeting the following recommendations of the Highways Committee were approved: "That the Council do apply in the next session of Parliament (1) for powers to make subways in streets for the reception of pipes, wires and other things where desirable, and for electrical traction and other purposes of locomotion; and (2) powers to construct a subway and to construct tramways therein for electrical traction from the Victoria Embankment, along Wellington Street, across the Strand, through the new street thence to Holborn, under Holborn and Southampton Row, and to take such tramways, by an inclined plane, to the tramways terminus in Theobald's Road, or to the tramways authorised to be constructed in Rosebery Avenue, as may be considered most expedient." It was also agreed to make an application in the next session of Parliament for power to construct an underground conduit system of electric traction for the County Council tramways at Camberwell Green via Denmark Hill, Champion Park, Grove Vale, and Lordship Lane to the Crystal Palace Road. The length of the new line will be 2½ miles, and the cost of construction £68,650. The street widenings required will cost £114,950. Subject to the Lee Conservancy Board contributing £5,000, it was decided to rebuild Bow Bridge at an estimated cost of £21,200. The tenders of Messrs. Dick, Kerr & Co., Ltd., for plant at £25,964 and £46,625, necessary in the electrification of the South London tramways, were accepted.

Building in Glasgow.—New work to the value of £50,000 was passed last week at Glasgow Dean of Guild Court.

The New Cottage Hospital, Cranleigh, is being warmed and ventilated by Shorland's patent Manchester stoves and grates, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

A Builder's Bankruptcy: Liabilities nearly £128,000.—In the Court of Bankruptcy last week a first meeting of creditors of W. G. Hornsey was held. The debtor, who was described as of 205, Vicarage Lane, West Ham, builder, furnished a statement of affairs showing gross liabilities £127,874 11s. 5d., of which, however, £9,337 8s. 7d. only was returned as expected to rank, and assets, consisting of cash 5s. 9d. and an estimated surplus of £67,093 7s. 11d. from securities held by creditors. It appeared that the debtor began business as a builder in 1881, and in 1887 built the Premier Hotel, Piccadilly, and the Marlborough Hotel, St. James's, at a cost of £95,000, most of which was raised on mortgage. The debtor attributed his failure to inability to realise shares in a brewery at Kempton and in hotels. No offer of composition was now made to the creditors, and Mr. John Woodthorpe, chartered accountant, was nominated as trustee to wind up the estate, with the assistance of a committee of inspection.

COMING EVENTS.

Wednesday, November 20.

Ruskin Society of Birmingham.—Mr. Howard S. Pearson on "The Pathetic Fallacy," 7 45 p.m.

Northern Architectural Association.—Students' Evening.

Dante Society. Lecture by Dr. Hodgkin, 3 p.m.

Society of Arts.—Opening Address by the Chairman of the Council, Sir William Henry Preece, K.C.B., F.R.S., 8 p.m.

Thursday, November 21.

Royal Academy.—Demonstration in Anatomy: The Trunk and Upper Extremity. By Prof. Arthur Thomson, M.A., 4 p.m.

Royal School of Military Engineering, Chatham.—Mr. Edwin O. Sachs, on "Fireproof Construction."

Friday, November 22.

Architectural Association: Discussion Section.—Mr. G. H. Smith, on "The Architectural History of Canterbury Cathedral." 7.30 p.m.

Glasgow Technical College Architectural Craftsmen's Society.—Mr. George Herbertson on "Foreign Competition in the Building Trades," 8 p.m.

Birmingham Architectural Association.—Mr. J. A. Gotch, F.R.I.B.A., on "Architecture of the Eighteenth Century in England."

Saturday, November 23.

British Institute of Certified Carpenters. Visit to Vauxhall Bridge Works at 3 p.m., by permission of the resident engineer, Mr. E. P. Wells.

Monday, November 25.

Surveyor's Institution.—Mr. A. Dudley Clarke, on "The Final Report of the Local Taxation Commission," 8 p.m.

Royal Geographical Society.—Major Molesworth Sykes, on "Four Years' Travel and Survey in Persia," 8.30 p.m.

Royal Academy.—Demonstration in Anatomy: The Upper Extremity. By Prof. Arthur Thomson, M.A., 4 p.m.

Tuesday, November 26.

(Oil or Pneumatic Check Action).
FANLIGHT OPENERS. New Patterns.
PANIC-EGRESS BOLTS. Approved by the L.C.C

Trade and Craft.

Ventilation.

Four sectional catalogues have just been issued by Messrs. Robert Boyle & Son, Ltd., of 64, Holborn Viaduct, E.C. Three of them deal with the system of natural ventilation as applied to churches, schools, hospitals and asylums, while the fourth is descriptive of the patent "air-pump" ventilators and other ventilating appliances. Apart from their being trade catalogues, they will be found of considerable utility to architects, as they contain much information on the subject of natural ventilation and are illustrated by a number of diagrams. In regard to the ventilation of churches, which is so important a matter, it is pointed out that the vitiated air should be extracted at the highest part of the building, where it ascends naturally, and the fresh air admitted at or below the breathing level, in an upward direction and at a low velocity, through brackets or tubes distributed around the walls. The system has been applied to numerous churches throughout the country—such as St. John's, Leonard's-on-Sea, and St. Mary's Redcliffe, Bristol (both under the direction of the late Sir Arthur Blomfield). With regard to hospitals, in view of the present outbreak of small-pox in London it is interesting to note that the hospital ship "Castalia" is ventilated on Boyle's system, which, after careful inquiry, was selected as the best and most suitable for the purpose. The system is so well-known and so widely adopted that there is no need now to dilate on its merits. It is sufficient, in noticing these new catalogues, to say that experience has proved the system of natural ventilation to be thoroughly effective.

LIVERPOOL CATHEDRAL:
A Protest and Petition.

ARCHITECTS and other Artists have taken a decided exception to the scheme for obtaining Designs for the above Cathedral. The Editorial Committee of The Architectural Review has devoted a considerable portion of the November Issue to a Protest and Petition against the Conditions of the Competition.

The Protest takes the form of expressions of opinion from the following:

EDWIN A. ABBEY, R.A.,
SIR L. ALMA-TADEMA, R.A.,
JOHN BELCHER, A.R.A.,
REGINALD BLOMFIELD, M.A.,
WALTER CRANE,
SIR THOMAS DREW, R.H.A.,
HEN. HARTLEY, F.R.I.B.A.,
T. G. JACKSON, R.A.,
W. GOSCOMBE JOHN, A.R.A.,
F. C. PENROSE, M.A., F.R.S., Litt.D., D.C.L., F.R.I.B.A., F.S.A.,
Professor BERESFORD PITE, F.R.I.B.A.,
W. H. SETH-SMITH, F.R.I.B.A., Pres. A.A.,
HAMO THORNYCROFT, R.A.,
ASTON WEBB, A.R.A.,
G. F. BODLEY, A.R.A.,

AND MANY OTHERS.

The questions of SITE and STYLE were fully dealt with by Professor SIMPSON and Mr. E. S. PRIOR in the OCTOBER Issue of The Architectural Review.

AT ALL NEWSAGENTS AND BOOKSTALLS.

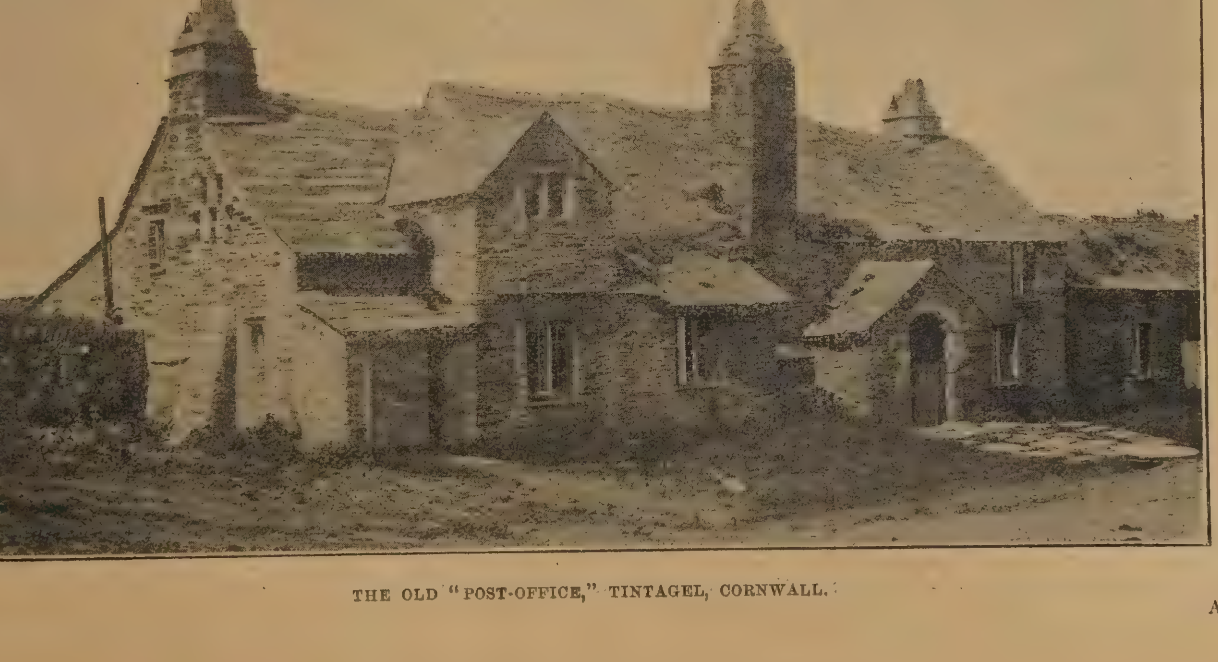
An Architectural Causerie.

Bricklaying. THE facts about the modern bricklayer which have been so excellently set forth by the "Times," though familiar to the majority of architects and builders, are so collected and summarised that the inferences to be drawn from them must demand the attention of everyone connected with the building trade. The question—How many bricks should be laid in a day?—has been periodically raised for many years, but perhaps the most succinct answer to it is that given by "An Honest Bricklayer" in our issue for August 15th, 1900: "It all depends on who is watching him!" Mr. Thomas Blashill dealt with the matter in the paper on "The Present Condition of the Building Industry" which he read before the Surveyors' Institution last March, when he pointed out that the desire to have an easy time was common among time-workers of every class, but that a more serious matter than mere idleness was the deliberate loitering which masters complain of. The "Times," however, in addition to proving that the unwritten law of bricklayers is to lay not more than 400 bricks a day (which is less than half the number formerly laid), goes on to show that the plasterers, masons, and other building operatives, are similarly negligent; and for this general laxity trade-unionism is held mainly responsible. The facts which bear out this contention can be read in another column. However, master-builders have long had to face these difficulties, and it is the remedy rather than the statement of the case which now demands attention. At the present time, with a standard rate of wages, a good bricklayer is paid just the same as a bad bricklayer; and, moreover, the chances are that if the master-builder discharges the latter the trade-union will take up the cudgels and perhaps a strike will result. Now, it is evident to anyone who considers the matter logically, and with an unbiased mind, that it is for the benefit of all concerned that the relations between employer and employed should be more amicable than they are at present, for strikes spell nothing but disaster to one party or the other, or to both. We would suggest that, with this object in view, the masters' associations and the trade-unions, instead of equipping themselves like combatants ready to fight on the slightest provocation, should approach each other and consider the feasibility of forming joint boards in every district, so that when a bricklayer proposed himself as a member of the trade-union this board would test his qualifications—say, by requiring him to set out and rub an arch, and to bond difficult work. In this way only competent bricklayers would be admitted into the union, and the trouble caused by incompetent labourers usurping the place of the bricklayer, and receiving the same wages, would be avoided. Boards on the same principle have been constituted for the registration of plumbers in this country, and their usefulness is proved. The masters should not recognize incompetent men as trade-unionists, and should refuse to pay them union rates of wages. It is not to be expected that such an arrangement as we have suggested (which is simply that of the old craft guilds) would be a panacea for all the evils, but it would be a move in the right direction, and improvements might follow. It may be contended that, even under these conditions, the thoroughly competent and hard-working bricklayer would be no better off than the lazy bricklayer who was only moderately competent; but this argument can be refuted on the ground that, while the former would be certain in his employment, the latter's incompetency would assure his discharge at the earliest opportunity. Matters can only be made worse if masters and men insist on maintaining an attitude of belligerents, and it is much to be regretted they should not generally see that it is to their mutual welfare to be on better terms, even though some masters be brutes and some workmen ignorant blockheads.

Tintagel Post-Office. IN the village of Trevena, better known as Tintagel, in Cornwall, stands a curious little cottage whose deep-set porches and irregularly-sloping roof of heavy slabs of slate have long been the delight of artists. Locally known as the "Old Post-Office" (having at one time served that purpose), its plan is that of a fourteenth-century house—small indeed, but sufficiently commodious—its low construction and massive walls protecting the inmates from the fury of the Atlantic gales. Entering through one of the heavy doors which shelter behind the porches the visitor finds himself in a passage communicating with a large sitting-room open to the roof, having a huge stone fireplace and cosy window seats in snug recesses. A low-roofed kitchen and caretaker's room adjoin the sitting-room, over which hangs a gallery, probably once used to sleep in. Three bedrooms, curiously placed, complete the accommodation, and over all stretch the great roof timbers, black with the smoke of ages. In 1895 the building was put up for sale by auction, and it was feared that it might be bought with the object of clearing the ground and rebuilding. It was then that Miss Johns purchased it with a view to its preservation, and a number of artists by the sale of their works made a handsome contribution towards the cost of putting it into repair, which work of repair was entrusted to the Society for the Protection of Ancient Buildings. The National Trust has now the opportunity of becoming the owner of this interesting specimen of fourteenth-century architecture, the terms being that they pay £200 down and grant Miss Johns a lease of the building for her life-time at a nominal rent. They appeal for help to raise the necessary £200, of which about £150 is still required. Donations should be sent to the secretary of the National Trust, 1, Great College Street, S.W., by whose courtesy we are enabled to publish the accompanying illustration



THE OLD "POST-OFFICE," TINTAGEL, CORNWALL.

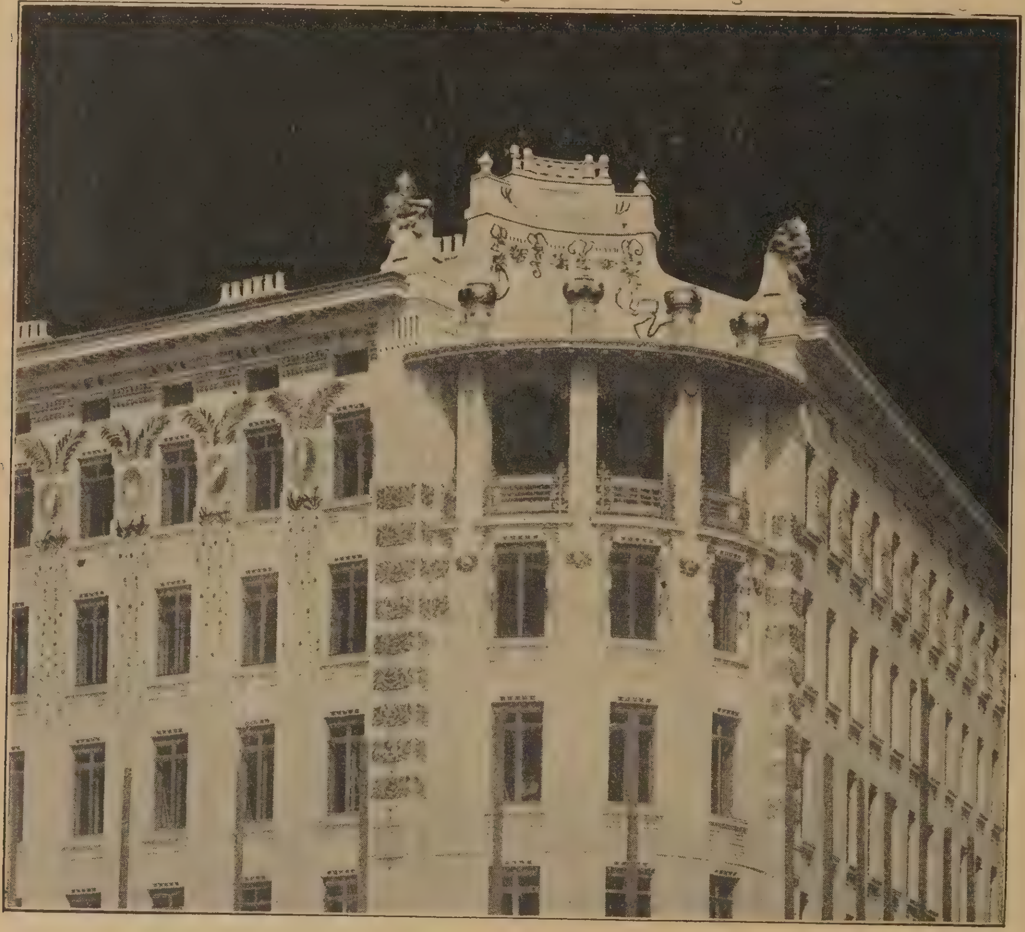
MEN WHO BUILD.

No. 67.—OTTO WAGNER and T. M. OLBRICH (of Vienna).

By ALFRED W. FRED.

IN the second half of the last century forces gathered from a thousand sources, pure and impure, out of which arose the revival of art in Vienna. After a colourless and spiritless epoch (broken only in the domain of painting during the short though powerful ascendancy of Hans Makart) had lasted almost a century since the time of the Congress, such an expansive force developed in the veins of both artists and public that, upon the rising of a young artistic feeling and the revolution of the creative faculty, the transformation of the public followed with a speed and power till then unknown. Culture and art in the individual had been discouraged for so long that when at last the cry for the new art became evident in Vienna it was soon found that the first prophet was also the best. Of course, even here there had been pioneers of this new modern art. What happens in the history of every development may be observed here: that decades before the time when the great turn in the direction and art of conception occurs, Nature inspires whole-hearted artists, who at the period in which they live—about a generation in advance of their time, despised by their comrades—give expression to all the desires which became a fighting programme for their successors, and later still a dogma. Vienna can show in the world of art such men ahead of their time. In the front rank of all stands Otto Wagner, the greatest modern European architect I know of. In painting, perhaps, Th. v. Hormann should be named, for a time a "plein-air" painter when the school of Barbizon was but little appreciated by the Germans; but certainly the South Tyrolean, G. Segantini, should be mentioned—famous to-day, though ten years ago an independent and ingenious art-pioneer of the "pointillists." These men were the lights of the new art in Austria. No doubt they had colleagues, only they are not all known, for many were unable to see the fulfilment. Death took some, and others were not robust enough of talent to ripen without the encouragement of their contemporaries. The succeeding generation, as already stated, united all the latent revolutionary vigour, all the earnestness, all the love of novelty, which also contains potent sources of art development; and at last, in the year 1896, the age of the new art opened in Vienna. The separation of a group of painters from the community of art, and their constitution into a fresh society, gave the name of "Secession" to the new movement. The word became a power. Society took it up, coarsening and depreciating its spirit. Certain elements of the new art were considered its soul; and all the confusion that indicates a hot "culture" struggle set in. These five last years of the nineteenth century were the most important of the age in the development of Austrian art; architecture, as well as painting, began to get intimate with life. It is impossible to imagine such an inartistic civilization as to essentials as that of Austria from the year 1870 to the year 1895. Many latent desires existed which found no fulfilment; narrow, separate and exclusive circles exercised an old-fashioned interest in the collecting of antiquities; painting was academical, dark, lifeless—more science than art; and in architecture, which in all ages is the clearest indicator of the level of civilization, there was seen the artistic incohesiveness of the time in the tendency to adopt all historical styles.

As the first Electrical Exhibition illustrated the civilization of the century, and the Paris Exhibition of 1899 produced the Eiffel Tower as a monumental example of architecture in ironwork, so the new Burg Theatre was completed as the last of a whole series of Hellenising structures, such as the Parliament House and the University. Taste changed from one historical style to the other. The need for a living style remained unappreciated so long that no one realized that nothing new could result from copying the past and that "style" could only be the continued artistic force of its time.



CORNER OF APARTMENT HOUSE, VIENNA. OTTO WAGNER, ARCHITECT.

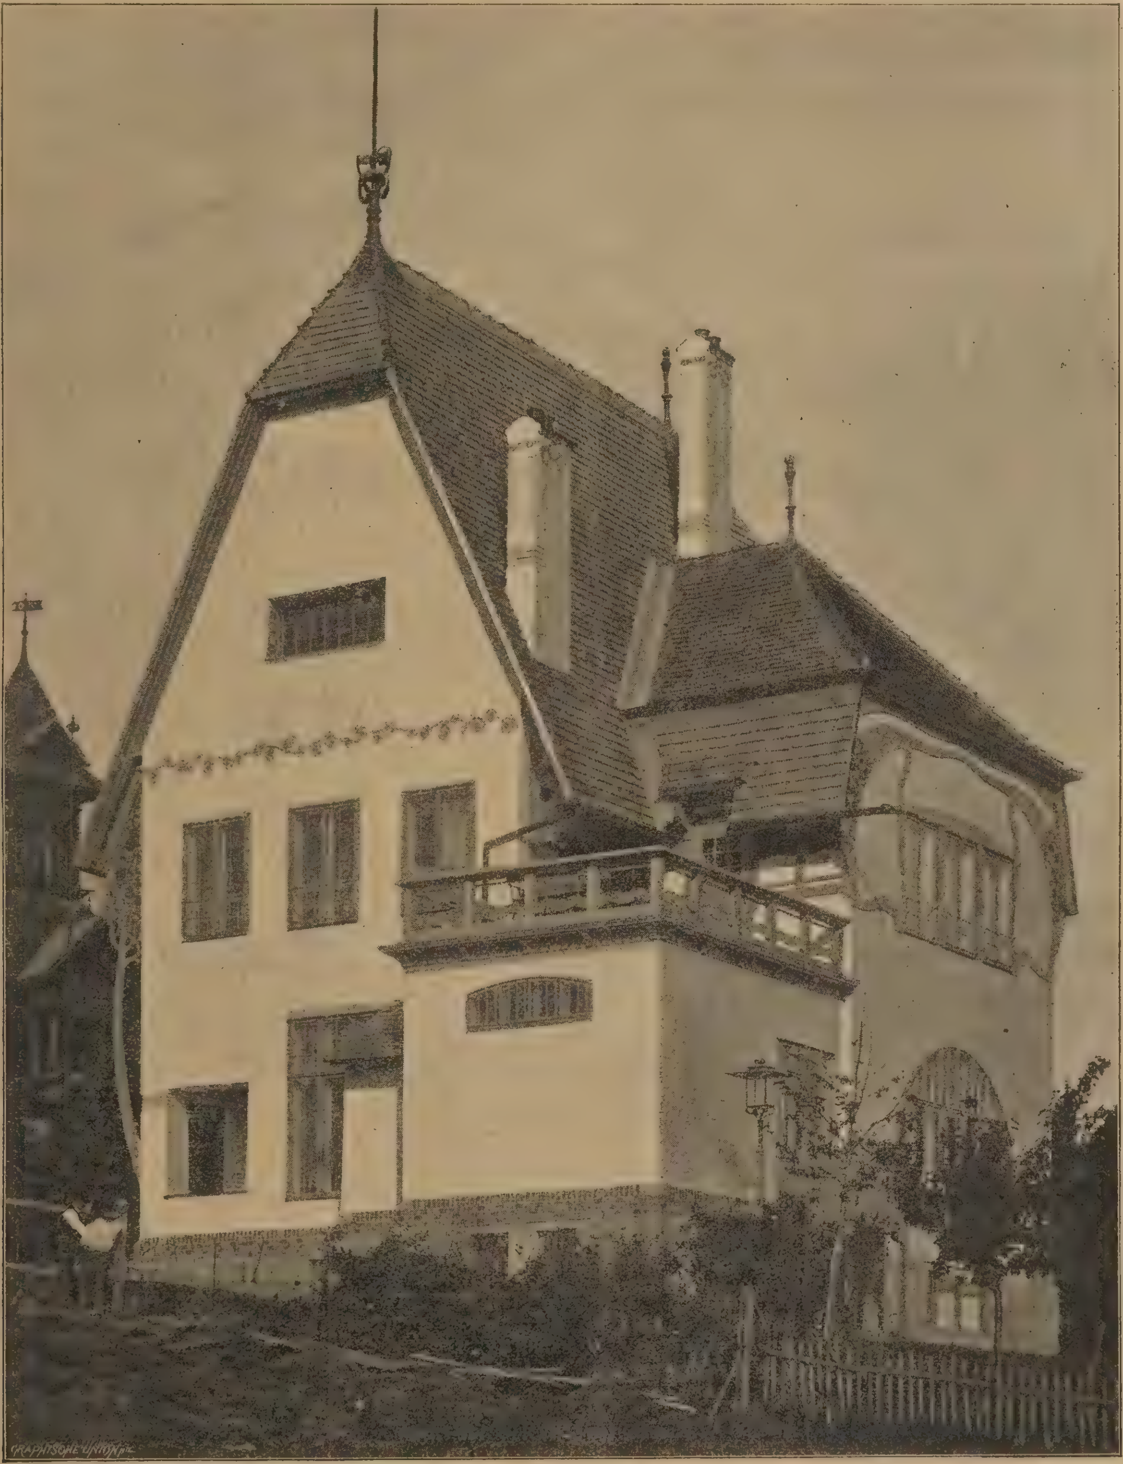
Otto Wagner, of Vienna, came to realise this, and he did not hesitate too much on his way. It can be said of nobody of the last generation that he acquired his style of art, architecture or painting wholly by independent uninfluenced thought or by his own experience. Otto Wagner received no assistance except from life itself, from work and experience, and from modern technique. His ideas have, of course, had their preparation in the lines of thought of all past times, but Wagner learnt nothing from his contemporaries. Thus he is one of the very first, not a forerunner but a leader—a finger-post. To-day, at sixty, he has scholars who are choosing their own way, but his own work is far from being finished. With every year and every new project his powers grow stronger, and it is a rare and wonderful sight to witness how the sexagenarian in the last decade of his life maintains the courage and the daring of his ideas. His book, "Moderne Architectur," published by A. Schroll, of Vienna, should be read by every architect. He believes that an architect attains the full power of his creative faculties only after he has reached his fortieth year—as one has so much to learn up till then, not so much from the works of others as from personal experience. Wagner adopts this view from his own life. He was educated in the Berlin and Vienna academies. Siccardsburg was really the Austrian master to whom he was indebted for his strongest impressions as a student. But it can only be said of the works he did between his twenty-fifth and his fortieth year, that they were the means to an art development; they were stages on the way. This master, whose name may easily rank with those of Fischer von Erlach, Von der Null, Siccardsburg and Godfried Semper, matured slowly; in fact, he lived at a time when rapid development was in no way favoured. To-day a man may be already famous at twenty; he may clearly assert his personality in his works by then. But it was not so in the 'sixties and 'seventies, and, as Wagner himself has said, architecture is not an art that offers many possibilities to youth. It is the art of matured manhood.

It is self-evident that no architect in his first work shows completely that art which, in his riper years, sets forth his greatness. But it is also evident that every great artist betrays in his earlier works what his subsequent style will be. Every observer of Wagner's early works must see that the peculiar power of the master lies in the bold features of his conception. The plan means everything; for external detail he has never had anything to spare. Organisation and harmony in the ground plan and facade are the features of the Wagner buildings.

Much will be said in what follows about the views of the master, for his personality has influenced art and artistic pursuits in Vienna in quite an unprecedented way, and his existence closes one period of modern artistic style.

The Wagner buildings of the end of the year 1870 to the year 1880 betray the influence of Fischer von Erlach and Godfried Semper, and they often show also the traits of a free Renaissance. Then, later, one detects a tendency to an "Empire" character; this is seen in the frequent and known employment of broad and straight lines, which Wagner to-day, more than before, considers essential to modern architectural design. From the middle of the year 1880 Wagner becomes less constrained; he frees himself from the last vestiges of the student's recollections and from the powerful traditions of Vienna. His works then become the pictures and products of the present. Godfried Semper's proverb, "Artis sola domina necessitas," is his watchword. He concedes no other idea to construction but the end or object, no other beauty but comfort (this word must be taken in its wide, free and modern sense). Hereafter the character of Wagner's style of architecture cannot better be indicated than by referring to some of his views. There are few artists with whom theory and practice work so well together.

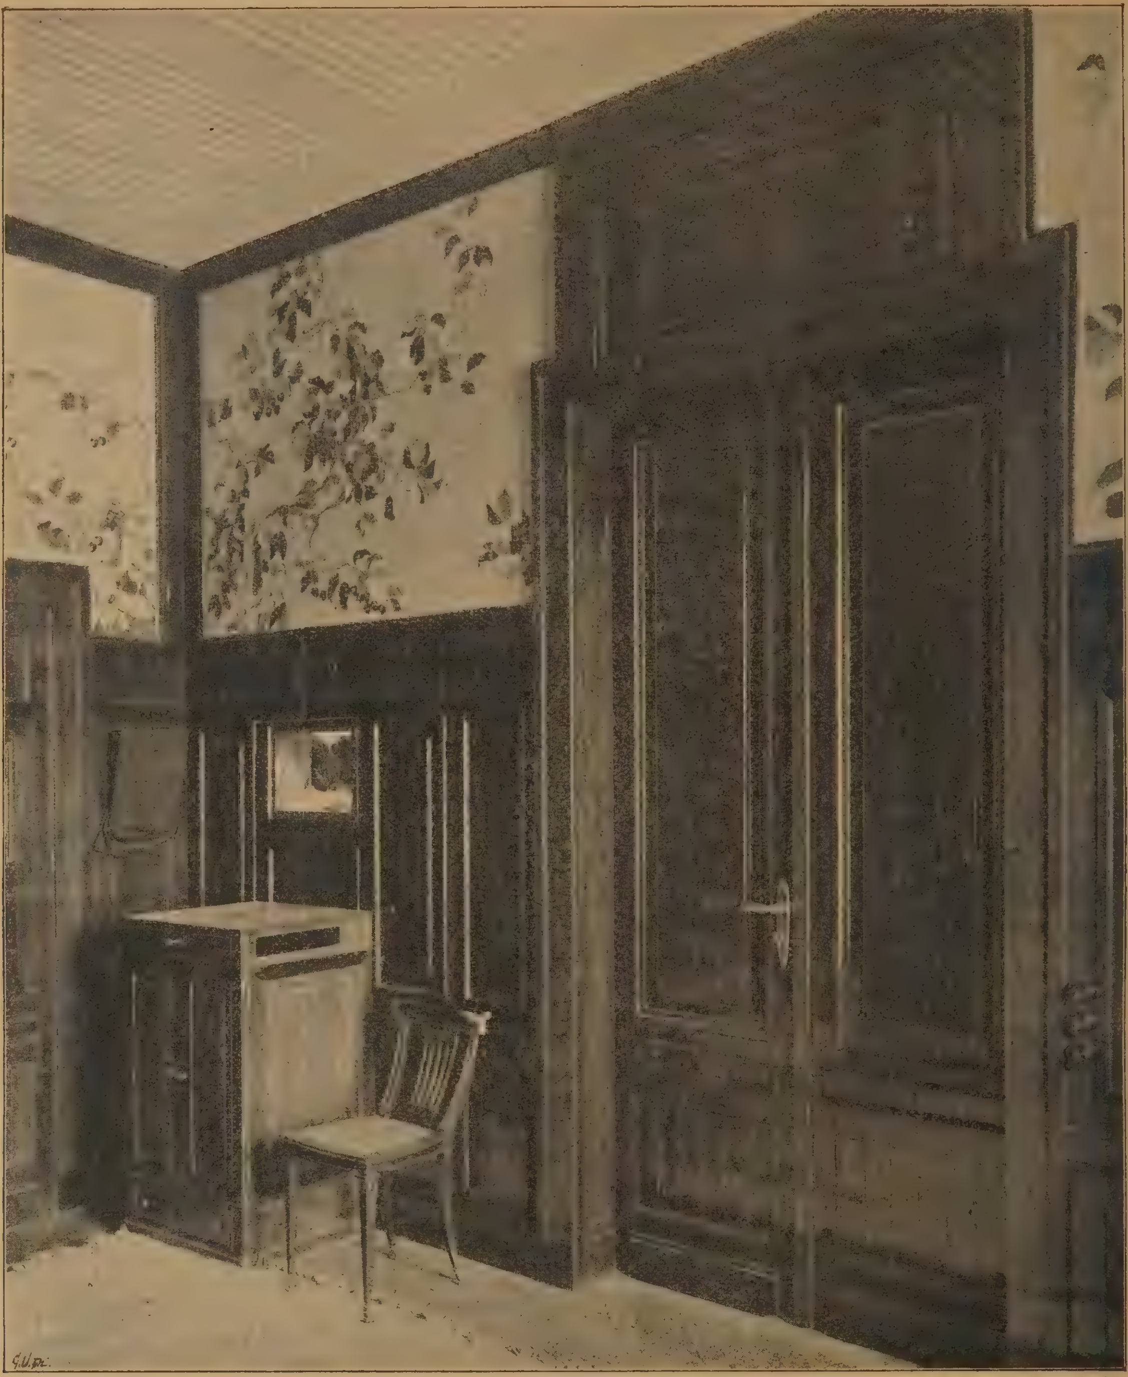
I have already spoken of the independence and freedom from tradition which Wagner considers a condition to good modern architecture. To believe the "Eureka" to be in this or that style, appears child'sh, and the really educational stimulant in art will certainly exclude such a tendency. But this higher and educational reform, as well as the use of all ideas and materia!s, must force us on towards a new style, the more so because this style of the future will be a utilitarian style; and by "Nutzstil" (utilitarian style) Otto Wagner means that style whose only beauty is the form of construction.



HOUSE AT VIENNA. T. M. OLBRICH, ARCHITECT.

As a first necessity Wagner recognises the abolition of anachronisms in art. Churches, dwellings, theatres and monuments must all be built after the same ground plan if they are to suit their ends, the dwellers and users. He holds that anything unpractical cannot be beautiful, and that every application of ancient forms must be unpractical on (so to speak) obvious æsthetic grounds. Wagner sets aside *a priori* all fixity of style. He takes no account of the employment of a basis of style, even if on a small scale. Every style is so born of the earlier one that new constructions, new materials, new human objects and considerations become joined to the preceding ones, and thus are created new models. An objectless movement to find a new style is considered by Wagner to be as unprofitable as it is foolish—a most gratifying view at the present time. Extreme artistic economy, dignity in the employment of materials, building to an end, no other ornament than the arrangement suited to the building, the greatest simplicity and symmetry—these are the rules of Wagner's architecture, and to them must be added the lesson not to build in styles. Each purpose produces its own design; and the same conditions as to purpose, position and material proportions may be repeated in various buildings.

A series of great Wagner productions already show a visitor to Vienna how faithfully the master harmonised his practice with his theory. Most prominent there is the State railway station, which is a witness that this architect's principal force is his boldness of conception. Here all technical difficulty is not only brilliantly overcome, but has grown, so to speak, even out of faults. The small space available for the station buildings has been cleverly utilised, and through the characteristic outline of the ever-varying but quite simple pavilion in white plaster, with green-lined ornamentation, the city has acquired a particularly effective addition. The harmony observed throughout the whole establishment and the simplicity of each portion of the details,



INTERIOR. OTTO WAGNER, ARCHITECT.

windows, doors, catches, &c., are the result of an inexorable strength of logic, to derive the form of everything from its "comfort," object and use. The other buildings of Wagner show the same main features. Visible cross beams, a clear facade exposing the interior arrangement, the wonderfully graceful though not at first sight imposing staircases, are the special qualities of his dwelling-houses.

During later years he has freely employed colour for his facades, but the way in which he uses it is so safe that one cannot speak of a wandering from the spirit of architecture, but only of enlarging architectural limits and possibilities. In this his students are less reliable, as may be seen from certain samples in the work "Aus der Wagnerschule," published by A. Schroll & Co., of Vienna.

As an architect of interiors Wagner comes still from the Makart age. This can be clearly seen in his works of the year 1880. He had first to break himself loose from the carved ceilings, heavy stuffs and unmeaning ornaments, and in this also he was was the foremost in Vienna. He employed his architectural ideas wholeheartedly in the interior equipment, only here he enjoyed greater possibilities in the matter of colouring. Otto Wagner is a prime factor as a stimulator in Austria, and, indeed, in modern Continental architecture. There is no young artist in Vienna who does not owe him much.

T. M. Olbrich is no scholar of Wagner's, but like the great Vienna architects, Josef Hoffmann, Max Fabiani, Leopold Bauer, he served for a time in his workshop. There is some of Wagner's spirit in Olbrich. The leading ideas of the new art practice, appreciation of uses and beauty of purpose, have also entered his blood. But a world lies between Wagner and Olbrich. Their work may be similar in spirit, and the chief capacity of both men lies in the same direction—both are great in conception and design—yet Wagner is at the one pole and Olbrich at the other in Austrian decorative art. There may be works that indicate presumably their mutual sympathies, which seem to attract each other; and it may even be that the one appreciates the other. To me the existence of these two appears a complete contradiction. Otto Wagner builds for people of to-day. His architecture is logic translated into thought by an artist. He is a man of the present. His art must have as its highest aim the expression of modern life at the highest limit. Olbrich's architecture has other aims. He is rather a free artist than an architect. He builds less with an eye to the present than to the future. He designs houses not for those who order and pay for them, but for the children who will be born and brought up in them. "Perhaps," he may say, "the interior I am now planning will not suit these people. They are too fine, too subtle, too clear and too phantastic, too artistic and too uncitizenlike. But children grow up there whose early years, through the colours of my ceilings, friezes and walls, will be educated to artistic conception and so will be cultivated."

We must indeed often see this carried out in Olbrich's works. A house or room is built according to the needs of their future users. "Olbrichism" would revolutionise (metamorphose) the inhabitants. One is forced to think half in earnest and half ironically on the phrase of Ruskin: "Each man must work to better his kind, even if he himself doesn't wish it." The good and bad sides of Olbrich's art are clear. That environment changes men is unquestionable.

To me there is no doubt that the next generation will see a much more developed colouring and sense of outline than we do. But to cultivate a man by the rooms of his house seems to be very far-fetched. There is an element that, united with many others, must have good results, but the question is otherwise an open one—whether the artistic phantasy of a man may be strong and reliable enough to excite the following generation, or an exciting and fantastic be decreed as too theatrical.

T. M. Olbrich is doubtless a genial architect. His defect lies in his being too anticipatory, and moreover his construction is often not sufficiently secure. His fancy misleads him to constructions which are artistic shams. For a long time he has employed far too many curves—even boxes and beds he works out in curves; but he appears to have calmed down now. He has, however, done much for Viennese decorative art, though he has now left the city and is building for the Grand Duke Ernst of Hesse-Darmstadt his "Artists' Colony." If he could limit his fancy within architectural bounds he could do much. His activity is now often only a promise for the future. It is not the time to speak further of the other Viennese artists (J. Hoffmann, Adolph Loos, Leopold Bauer, &c.). I am now dealing only with Otto Wagner and T. M. Olbrich, for they are the characteristic representatives of the new Viennese style, and up till now have most increased the store of design.

[NOTE.—*We do not hold ourselves bound by the opinions expressed in this article, nor do we necessarily commend all the buildings illustrated. Our object in publishing the article is to give readers in this country an idea of the aims and methods of modern Austrian and German architects.*—ED. B.J.]

THE PROPOSED OFFICE BUILDING FOR THE STRAND.

AT a cost of £2,000,000 it is proposed to erect on the Strand an office building, on American lines, which it is asserted will be "the largest and handsomest structure of the kind in the world." The English-American syndicate who have the matter in hand submitted to the London County Council last Wednesday a written application for a 999 years' lease of the island site, with a small exception, fronting upon that portion of the Strand now being cleared for the Crescent Road in connection with the new thoroughfare to Holborn. This represents the space between the Law Courts and Wellington Street. The exception lies at the Wellington Street end, where a corner site that will be divided from the remainder by a short roadway is reserved for the Gaiety Theatre and two other buildings. The site of the proposed building has a frontage to the Strand of 750ft., with even longer frontages to the adjoining new streets which are being opened. It has an area of 125,000 sq. ft. The architect's drawings, which accompany the application, show that the entire building will be seven-storeys high, but a portion will have three more storeys, the whole of steel construction, with sandstone exterior. One of its special features will be a rotunda, under a lofty dome, in the centre of the building, intended to form a general rendezvous. The basement will consist of extensive safety-deposit vaults, a large restaurant, engines, boilers and machinery for furnishing heat and electric light, and the power necessary for running thirty lifts. The ground floor will contain special accommodation for banks and insurance companies requiring large rooms, and for shops. The upper floors will be given up to offices. It is estimated that the actual floor-space available for letting purposes will amount to 900,000 sq. ft., and that there will be more than 6,000 rooms in the building. It is also estimated that the annual maintenance charges will be about £35,000, and that the construction will probably take 2½ years.

The Competition for Walton-on-Thames Municipal Buildings, &c., has been decided in favour of Messrs. Mackintosh & Newman. The second premiated design is by Mr. George Sedger, and the third by Mr. Sidney Tatchell, all of London.

Law Cases.

Hastings Builders' Bankruptcy.—The statement of affairs of Messrs. Moon & Garner, builders, of Hastings and Bexhill, shows liabilities amounting to £16,719 and assets £2,835, leaving a deficiency of £13,833 15s. 4d.

A Crawling-Board is not "Scaffolding" within the meaning of section 7 of the Workmen's Compensation Act. This was the decision of the Master of the Rolls in the case of *Veasey* v. *Chattle*, which came before the Court of Appeal on Saturday last.

Menacing an Architect.—At Bow Street Police Court last Friday William Edge, who was charged with threatening Mr. James Neale, architect, of Bloomsbury Square, with a revolver (as reported on p. 254 of our last issue), was bound over in £200 to keep the peace, finding two sureties in £100 each.

Abortive Prosecutions.—At the instance of the Knaresborough Urban District Council five charges of breaches of the building by-laws were recently preferred at the Knaresborough Petty Sessions against Mr. Joshua Naden, builder, and a former member of the Council. The first charge was that the defendant commenced to build a stable and shed in the yard of the Crown and Cushion Hotel without having notified the surveyor. For the defence it was contended that the erection was not a new building, and did not come under the by-law. The case was dismissed, whereupon two other charges bearing on the case also fell through. The fourth charge was that the defendant had commenced a new building in Raw Gap without giving notice in writing to the surveyor. It was stated that he was converting three coal-houses into a wash-house. This case was also dismissed, the defence being that it was not a new building. The fifth charge was that the defendant broke open the road in Briggate without the sanction of the Council. The Bench also dismissed this case.

LEEDS AND YORKSHIRE ARCHITECTS.

THE opening sessional meeting of the Leeds and Yorkshire Architectural Society was held at Leeds on Thursday last, the president (Mr. Butler Wilson) occupying the chair. During the evening prizes were distributed to the successful students. Mr. S. R. Day, of Skipton, won the prize for measured drawings, and to Mr. J. Hinchcliffe, of Chorley, four prizes (making a total of eleven guineas) were presented. A letter was read from Mr. George Corson presenting to the Society the portrait of himself (by Mr. H. Willson) which had been given to him by the members of the Society. Mr. Corson was the Society's first president when it was founded twenty-five years ago.—Mr. Butler Wilson, in the course of his inaugural address, urged students to be enthusiastic in their work, and to thoroughly search into the details of their art; and there could be no better foundation on which to build the temple of their education than working for the qualifying examinations of the Royal Institute of British Architects. To practising architects he offered the suggestion that unselfishness should be the keynote of their work. With regard to competitions, he considered their conditions were usually unfair and unreasonable, and with the object of inducing persons to proceed on proper lines the Society proposed to appoint a standing Competitions Committee; and whilst speaking of this matter the president referred to Liverpool Cathedral, expressing the opinion that the commission should be placed with Mr. Emerson, the winner of the competition held fifteen years ago. In conclusion he drew attention to the arts and crafts societies; one should guard against a tendency to stifle new and crude ideas and should give the "art-nouveau" their earnest and helpful consideration when the exigencies of the case demanded it.

RAILWAY STATION AT KARLSPLATZ, VIENNA. OTTO WAGNER, ARCHITECT.

BRICKLAYING AND TRADE-UNIONISM.

SOME IMPORTANT FACTS.

A HIGHLY interesting and important series of articles on the crisis in British industry is now being published in the columns of the "Times." The first, which appeared in the issue for November 18th, dealt with the increasing adoption among bricklayers of the principle to "ca' canny" or "go easy"; and as the matter is of vital interest to architects and builders we take the liberty of reprinting the more important of the statements made. The "Times" says:—

A man may be employed and paid for ten hours, but there is a steadily-growing disposition to put into those ten hours only eight hours' real effort, while those engaged for eight hours will give only six hours of their energy, and so on. The whole system, as now being worked, is, in fact, the direct outcome of trade-unionism coupled with advanced socialism. In its mildest phase it takes the form of keeping the strong, efficient and willing worker down to the productive level of the weakest and most inefficient; and in its worst aspect it amounts to deliberate cheating—that is to say, a man accepts wages as the price of his whole capacity and energy, and gives only a half or two-thirds of them in return.

Number of Bricks Laid in a Day.

Though there is no rule as to the precise number of bricks a man shall lay in the course of his day's labour, there is a well-recognized unwritten law on the subject, which a bricklayer will disregard at his peril. Twenty years ago a bricklayer would lay his 1,000 bricks a day when on ordinary work. Thirty years ago the bricklayers employed on railway-tunnel work in London laid even 1,200 a day. But the unwritten law now in force declares that a bricklayer engaged even on ordinary work must "go easy" and not lay more than 400 in the day. He will thus "give another man a chance" by helping to render it necessary for more hands to be put on.

The maximum of 400 bricks per day is the "recognized" limit for dwelling-houses, shops and business premises built by a private contractor. In the case of public buildings, and especially London County Council and London School Board work, the limit is considerably less. It is to be feared that the London County Council must be held responsible in no small degree for the development of the "go easy" practices in the building trades generally. Thus, a firm of contractors had a job on hand in the East End of London, and complaint was made to some of the bricklayers—who could easily have laid from 600 to 700 bricks a day—that they were not doing enough. The reply they gave was: "The London County Council limit is 330 bricks the day. That is what they consider a fair day's work, and we are not going to do more for you or anyone else."

The Increase in Wages and its Effect.

Had there been any decrease of wages there might have been some excuse for the adoption of "go easy" principles. But the contrary is the fact. The wages have gone up substantially of late years, but instead of more work being done for the extra money there is less. The combined effect on the cost of labour has been such that, whereas a plain wall could have been put up ten years ago for from £12 to £14 per rod (272ft.), such a wall would now cost from £20 to £22 per rod. Allowance must, of course, be made for the increased cost of bricks, though 10 per cent. of this increase is due to the fact that the brickmakers adopt similar tactics to the bricklayers; but the average cost of labour alone in brickwork (exclusive of pointing) has increased from £3 to £6 per rod in the last ten years.

Not the Bricklayers Alone at Fault.

It is not against the bricklayers alone that complaints of "go easy" practices are brought. From the navvy who digs the foundations to the painter who puts on the last coat of varnish, all the men engaged in the building trades are declared to be "tarred with the same brush" in regard to doing less work for more money, especially where there is any lack of proper supervision. And, unfortunately, unless he makes up his mind to resort to exclusively non-union labour, the average master-builder is practically at the mercy of his men.

Foreign Joinery.

The ready-made doors from Sweden, sold here at 9s. 6d., would cost 13s. 6d. if made in England with the same wood and with similar machinery. A substantial trade has also sprung up of late years in Swedish window-sashes and frames, to the further detriment of our own carpentering trade; while architrave mouldings for doors and window frames are brought from Sweden and extensively sold here at one-third the cost of English mouldings.

In these directions the builder who is not engaged on really first-class work can obtain a certain set-off against English rates of labour, but his general position is that of being handicapped all round. Thus, he has not only direct troubles in dealing with his own men, but indirect worries owing to disputes and rivalries among the different unions.

There is, on the whole, more toleration of non-union labour in the building trades than was formerly the case; but in many instances the non-unionist is still subjected to systematic annoyance, and even to persecution, at the hands of the unionists when they can resort to such practices without danger to themselves. It is certain that a working man cannot be expected to fight out the matter with his union, and in some very shameful cases that have occurred the men have seen no alternative but to surrender to the despotic commands of the union officials.

Society Men and Non-Society Men.

Still another class of troubles is represented by an incident that occurred recently at Bath, where 100 masons and bricklayers left a job rather than work with five society men who had not paid certain penalties imposed on them, the strikers insisting that either the men should pay up or the firm should discharge them. The five would not pay, the firm would not discharge them, and so the 100 struck work and remained out until the local officials ordered them to return.

As the outcome of all these disputes, rivalries and squabbles among the men themselves a further augmentation in the cost of production takes place, and the eventual sufferers are the public, who either have to pay more for their houses or have them constructed in a jerry-built manner.

The Remedy.

An effective remedy for the present state of things in the building trade will not be easy to find. If the whole of the masters could show as much backbone as certain individuals among them do, and if they formed a solid and compact body, providing a common fund, there would be a better chance of overcoming trade-union tactics. On the other hand, it is feared that as long as municipal bodies like the London County Council remain what they are—their labour members returned by extremely active labour organizations getting the controlling voice on labour questions and playing into the hands of the trade-union workers—so long will it be practically impossible to place the trade on a satisfactory footing.

The foregoing statements of the "Times," so emphatic and so sweeping, are supported by Mr. Thomas Costigan, secretary of the London Master-Builders Association.

Mr. Costigan's Views.

In drawing attention to the various conditions of contract which are used by public bodies and by individual architects, he says:—Some of these conditions of contract contain clauses which operate very harshly on master-builders. So far as public bodies are concerned, their demands are in a large measure the result of political intrigue with trade-unions, but the same excuse cannot be advanced by architects as a justification. Architects know perfectly well the difficult middle position occupied by the master-builder, between the building employer on one hand and the workmen on the other. Modern trade-unionism is doing its best to strangle the building trade. As an example of the loss caused to a particular trade, we have the growing use of substitutes for plastering and the almost total extinction of the old artistic work in which our plasterers were formerly pre-eminent.

A Reply.

The assertions of the "Times," however, as might be expected, do not meet with universal approval. Thus, Mr. James G. Hutchinson says:—Just as any sort of stick is thought good enough with which to beat a dog, so any sort of argument is made to suffice with which to belabour the British workman. He has quite enough blame to bear which can be legitimately laid on his shoulders without being condemned for any remissness from which he may as often prove to be the victim as the aggressor. For instance, we are again being told that the unwritten law of the trade-unions will not permit a man to do more than a certain quantity of work per day. But whose fault is this? It looks as if the employer was not the master in his own workshop; it seems as if he was afraid to "sack" a man. I am further thoroughly convinced that the great body of workmen in the building trades would be more amenable to reason if there was less of the standoffishness shown by many employers. The workman's and the employer's interests are not identical, although they need not necessarily be antagonistic. It is the employer's interest to get as much work out of a man as he possibly can; while it is the workman's interest, or inclination, to give as little labour for his wages as will ensure his retaining his employment. I am conscious that this is a very low view to take of this phase of the question, though I am sorry to believe it is the true one. As an artisan and foreman of works, I am free to admit that trade-unions are a disturbing influence in the labour market; but at the same time I consider them essential as a protection from the otherwise untrammelled power of capitalism. Their greatest drawback, to my mind, is the hard-and-fast rule with reference to standard rates of wages—it being this rule which has the most to do with the restriction of the output so far as the superior men are affected.

Mr. William Woodward.

Mr. William Woodward, A.R.I.B.A., corroborates the "Times" to the full. He says:—Unless one is wilfully blind it is impossible to avoid the blatant display of non-work which meets one at every visit to a building. The foreman, to whom one formerly looked to see that a reasonable amount of work was being executed, is so terrorized by the hundred-and-one ways in which trade-unionism can make his life a misery, that he dare not put his foot down upon the swindling of labour which is going on. It may be said, What business is it of the architect to intervene in labour questions? The business is this, so far as I am personally concerned: I find buildings costing 25 per cent. more than they cost twenty-five years ago,

> "Not because of the shorter number of hours on the building, not because of any serious rise in the price of materials, not because the men are paid too much per hour, but solely because they are subject to the unwritten but well-understood law that their duty on the building is to carry out the doctrine of idleness and to do their level best to consume the greatest possible amount of time in producing the smallest possible amount of work."

(The foregoing is a quotation from my article on "The British Workman and his Competitors" in the "Nineteenth Century" for March last.) And it is not only cost, but delay in completion. I know all about the retort that we try to rush our buildings. Nothing of the sort; it is the 500 bricks instead of the 1,000; it is Mr. Plasterer playing a game of cards on the building during working hours; it is (a matter within my own knowledge) a threat to strike unless a drunken man is kept on the building; it is Mr. Plasterer, again, who will not allow a bricklayer to fix a tile 6in. by 6in., but will allow him to fix one 9in. by 9in.; it is the same gentleman who spoilt some stable-paving being done for me because he insisted that "granolithic" was plasterers' work, and not that of the bricklayers, who were doing the work properly; it is Mr. Bricklayer, this time, who has suddenly taken it into his head that roof-tiling is his work, and not

INTERIOR OF HOUSE AT VIENNA. T. M. OLBRICH, ARCHITECT.

that of the regular expert tiler who has hitherto made tile roofs the success they are; and so on with innumerable interferences in the work, all tending to inferior finish, all to delay, and all to absurdly enhanced cost.

At the L.C.C. Meeting.

At last week's meeting of the London County Council, on the reception of the Finance Committee's report, Captain Swinton asked the chairman if his attention had been called to the statement that the bricklayers of the Council laid 330 bricks per day, which was 70 less than the recognised number. Lord Welby, in reply, said there had been great activity in the building trade recently, and there had been a difficulty in obtaining that class of labour, and the bricklayers did not lay the number of bricks in a day which would be considered fair, but lately the manager reported that the number had been increased. He could not go beyond that at present. The attention of the Sub-Committee had been directed to the statement, and they would in the course of the week continue to investigate it and see how far the statement merited confirmation.

A Leeds Master-Builder's Experience.

A Leeds master-builder, confirming the statements made in the "Times," says:—Two years ago I had a contract of which about £70 was paid in labour. An exactly identical contract which I am now carrying out will cost me £15 more, on account of the men not doing the work they should do. The cost of labour is getting so great on account of the men's idleness that we cannot afford to go on building because people will not buy at the price.

The Position in Yorkshire.

The "Yorkshire Daily Post" says:—The unfair practices denounced by the "Times" are in no sense new to North-country builders. They existed several years ago, but it was not until the lock-out of 1899 in Yorkshire that public attention was called to them. Among the specific complaints were the following: 1. (*a*) Compelling foremen, who represented the employer, to join the operatives' union, thus becoming their servant rather than the employer's. (*b*) Refusal to work until the foremen joined the operatives' union. 2. Refusal to work along with non-union men, and coercing non-union men to join their unions. 3. (*a*) Dictating to the employer which workmen shall do certain work, and not allowing the employer any voice or choice in the matter. (*b*) The practice of withdrawing all their men when such work is going to another trade. (*c*) Refusal to fix material worked or partially worked in any other district. Against these alleged tyrannies the Yorkshire master-builders fought hard and long, but they were not backed up by the southern and western members of the National Federation of Building Employers, and the result of the struggle was not much in their favour. Trade jealousies and rivalries are greater in the building trade than in other important industries, and the operatives, it is said, take advantage of it.

The Opinion of the Free Labour Association.

Mr. W. Collison, general secretary of the National Free Labour Association, notes with pleasure the exposure of the gross waste of time advocated by socialistic trade-union leaders and practised by their dupes—the trade-union workmen. He appends a resolution discussed at the ninth annual free labour congress, held in London in October last, urging non-union workmen to avoid losing time and to apply their best energies and skill in doing a fair day's work for a fair day's pay.

"Manchester" says: "I think the masters have the remedy in their own hands. They must absolutely refuse to employ trade-union foremen."

The Bricklayers' Point of View.

The bricklayers' view of the matter is given by "A Bricklayer's Labourer" who says in a letter to the "Times":—Your correspondent does not know the truth with regard to the bricklayer, his union, or his principles, as I will show. The union rate of wages varies from 6d. to 10d. per hour, varying with the district in which he is working. If he is working in a high-rated district—for instance, London or Newcastle—he receives 10d. per hour, or, for a nine-hours' day, 7s. 6d. Now, we all know of the old adage that the wrong is not so much in committing the offence as in getting found out. Sometimes the master-builder beguiles poor bricky with oily tongue and the price of drink at dinner-time because it is a hot or a cold day. One or two more bits of finesse and poor bricky has broken his union rules; he and his pals have made a clandestine contract to do so many hundred yards of brickwork at 2s. 6d. per yard. Then it is that the master-builder not only gets his work done cheaper and quicker, each bricklayer will build 4yds. of brickwork per day, for which, of course, he receives 10s., and as there are eighty-two bricks per sq. yd. he has only laid 336 bricks, only six more bricks than the County Council bricklayers. If your correspondent has any worthy men who can do a turn at that simple and fundamental matter of bricklaying, if they can lay 1,000 or 1,200 bricks per day, here in Newcastle is their America. The master-builders are paying nearly 3s. per hundred for laying them now; that would bring the worthy men in 30s. or more per day, nearly enough for a man who can write an article on fizzle. But the watch-dogs of commerce want something besides scraps for their barking (I should if I were watch-dog). Hundreds of flats are built in Newcastle and Tyneside every year. The finance companies advance 80 per cent. of their assessed value, which is £400; the builder pays all wages, material, and gets his own profit out of it. The finance companies then take them over and sell them for £625 to £680, or in a transaction which only lasts a few minutes make two-thirds as much profit as the whole cost of labour and material. I will spare your correspondent any more. I wonder what will be his next indictment to the British workman; he is very much what his masters have made him.

The Engineering Trades.

The engineering trades are dealt with in the second of the series of articles in the "Times." It is stated that the position in the engineering trades has greatly improved since the dispute of four years ago, the effects of the famous agreement then arrived at having been most beneficial to the employers, while they have also conferred advantages on the employed, though the conditions laid down by the agreement were at the time regarded as the harsh terms of a remorseless conqueror. Since then the men's society has prospered more than it ever did before, and the men individually have been getting better returns. Yet truth compels the statement that, while the leaders of the men employed in the engineering trades are beginning to see more clearly how the interests of the employed are bound up with those of the employers, and to understand the real nature of the conditions which the latter have to face, these newer ideas and this broader knowledge have not yet permeated the general mass of the men.

PROFESSOR CHURCH ON SMOKE.

AT a meeting of the Coal-Smoke Abatement Society held on Wednesday last Prof. A. H. Church, of the Royal Academy, in seconding a resolution by Sir W. Broadbent, testified to the damage to works of art wrought by coal-smoke. Smoke in its condensed form of soot was something more and something worse than carbon. It was carbon closely associated with tarry matters, moisture, sulphuretted hydrogen, sulphuric acid and ammonia salts. While the carbon tended to dirty and darken everything on which it fell, the tarry matters caused the soot to adhere, so that the moisture, the salts, and the acids injured and corroded the surfaces on which the soot was deposited. The absorptive power of carbon was known to be very great and varied, and it was to this power that must be ascribed a great part of the harm done to works of art by coal-smoke. A varnished oil-painting must in London be protected by a glass. When a few years ago he superintended the cleaning of Mr. Watts's great fresco in Lincoln's Inn Hall, he found that it was the tarry and corrosive soot that had drawn the veil of night over the entire picture. The action of smoke on metals was equally injurious, and architectural art suffered in the same way. He produced a piece of dirt from the underside of the moulding which encircled the stone gallery just below the dome of St. Paul's. This deposit, 2in. or 3in. deep, owed its blackness to 1 per cent. of carbon or soot. The bulk of the deposit was sulphate of lime, which owed its presence to the corrosive action on the stone of the sulphuric acid in the London air.

Builders' Notes.

Mr. H. Burchell, who was for many years a monumental mason at Hastings, died recently at his residence at Twickenham.

Bricklayers Rewarded for a Find.—A Hastings bricklayer named Poole and a bricklayer named Bouton, who found a hoard of sovereigns whilst working at an old house in George Street, have been awarded by the Treasury—the former £94 and the latter £106.

Seizure of Cement from Belgium.—An important seizure of a large quantity of Belgium cement has been made at Deganwy by H.M. principal officer of Customs. The "Lord Devon," from Antwerp, arrived at Deganwy with a cargo of cement consigned to Mr. Joseph Parr, builders' merchant, carrying on business at Bootle, Ramsey and Deganwy. On part of the cargo being discharged the remainder was found to be packed in bags branded on one side with the name and style of Mr. Parr, and on the other with the legend "Portland cement." The officer of Customs suspected something wrong, and has detained the cargo under the Merchandise Marks Act, and before releasing it he will insist upon every bag being being marked "Made in Belgium.

London County Council.—At last week's meeting a number of tradesmen's petitions against the suggested new by-laws with regard to the height of shop-blinds, lamps, &c., were presented; they were referred to the Building Act Committee.—The question of how many bricks were laid per day by the Council's bricklayers was discussed (see this page).—The Historical Records and Buildings Committee reported that additions to the Council's library had been received from Dundee, Copenhagen, Victoria, Moscow, New York, the Institution of Civil Engineers, the Society of Arts, the Lewisham Union, the School Board for London, and the Royal Institute of British Architects.—Mr. Davies stated that the Chief Commissioner of Works had given his consent for the Council to proceed with the widening of Piccadilly. At the next meeting authority would be asked for carrying out the scheme without delay.—Up to the present no name had been fixed on for the new street from Holborn to the Strand.—The Improvements Committee submitted an estimate of £3,500 for the construction of vaults extending 12ft. underneath the footways of the north side of the Strand, in connection with the Holborn and Strand Improvement. They deferred any similar recommendation with regard to the new street and crescent road. The report was adopted.—The adjourned report of the same committee was submitted dealing with the sale of two pieces of land—one in Southwark and the other in Hackney—for housing purposes. In the first case the valuer fixed the value of the land at £2,875, and in the second case at £1,250; but the Housing Committee asked that, in order that they might carry out housing schemes in accordance with the statutory obligations, the Southwark land should be sold to them for £1,432 and the Hackney land transferred to them for nothing. This was agreed to after discussion.—The Establishment Committee reported that additional office accommodation for the Council's staff was urgently required, more particularly for the housing of the working classes branch of the architect's department. They proposed to lease a new building in Charing Cross Road, containing eighty-nine available rooms, at an annual rental of £2,800, and to expend £1,600 on alterations, furniture and fittings. This recommendation led up to a general conversation as to the necessity for a new municipal hall and offices, and some hopes were expressed that the Special Sites Committee would report shortly. The proposal of the Establishment Committee was adopted.

TIDES AND SEWAGE.

Observations by Mr. Kaye Parry and Dr. Adeney.

AT a meeting of the Institution of Civil Engineers held on November 12th a paper was read on "The Discharge of Sewage into a Tidal Estuary" by W. Kaye Parry, M.A., B.A.I., M.I.C.E., and W. E. Adeney, D.Sc.

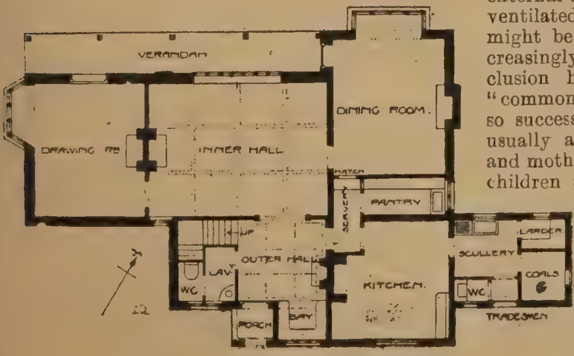
It was stated that the river Liffey, together with the tidal estuary, to which this paper referred, received the sewage discharged not only from the city of Dublin but from all the neighbouring suburban townships. The investigations described were intended particularly to ascertain the effect of the discharge of the sewage of two townships—Rathmines and Pembroke—into the tidal estuary.

The sewage was discharged from a tank sewer during the first five hours of each ebb-tide about a mile above the ends of the training-walls which enclosed Dublin Harbour; and it was found that at high-water of average tides the extent of the pollution of the river-water above the outfall was very slight indeed. This was obviously accounted for by the large volume of pure sea-water present in the harbour at high tide. Corresponding examinations of the surface-water at low spring tides showed that under these conditions the surface-water was distinctly more polluted. But the bottom samples collected at the same places and at the same times still remained comparatively pure.

For the purpose of ascertaining the relative proportions of sea- and river-water in the several samples collected, the total solids contained in each sample had been estimated. It was proved that at low water of spring tides the bottom waters of the deep-water channel from the Pigeon House Fort downwards consisted of a mixture of 5 or 6 parts of sea-water to 1 part of river-water, whereas the surface samples taken at the same time consisted of from 1 part of sea-water and 3 parts of river-water at the Pigeon House Fort to 2·1 parts of sea-water and 1 part river-water 1,870yds. lower down.

A number of analytical tables were given in the paper, and these went to show that the loss of dissolved oxygen even in the surface samples in the deep-water channel in no case exceeded 23 per cent. It was pointed out that although the sewage of about fifty or sixty thousand persons had been delivered untreated into this deep-water channel for eighteen years, no permanent deposits of any kind existed either near or below the outfall. In order to ascertain the relative volumes of sewage and clean water in the tidal estuary the discharges from the Rathmines and Pembroke outfall were observed and computed both at spring and at neap tides. The liquid which was then discharged consisted of sewage from which the heavier solids had been previously removed, together with considerable volumes of subsoil-water. The quantity of dry solids removed from the sewage might be taken as about 1⅓ ton per day.

It was stated that although the great dilution contributed materially towards disposing of the sewage by dispersing the organic matter, the resolution of this matter into harmless inorganic substances and gases by bacterial fermentation and other agencies did not take place to any large extent in the estuary itself, but was slowly effected after the liquid reached open water.



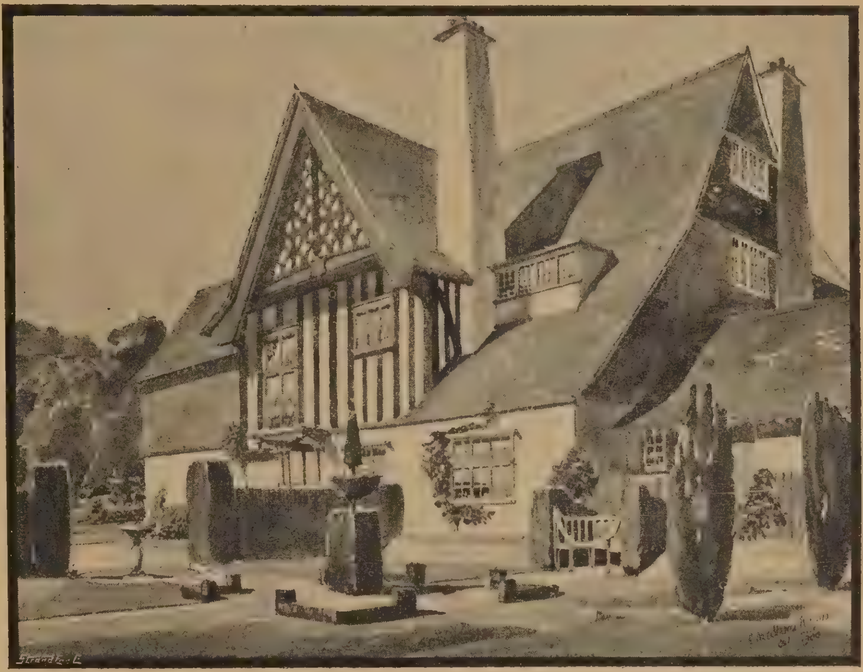
PLAN OF HOUSE AT REIGATE.

Views & Reviews.

Healthy Houses.

Dr. Sykes, the medical officer of health for St. Pancras, is such an acknowledged authority on public health that his opinions on the relation of this subject to the housing problem are sure to be of interest and value. So much has already been said and written about housing, that it is difficult to find any new matter, yet in this book many valuable statistics and tables are given, and the various types of houses are described and criticised in a wise and helpful manner. The evils of overcrowding are too familiar to need emphasis, and we can pass over this section of the book. More interesting reading is furnished by the chapters on back-to-back houses, tenements and flats, their respective evils and defects. Statistics show that the death-rate increases with the increase in back-to-back houses, and that as the width of the street diminishes the increase in the mortality becomes more and more marked; in fact, the healthiness of a dwelling in this country increases in proportion to the amount of daylight and sunlight admitted] to it. Dr. Sykes very properly insists that open spaces immediately contiguous to dwelling-houses should not be allowed to become merely barren wastes (like those facing Euston Road in his own borough), but should either be regularly cultivated or permanently paved, "instead of leaving it to vague by-laws that are difficult, if not impossible, to interpret." With regard to internal common staircases in compound dwellings, these are found to be unhealthy. They should always be external or against an outer wall, and be amply ventilated at each floor-level; and the same might be said of those "wells" which are increasingly found in flats. An interesting conclusion has been arrived at with regard to "common" washhouses. They have not proved so successful as anticipated, because they are usually at some distance from the dwellings, and mothers are disinclined to leave their young children and spend a large part of the day in the washhouse. "Associated" washhouses, or those of a single type allotted on particular days to each family, are found to be more satisfactory. Dr. Sykes, we are glad to note, has a good word to say for the London County Council and its workmen's dwellings. Among many other matters dealt with, it is pointed out that though a newly-elected or rebuilt house in the Metropolis cannot be occupied as a dwelling-house until the sanitary authority certifies that there is a proper water-supply, no similar certificate is required as to the drainage—an omission for which there is no valid reason. The book is printed on a hard light paper, and the type is large and very easy to read: altogether the "get-up" is excellent.

"Public Health and Housing." By John F. J. Sykes, M.D. London: P. S. King & Son, Orchard House, Westminster. Price 5s. nett.



HOUSE AT REIGATE. T. PHILLIPS FIGGIS, ARCHITECT.

Building Construction.

As a cheap elementary text-book for the first stage of the South Kensington examinations this book accurately fulfils its purpose. The author has wisely "not hesitated, in certain cases, to introduce a simple explanation of the theoretical considerations which govern the methods adopted in practice." He might with advantage have introduced more. At the end of each chapter questions are given, which may be of advantage in class-work. The illustrations are badly drawn, lettered crudely and often printed out of the square. In fact the get-up of the book is unprepossessing, though the information it supplies is clearly set forth.

"First Stage Building Construction," by Brysson Cunningham, B.E., A.M.I.C.E. London: W. B. Clive, University Tutorial Press, 157, Drury Lane W.C. Price 2s.

Associated Portland Cement Manufacturers (1900), Ltd.—The directors regret that their first year's trading should not allow a dividend on the Ordinary shares. This disappointing result is stated to be mainly due to the greatly increased cost of materials, more especially the high prices paid for fuel. No item of depreciation appears in the accounts.

House at Reigate.—This house, by Mr. T. Phillips Figgis, has recently been erected in the Croydon Road, Reigate. The leading feature in the plan is a large inner hall, suitable for receptions, &c. In addition to the accommodation shown on the ground floor, five bedrooms, a bath-room, &c., and linen-room are provided on the first floor, and two bedrooms, box and cistern-room on the second floor. The exterior is "rough-cast," with tile hanging and tile roofs, with the exception of the front gable, which is of half-timber work. The inner hall is panelled in pine, and ornamental lead-glazing has been provided throughout. The builders were Messrs. Nightingale & Sons, of Reigate.

Keystones.

A New London Board School has been erected in Cobbold Road Shepherd's Bush, at a cost of £20,000, and provides accommodation for about 900 children

A Bust of Samuel Richardson, presented by Mr. Passmore Edwards, and executed by Mr. Frampton, A.R.A., has been placed in St. Bride's Institute. The bust occupies a well-designed niche.

The Royal Apartments at Epsom Grand Stand are being extensively altered, and a new electric passenger lift, made by Messrs. Archibald Smith & Stevens, Queen's Road, Battersea, S.W., is being erected.

An Old Fable Modernized.—"Send portfolios to my parlour," says the Liverpool Cathedral spider. But the architectural fly, from bitter experience, knows what that "prettiest little parlour" means; so he fights shy of it and flies!

A New Church of All Saints at Petersham is now being erected by Mr. G. W. Heasler, of Richmond, from designs by Mr. John Kelly, architect. It will accommodate about 600 persons. The plan comprises a nave with north and south aisles, 70ft. long by 48ft. 6in. wide. The clerk of the works is Mr. Hayhoe, of Richmond.

New District Council Offices for Hendon have been erected, at a cost of £11,300, on the high road at Burroughs. Accommodation is provided for clerk, engineer, medical officer, sanitary officers, rate-collector, and the Hendon School Board. It was designed by Mr. T. H. Watson, architect, and has been erected by Mr. T. H. Kingerlee.

New Board School for Woodford, Essex.—At the last meeting of the Woodford School Board the plans by Mr. E. Tidman, C.E., architect, for a block of new schools to be erected in Snakes Lane for the Woodford Bridge and Ray Lodge districts, were adopted. The proposed schools will be a two-storey building, and will provide at first for 700 children (300 infants, 200 girls and 200 boys), with a provision for an extension to the total of 1,000 when complete. Mr. Tidman was instructed to submit the plans for approval to the Board of Education without delay.

"Formal Gardens in England and Scotland: their Planning and Arrangement, Architectural and Ornamental Features," is the title of a new book by Mr. H. Inigo Triggs, A.R.I.B.A., which will be published by Mr. B. T. Batsford shortly. It will consist of a series of illustrations mainly from old examples, with an introduction and descriptive accounts, comprising 120 plates 17in. by 13in., 70 of which will be from measured drawings and sketches by the author and 50 form photographs by Mr. Charles Latham. The work will be issued to subscribers in three parts, each 21s. nett. The illustrated prospectus promises a work of exceptional value and interest.

A New Church at Great Lever, Bolton, to be dedicated to SS. Simon and Jude, is being erected. The site is situated at the junction of Forester Street and Rishton Lane, and the west front of the church faces Rishton Lane. The tower at the south-west angle forms a conspicuous landmark. The church is arranged with a lofty nave, with pillars and arcading of Bath stone, also side aisles, large chancel transepts and side chapel, vestries and organ-chamber. The chancel is well raised, and arranged to allow of the congregation seeing and hearing the whole of the service, the accommodation provided being for between 600 and 700 persons. The style is Late Decorated Gothic. The church school, which has been completed and occupied for some time, is placed behind the church, fronting Forester Street. It is a two-storey building, on the centre-hall system, with classrooms at each side, and accommodates about 450, but is arranged for future extension to about 650. The materials throughout are red bricks and red Ruabon terra-cotta, the roof being covered with North-country green slates, and the joiners' work throughout being of pitch-pine. The whole of the works have been carried out from the designs and under the superintendence of Mr. R. Knill-Freeman, F.R.I.B.A., of Bolton and Manchester; Messrs. William Townson & Sons, of Bolton, were the general contractors.

New Municipal Buildings at Reigate have been opened.

Building Construction.—The serial article on this subject is held over till next week.

A New Miners' Club at Backworth has been erected.

The Age of Stonehenge.—Sir Norman Lockyer and Mr. F. C. Penrose calculate 1680 B.C. as the date of Stonehenge, from its orientation.

Change of Address.—Messrs. Heron & Bellairs, architects and surveyors, have removed from 27, Fitzroy Street, Fitzroy Square, W., to 27, Sackville Street, Piccadilly, W.

Mr. Alfred Waterhouse, R.A., who sustained a somewhat severe attack of paralysis in the summer at his Berkshire residence, maintains the improvement which recently took place and is deriving benefit from occasional drives.

The Parish Church of Weare, Somerset, which has been closed for alterations and repairs for eight months, has just been reopened. The restoration has been carried out under the direction of Mr. Edmund Sedding.

The New St. George's Parish Institute, Portsea, was opened recently. It is built of red bricks, with stone facings, and the hall will accommodate about 500 persons. Mr. G. C. Vernon-Inkpen is the architect, and the work has been carried out by Mr. A. W. Bevis, of High Street, Portsmouth.

Mr. Thomas Hardy (who, it will be remembered, began life in an architect's office) in his recently published "Poems of the Past and Present" gives a characteristic poem telling of a man who lavished his substance in building a church and making it entirely beautiful. He became poor, his heirs reviled him, and in the end he went and hanged himself in the church.

Finds in Pompeii.—Another house at Pompeii, the dwelling of M. Lucretius Fronto, unknown to history but evidently a wealthy man, has been unearthed. His name is recorded on a marble slab found *in situ*, where he is said to have been a strong and worthy man. The building is in good preservation. It is highly decorated, and the mural paintings in the triclinium are remarkable for their excellence of design and freshness of colour. Three of them are considered to be masterpieces. One represents Bacchus, Silenus and Ariadne. The other portrays Venus Aphrodite. The third, and perhaps the best, painting, evidently due to a Grecian artist, represents Perona offering her breasts to her old father Micon, condemned to die of starvation.

Edinburgh Architectural Association.—The associate members held an opening club night in their new room 117, George Street, on November 15th. Mr. A. Horne Campbell occupied the chair. There was a gathering of between eighty and ninety members and friends. A musical programme was provided. The first ordinary meeting of the associates section was held last Wednesday, Mr. J. Stuart Syme in the chair. Mr. W. S. A. Gordon delivered a lecture on some of the cathedrals of England. Special reference was made to Canterbury Cathedral, the history of which Mr. Gordon traced from the landing of St. Augustine in England up to the present time. Brief sketches were also given of the cathedrals of York and Beverley and Wells.

Stockport Town Hall Competition.—At a meeting of the Stockport Municipal Buildings Committee the application of architects for permission to compete in the designs for municipal buildings were opened. There were no less than sixty-seven applications. The number was at length reduced to fifteen, and a sub-committee was appointed to draw up the conditions and also to make inquiries into the qualifications of the different competitors. The fifteen competitors who are now under consideration are: Briggs & Wolstenholme, Blackburn and Liverpool; Derbyshire & Smith, Manchester; Alfred W. Cross, London; James G. Gibson, London; Henry T. Hare, London; William Hill & Sons, Leeds; Holton & Fox, Dewsbury; S. R. J. Smith, London; S. B. Russell & C. E. Mallows, London; Geoffrey Brady, Stockport; Arthur G. Wilkinson, Stockport; C. R. Locke, Stockport; Stott & Son, Manchester; A. Bramwell Thomas, London; Woodhouse & Willoughby, Manchester.

Kew Cowl Tests—In the ninth line of the second column on page 240 of our last issue "appropriate" is printed instead of "inappropriate."

The Manchester Fire Station Competition.—The whole of the designs submitted in this competition will be on view at the Manchester Town Hall to-day, to-morrow and Friday, from 10 a.m. to 3 p.m. Twenty-eight sets were submitted.

The Annual Dinner of The Manchester Society of Architects was held on Thursday last. Mr. Alfred Darbyshire (the president) occupied the chair, and among those present were the Lord Mayor of Manchester (Alderman Hoy), Mr. William Emerson, P.R.I.B.A., Mr. Edward Salomons, and Mr. Alfred Hopkinson (Principal of Owens College). Mr. Salomons advocated the appointment of a city architect, but the Lord Mayor considered it was much better for the buildings of Manchester to be the result of open competition.

The Society of Designers held a meeting on November 19th, Mr. F. Hamilton Jackson, R.B.A., in the chair. Mr. George C. Haité lectured on "Pattern Design and Designers of the Nineteenth Century." He classified the designers into three groups: the early pattern designers in dress material whose work culminated in the forties or fifties; the architectural school, led by Pugin. Burges, Godwin, Owen Jones and others which culminated in the seventies; and last, the purely decorative design of to-day. The old pattern designers were nearly all descended from Huguenot stock and lived mostly in the villages on the river Wandle, the water of which had peculiar properties most suitable for washing out dyes, and where the mills were chiefly situated. Mr. Haité in particular objected to the intervention of the middleman, who dictated to the manufacturers and designers upon questions of design, assuming to know the taste of the public, which no man did. Mr. F. Hamilton Jackson referred to the difficulty of selling good designs for wall-papers, for the design which looked best in a book did not look best on a wall; large screens on which they should only be shown were cumbersome, and both agent and middleman always sold from the book.

Engineering Notes.

Mr. W. A. Paley has been appointed to succeed the late Mr. Palfreyman as engineer at the House of Commons.

H.M. Revenue Offices, Liverpool, have lately been warmed by Messrs. John King, Ltd., engineers, Liverpool, by their improved "Rahnee" radiators fitted with patent "Rex" radiator valves.

The Rhyl Electric Light and Destructor Works were opened recently. The works are the largest in North Wales, and cost £30,000, including provision for electrical traction. Sixteen miles of cable have been laid.

Newcastle City Engineer.—The Newcastle City Council have appointed Mr. Frederick James Edge, assistant city engineer of Liverpool, to be city engineer of Newcastle at a yearly salary of £1,000.

Electric Lighting Boards (British Manufacturing Co.), Ltd., have transferred their sales department to 9, Grosvenor Mansions, Victoria Street, Westminster, which will serve as the head depot and to which address all enquiries as to goods should be made. The company's counting-house has also been transferred to this address on November 1st.

The British Institute of Certificated Carpenters visited the new Vauxhall Bridge works on Saturday, and were shown a recently constructed large model of the principal span of the new structure made of Portland concrete and faced with granite. The bridge will be constructed entirely of the same material, and, as explained by the resident engineer, Mr. D. Wells, will not, like some of the other London bridges, require annual or constant repairing, but will be stronger in forty years than when first built. It is expected that the work will be completed in a little over five years' time. There will be two lines for electric trams across the bridge.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Payment for Quantities by Contractor.

Cardiff.—H. W. H. writes: "A builder tendered for certain works according to a bill of quantities supplied by the architect, and included the usual 2½ per cent., for quantities, on the amount of the contract. Owing to the tenders exceeding the amount which was intended to be expended, the two builders whose tenders were lowest were asked to re-tender for the work after certain modifications had been made, the said builder being one of the two. In preparing his amended tender, the latter based the 2½ per cent. upon the ultimate amount of the reduced price. His tender was accepted, and the architect now claims the 2½ per cent. on the amount of the first tender, which is, of course, more than was taken for tender No. 2. Can he legally claim this?"

You will have to pay on the amount of the first tender, as the quantity surveyor must be paid for his work, and you have agreed to do so. This is of common occurrence, and you must pay for the experience. We must say, however, that the system is a pernicious one, and unfair to both the quantity surveyor and the contractor.

Cause of Putty Flaking.

Mansfield.—Builder writes: "I built a greenhouse last year, which was glazed in December, and the putty peeled off in flakes this summer. What was the reason?"

We presume the wood was wet or damp when the putty was put on; consequently, it never took a hold, and when it dried it naturally flaked off.

Ascertaining the Distance of an Invisible Object.

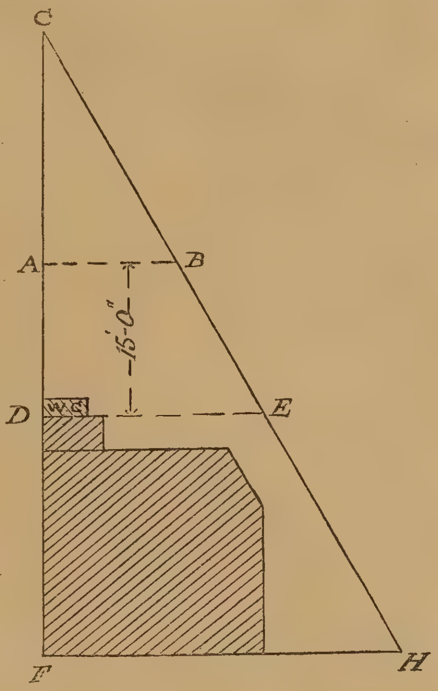
Student writes: "Kindly state in simple language the formula for finding the distance of an invisible object, a base and angles being known. What is the shortest base (consistent with accuracy) that can be taken for distances up to 1,000yds?"

To find the distance of an inaccessible object by calculation requires the use of trigonometry, but it may be found approximately by plotting the base line and angles to any convenient scale. A base of 100yds. should be used for ascertaining the distance of about 1,000yds., unless very accurate instruments are used, when half that base might be sufficient. HENRY ADAMS.

Air-Space around Buildings.

Aberdare.—Cynon writes: "The reply to my enquiry relative to air-space around buildings, on p. 181 of your issue for October 23rd, does not give the desired information. You have evidently taken the boundary wall 18in. thick for a road or passage. The distance from A to C is 15ft., but the surveyor in arriving at his decision squared the building to a point marked B, and said the 15ft. should be measured from this imaginary point, although the by-law says 'from every point of such building,' and further that the 15ft. should be measured to the boundary wall and not over. The boundary wall is entirely on our own property. Now the point is this, has he a right to say we have not caused the 'open space to extend laterally throughout the entire width of such building,' and that the distance across the open space from every part of the building to the boundary of any lands or property immediately opposite or adjoining the site of such building is not 15ft.? He says the annotated by-laws give examples?"

1. The surveyor is quite correct in his interpretation of clause 58 of the local by-laws (which is apparently precisely the same as clause 54 of the Model By-laws) as regards the ordinary method of calculating the air-space, &c., under this particular clause. Taking into consideration the additional information now given, it should, however, be pointed out to the surveyor that if he again refers to the annotated by-laws he will find that the examples he quotes deal with rectangular sites only, or building plots having a width at the rear equal to that of the frontage. In the case of building sites tapering to the rear, it should be borne in mind that the absolute and literal requirements of such a clause as that mentioned, namely, that the "open space shall extend laterally throughout the entire width of such building"—and for the specified distance across—cannot always be complied with. In order to deal with cases of this description, a modification of this Model By-law is therefore provided in clause 54A of the annotated by-laws as follows: "Provided always that in any case where the site of a building may be of such a shape that the width thereof diminishes towards the rear, and it is therefore impossible to provide an open space extending laterally throughout the entire width of such building and having the required distance across such space, the person who shall erect such building shall provide in the rear thereof an open space, the extent of which is to be determined in accordance with the provisions of this by-law, subject to the following exceptions: (1) He shall cause that the distance across such space measured from the rearmost wall of such building to a line at which the lateral width of the open space shall not be less than one-half of the width of such space at such rearmost wall. (2) He shall provide on the side of such line remote from the building a further open space, exclusively belonging to such building, of a superficial area equal to one-third of the area of the space hereinbefore required to be provided. (3) This proviso shall not apply in the case of any building which would form part of a continuous line of buildings enclosing a space in the rear of such buildings whether in the form of a square or in any other form." The accompanying diagram shows the application of this modification of the ordinary by-law to the particular case in question. Under these conditions the length of the line A B (at a distance of 15ft. from the rearmost wall of the proposed building) must be not less than one-half the length of the line D E (which is the prolonged line of the rearmost wall of the building), whilst the area of the open space A B C must be not less than one-third of the open space enclosed within the figure A B E D. At the same time the building may occupy the whole of the area enclosed within the figure D, E, H, F. It is suggested that a revised plan complying with these conditions be submitted to the local authority, and asking that it may be dealt with in the manner described above for building sites of this description. Should the approval of the local authority be withheld, the whole matter might then be placed before the Local Government Board.—2. It is considered that the surveyor is quite justified in declining to include the boundary wall within the measurements of the "open space," &c., required at the rear of the building under this by-law, seeing that the by-law lays down that the "open space" shall be "free from any erection thereon above the level of the ground, except a water-closet, earth-closet or privy, and an ash-pit." Otherwise it might be possible for the whole of the "open space" to be occupied by a boundary wall 10ft. or 15ft. thick, and so rendering this portion of the clause partially or wholly inoperative. T. E. C.



Retaining Heat in Cistern.

Croydon.—E. B. writes: "Which is the best possible method of keeping hot a 300-gallon water cistern for, say, six or seven hours? Some clients of mine who have a great amount of machinery in use for various purposes between 9 and 11 a.m. are obliged to keep a 10 h.p. boiler alight all day in order to afford a means of obtaining hot water to wash up the utensils of a large business in the afternoon. It has been suggested that if any packing could be so arranged around the cistern the water might be boiled in the morning and the fires then allowed to go out."

If this cistern is covered with two thicknesses of ½in. hair-felt it will retain its heat for some hours. If it has a wood-cover, one thickness of felt might be put over the cover. The felt may be kept in place round the cistern by hoop-iron bands, and may be prevented from damage by canvas sewn round outside (see the particulars of tests with slag wool given on p. 272 of this issue). HENRY ADAMS.

Hip to Queen-Post Roof.

Student writes: "Which is the proper way to form a hip at the end of a Queen-post roof?"

The Queen-post truss will presumably have a flat top, and in that case the hipped end will be formed by two partial trusses consisting of principal rafters and tie-beam connected to the nearest whole truss by wrought-iron plates and bolts, and will carry purlins and common rafters as in the remainder of the roof.

HENRY ADAMS.

Action of Sea-Water and Cements on Iron.

London, S.E.—R. N. writes: "I have read that the action of sea-water on cast iron, as in the case of piles, &c., is to convert it into a soft substance which can be cut with a knife. What is the chemical action which causes that condition? Do iron columns embedded in brickwork and cement undergo much deterioration in substance from chemical action? It is suggested that in the course of time a basic silicate may be set up between the cement and iron. Is that so?"

The chemical action of sea-water on iron has not been fully investigated, but it would appear to be similar to ordinary rusting, that is, the carbon dioxide (carbonic acid gas) in the water starting the action, hydrated ferric oxide is formed slowly at first, together with a small proportion of carbonate of iron. After the action has been started it proceeds more rapidly, probably because the iron and hydrated iron oxide exert an electrolytic action on the water. The presence of water and carbon dioxide are necessary to rusting, dry pure air not affecting iron. The emission of hydrogen gas caused by this action disintegrates the close crystalline form of the metal, and the bulk is also increased, causing the flaky condition of iron rust. The deposition of the calcium and magnesium compounds in sea-water with vegetable growths of a slimy nature often make the rust able to be cut with a knife, but when alternately exposed to air and water and allowed to dry the coating becomes extremely hard. The crystalline condition of the iron appears also to have a most important effect upon the rusting. The constituents of a good Portland cement form stable compounds when set, which show no tendency to unite with the iron. In fact, cement is a protection, by keeping moist air away from it. See an answer to an enquiry on p. 521 of our issue for August 7th last.

New Patents.

These patents are open to opposition until December 30th.

1900.—Water and Steam Distribution.—19,318. A. Godfray, Bailiff's Cross, St. Andrew's Parish, Guernsey. Above the boiler is fixed a closed tank which is automatically filled from a cold-water supply tank. This closed tank is connected by pipes with the steam space in the boiler, and there are also pipes to automatically supply hot water up to a certain level in the boiler. By these means the steam circulates through one range of pipes and the hot water through another, so that both are always available for heating or other purposes.

Baths.—20,323. J. Nuttall, 27, Langton Street, and R. Wilson, 19, Gorsey Hill Street; both of Heywood, Lancs. This invention relates to a rising and falling bath intended for use in cottage property, workmen's dwellings, or elsewhere where accommodation is limited. Normally, it lies within a bricked well below the floor, the opening being covered by sliding or hinged doors. From this well the bath can be raised by gearing, suitable arrangements being provided for the supply and discharge of water.

Waste-Valve for Lavatories, Sinks, &c.—20,459. R. G. Howson, Hanley, Staffs. The object of this invention is to avoid a tortuous overflow-passage in the body of the basin. The valve, when closed, allows an overflow through it for maintaining a constant or maximum level, and, when opened, cuts off the air-supply from the valve enclosure, so inducing syphonage and the discharge of the water through the normal outlet.

Drying Bricks, Timber, &c.—21,226. A. E. Brown, 5, Kent Terrace, Regent's Park, N.W. The bricks, tiles, timber, &c., are dried in a tunnel on the direct system of ventilation, in which the air is admitted at a comparatively low temperature at the cooler end of the tunnel, at which end also the wet goods are introduced. The progressive warming of the air is chiefly effected by contact with the cars and goods, which themselves receive heat from radiators above and below them. The essential principle of the invention is that the supply of heat within the tunnel is by radiation and not by convection.

Rainwater-Pipe Wall-Sockets.—23,004. J. Smith, 4, Hampden Street, and R. Walker, 33, Brinkburn Terrace, Stanhope Road; both of South Shields. The socket is made entirely separate from the pipe, so that the latter can be easily renewed; and, moreover, painting is facilitated, as the pipe is not held fast against the wall. The top part of the socket is recessed to receive the end of the upper pipe, and the bottom part is made with an outer and inner sleeve between which the end of the lower pipe is inserted.

1901.—Slag Wool.—16,588. G. A. Herdman, Redcar Iron Works, Redcar. The slag wool is treated with sufficient silicate of soda to give the particles the requisite coherence and is then moulded, the moulds being lined with muslin or scrim, which adheres to the wool and allows it to be freely handled or cut up without fear of disintegration.

The following specifications were published on Saturday last, and are open to opposition until January 6th, 1902. *The name in italics is that of the communicators of the invention. A summary of the more important of them will be given next week.*

1900.—15,426, Gardner, valves for taps. 19,597, Bushman, composition for use as a plaster or artificial stone. 19,758, Webb & Webb, inlaid wood tiles, blocks, &c. 19,980, Bennis & Bennis, refuse-destructors. 20,709, Fletcher, door and window holders. 22,037, Hickinbotham, water-taps. 22,041, Fullerton, metallic pipe-connections for sinks, water-closets, &c. 22,620, Watt, securing doors in different positions. 22,850, Lazerme, valves. 22,909, Pickles, actuating the saw frame in reciprocating wood-sawing machines. 23,212, Corbin, stair treads. 23,745, Mitchell, low-pressure valves.

1901.—25, Adams, filter beds. 385, Pullan & Mann, brick presses. 1,187, Eadie & Tannahill, pipe joints. 3,101, Howett, artificial stone. 4,556, Mundlos, means for placing bands on pulleys. 4,775, Healey, hoisting apparatus. 10,084, Boivie, manufacture of artificial stone. 16,356, Fichet & Heurtey, gas generators. 16,640, Hertwig & Liebaug, manufacture of artificial marble. 17,661, Newton (*New Jersey Wire Cloth Co.*), fireproof walls, partitions, &c. 18,810, Mitchell, appliance for illustrating the construction and operation of a valve.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"*To be rich without profusion, simple without barrenness, is the great aim of an architect.*"—Percier.

Our Plates. The new Church of All Hallows, Easton, Bristol, was consecrated recently. The scheme provides for a building capable of accommodating eight hundred worshippers, but this has not yet been completed, the work accomplished including choir, sanctuary, north and south transepts, chapel, and three bays of the nave and aisles. The style is English Gothic of the Decorated period. The walls are faced externally and internally with red pennant stone, Bath stone being used for the dressings, and an open timbered roof has been provided. The chief feature of the church is the apsidal termination of east end, which has an ambulatory around it. There is a fine altar, but the choir stalls have not yet been executed, and the pulpit is a temporary one. The church will be heated by warm air, but the apparatus (by Messrs. Haden & Son, of Trowbridge) is not yet available for use. The contractors for the building are Messrs. R. Wilkins & Sons, of Surrey Street, and the architect is Mr. George H. Oatley, of Edinburgh Chambers, Baldwin Street, Bristol.

New Buildings at Edinburgh Castle. The plans of the new buildings which the War Office authorities propose to erect to the east of the military hospital were recently presented to what might be described as a committee of taste including Lord Provost Steel, Sir George Reid, president of the Royal Scottish Academy; Mr. Morham, the city superintendent; Colonel Kirke, commanding the Royal Engineers in Scotland; and Major Hemming, R.E., from the War Office. The plans were considered wholly from the æsthetic point of view, and so regarded they were approved of generally, subject, it is understood, to certain slight modifications in outward detail. They were also on public exhibition in the City Chambers last week. The plans have been prepared at the War Office, under Major Hemming, R.E., and show a building of the castellated or Scottish baronial style of architecture, providing officers' mess-room accommodation and quarters for seventeen officers and their servants. The new structure, which is 124ft. long and 100ft. deep, is for the most part two storeys in height, but the fall in the ground at the north side is utilised for the kitchen, cellars, offices and servants' quarters, and that part of the building is thereby increased to four storeys. The site is on the Old Mills Mount, to the immediate east of the recently-erected military hospital, and the barracks now occupying the site will be demolished to make way for the new quarters, the design of which is in harmony with the architectural features of the existing buildings. On entering the Castle the new building will be to the right, after passing the Argyle battery. In front of the mess there is a terrace with a stone parapet, and on the north side a spacious flat over the billiard-room commands a view of Princes Street and the Fife coast. The plans were exhibited in elaborate detail, and showed all the sections of the work as well as the completed buildings seen from different points of view, so that one could judge of their effect on the skyline. There were also four sets of photographs showing the buildings as they now exist and as they will appear when the contemplated erection has been carried out, the views being taken from the north side of Princes Street, the foot of the Mound, the Waverley Bridge, and the Calton Hill. The probable cost is estimated at about £20,000.

The Memorial to Sir Joseph Bazalgette. The memorial to the late Sir Joseph William Bazalgette, C.B., which was unveiled on the Victoria Embankment recently by Mr. A. M. Torrance, chairman of the London County Council, is the work of Mr. George Simonds. It occupies a conspicuous position immediately facing Northumberland Avenue, and consists of a mural monument wrought in veined Sicilian marble, containing a portrait-bust in bronze of the late Sir Joseph Bazalgette. The base of the monument, rising from a sub-base of granite, consists of a carved panel embodying in arabesque design the symbols of Science and of Labour, and the central ornament from which these enrichments spring is formed by three dolphins, emblems of the tidal river. This centre panel is flanked by two low pilasters, panelled and decorated with shields, and the whole is surmounted by a heavy moulded cornice. Above this are placed two smaller pilasters, with capitals formed of the bulrush and water iris, flanking the recess in which is placed the bronze portrait-bust. In the recess above the bust hang garlands of laurel leaves, also cast in bronze, while below the bust, and resting on the cornice of the base, is a bronze plaque or label with the following inscription in raised letters: "Sir Joseph Bazalgette, C.B., Engineer of the London Main Drainage Scheme, and of this Embankment. Born 1819. Died 1891." From either side of this label, and filling the space between it and the pilasters, rise bronze branches of oak leaves and acorns. These pilasters are decorated with sunk panels of arabesque formed from the various instruments of the engineer and surveyor. The late Sir Joseph Bazalgette was one of the best known, one of the most respected, and one of the ablest engineers of the City of London. It is fitting that something should be done to perpetuate his memory.

South Wales Architects. The opening meeting the 1901-2 session of the Cardiff, South Wales and Monmouthshire Architects' Society was held on November 15th at Cardiff, when Mr. E. W. M. Corbett, F.S.I., delivered his presidential address. The chair was occupied by Colonel E. M. Bruce-Vaughan, F.R.I.B.A. In the course of his address Mr. Corbett urged upon students the necessity of taking up all branches of surveying and valuing, as well as the purely architectural branches. In order to get on in the provinces an architect required to know engineering construction, sanitary engineering, heating, lighting and ventilation. It was the lot of few to obtain a full knowledge of all those things, and many of them had of necessity to be left to specialists. The president warned the students against indulging too freely in facile designing, which encouraged the straining after effect at the cost of beauty. Designs could be worked out only with great labour, and incessant care should be taken to avoid vulgar and meretricious ornaments, introduced for the sake of originality. They had in Cardiff Castle the product of one of the giants, Mr. Burgess. Nothing was copied in it, and it remained an example of commanding merit for all time. When he (Mr. Corbett) first commenced as an architect Gothic architects had it all their own way—even public-houses had a touch of the Gothic. But their gospel of truth in design and horror of shams had had a lasting effect, and he hoped it would long endure. Speaking of the relations between the architect and his client, he said the best policy was always to be frank. The practice of taking commissions from tradesmen he characterised as absolutely dishonest. The trusted that sort of thing was rare in Cardiff, but it was not unknown. Their duty to their client was to give him the best they could at the lowest price; and could they do that if they accepted commissions or, practically, bribes? He wished the late Lord Russell's Bill had become law, and that the man who accepted a commission was liable to punishment. As regards builders they were fortunately placed in Cardiff. He had carried out about £150,000 worth of work with builders in Cardiff, and he had never yet had any serious dispute, having found them very fair in all dealings.

SOME LAW POINTS FOR ARCHITECTS AND BUILDERS.[*]

BY W. JOHNSON-ROBERTS, Solicitor.

THE subject of my paper is a very large one and I have experienced considerable difficulty in selecting from a huge mass of legal decisions the points I now bring under your notice. I have tried to avoid the better-known propositions, and have confined myself to those which, though less known, are equally important. I thought it would be more satisfactory to select a few points and discuss them with a fair amount of detail than to skim over a much larger area superficially; I have, moreover, tried to select such points as would be most likely to arise in a good general practice, and which are of frequent application, rather than more obscure ones (however interesting) which rarely occur. As the provisions of the various sanitary Acts as to drainage, privies, &c., form a fertile source of litigation, I intend to devote the major portion of my paper to the consideration of that subject. Before doing so, however, I shall say a few words about another matter which very frequently demands your consideration—that is, in the event of the demolition of a building, what are your rights and duties in respect to adjoining owners? These I will now shortly consider.

Support of Adjoining Buildings.

When the building is detached no question of importance is likely to arise save as to light and air, the law of which rather appertains to the new building; but if the building forms part of a terrace, and supports or is supported by buildings on one or both sides, a most important question then arises as to your duty in respect to the owners of the premises the lateral support of which you have withdrawn. The rights and liabilities of the parties under these circumstances I now propose to consider. In a case which was decided in Dublin some years ago these rights and liabilities were fully considered and judicially decided upon. The case to which I refer is *Kempston* v. *Butler* (Ir. C.L. Rep., vol. xii., p. 516). The plaintiff was the owner of the house No. 82, Grafton Street, between which and the house adjoining was a certain party wall which was part and parcel of both houses and upon which the beams and joists of the plaintiff's house rested, and by which party wall the other walls of the plaintiff's house were supported. The plaintiff's house and the party wall had been built more than forty years prior to the acts complained of. This fact is specifically mentioned, as in most cases this lapse of time and uninterrupted user would have given "a prescriptive right" to the continuance of the easement. It was further alleged that the defendant knew that the wall was a party wall. Now the acts complained of were that the defendant, who was a builder, had in taking down the house No. 82 (for the owner) neglected to stay and prop up the party wall securely, by reason of which neglect it fell down, and with it plaintiff's house, which was utterly destroyed. Lord Chief Justice Monahan, in delivering judgment, cited the case of *Peyton* v. *The Mayor of London* (9 B. & Cr. 725), in which it was decided that where two houses adjoined, and where they they had in fact a party wall between them, there was no such obligation cast by the law of England upon the owner of either of the houses as was sought to be thrown on the defendant there, and that either party could take down his own house provided he were guilty of no negligence in doing so; moreover, if it became necessary to shore up the adjoining house, that the duty was cast upon the owner of the adjoining house and not on the owner of the house to be taken down. The learned judge also stated "that the law says that neither party has a right to the support of the adjoining house. A custom (as was alleged) to the contrary would be unreasonable, because it would throw indirectly upon the owner of the house taken down the expense of shoring-up the adjoining house; for if the builder be employed for the purpose of taking down the house to rebuild it, he will not do so unless he be paid by the person employing him the expense of shoring-up the adjoining one." Again, in the same case, Justice Christian stated "that if two persons build a wall at their joint expense on their boundary line with the intention of each adding buildings on his own side, I can understand that each gives the natural support of his land and that he cannot be allowed to dig in his own soil so near as to weaken the foundation of the common wall. But he is not bound to supply *adventitious* supports; and if he does build against the wall, and the new house does come to afford it certain additional support, he may, notwithstanding, take down the house when he pleases; and if he leaves the party wall no worse than when he built the house, the neighbour has no right to complain. Nor can the length of time during which the house may have stood make any difference; for the existence of the support is a thing uncertain and invisible—it may be the house that supports the party wall, or the party wall that supports the house; and therefore no presumption of grant arises from continuance." This rule apparently only applies where the houses were originally built by different proprietors, and in which there is or was no community of interest save the mere common ownership of the partition wall; but if all the houses were originally built by the same person, and they mutually supported each other, and if the owner as owner of all was benefited by that mutual support, then, if he alienated one, he granted with it a share in that benefit—a benefit derived not only from the partition wall, but also from the whole house—and he retained a similar right himself for the houses he kept. This has been decided in *Richards* v. *Rose* (9 Ex. 218).

The Practical Application of the Case.

Having given you a rather full epitome of the case, I think it would be well to consider what it decided and its application. The points decided by this case are shortly these:—

(1) There is no custom in the Dublin building trade whereby a builder would be compelled to shore-up a house adjoining that which he may be demolishing.

(2) If such a custom did exist it would be unreasonable, and therefore illegal.

(3) The owner of the house being demolished is not liable either to shore-up premises adjoining those which he is demolishing, or to damages at the suit of an adjoining owner whose house falls down because it has not been shored-up.

(4) The fact that the wall which fell was a party wall in no way interferes with these conclusions.

(5) And that in cases of this kind mere lapse of time does not give a prescriptive right.

Provided always that there was no negligence in the removal, and that the foundation of the party wall was not interfered with.

The conclusions arrived at apply equally well whether the house has been standing a hundred days or a hundred years. There is, however, a most important limitation to the application of the above dicta, which is, that they only apply in the case where there never has been any other community of interest between the owner of the demolished house and the owner of the adjoining premises other than a community of interest in the ownership of the party wall.

If it can be shown that the house being demolished and the adjoining premises were all originally built and owned by the one person, and that he, as such owner, was benefited by such mutual support; then, as already stated, if he (the owner) sold or otherwise disposed of one of the houses he disposed of a share in the benefit of the support which the house gave the party wall, and reserved a similar benefit to himself, in which case it would be his duty to see that during the process of demolition the adjoining premises received the support to which they were entitled. To put the thing in a nutshell, where the premises being demolished and the adjoining premises were built and owned by one and the same person, who subsequently disposed of a portion of them, the owner of the house being demolished must give the necessary support to the adjoining premises. In any other case, granting him to be guilty of no negligence and not to have disturbed the foundation of the partition wall, he need take no trouble as to shoring-up adjoining premises save for his own safety. It would be well in all cases, however, to give notice to the adjoining owners of his intention to demolish, so that they can take such precautions as may seem fit; and in respect to premises to which the Dublin Corporation Act, 1890, applies such a notice is obligatory and the time and mode of its service are therein specifically set out. This Act is very similar to the English Metropolis Management Act, 1855. I fear I have been a little prolix in my explanation, but as the liabilities of the parties very often depend upon what at first sight may seem trivialities I have sacrificed conciseness to clearness. I trust each of you now will be in a position to determine for yourselves under what circumstances adjoining premises must be shored, and by whom, and to fix the liability in the event of accident.

I have mentioned the Dublin Corporation Act incidentally. Most people believe that under it and the sanitary Acts the Corporation have almost unlimited powers. I may admit that that was my own impression until I investigated the matter for myself. I then found that, with a very few exceptions, such is not the case. I state this specifically, as some think that the case I have been discussing has been materially altered or affected by these Acts.

Party Walls.

The Dublin Corporation Act of 1890, however, contains a few points which it might be well to consider, including a number of enactments and regulations concerning party walls. On careful reading it will be seen that they only define more clearly and amplify the rights of the building-owner and the adjoining owner over the party wall, and in no way touch upon or alter the law as to the building-owner's duty to shore it up, nor do they inflict a penalty for not doing so. They refer solely to the rights of the parties in respect to the wall itself. In certain cases you will see that awards by way of compensation are to be given to or by the building-owner in the event of injury done to it by his act. The injuries to which this refers are fairly well set out, and consist chiefly of cutting away chimney-breasts, footings, jambs, &c. No reference whatever is made to injury caused by the building-owner by the withdrawal of the support of the house being demolished. Of course, I do not advise you in every, or possibly any, case to dispense with such shoring as may be necessary for the safety of your workmen or the protection of your works. I merely desire to point out your rights and duties considered from a strictly legal point of view.

I will now proceed to another branch of my subject. We will suppose that the existing building has been successfully demolished and that the question of shoring or propping has been satisfactorily solved. The next important question which would then present itself to us is the question of the sewerage and sanitary accommodation. The law on these subjects naturally resolves itself into two parts—one, the law as applicable to newly-erected or rebuilt houses; the other, the law as applicable to houses already built. Let us consider the newly-built or rebuilt houses first.

The Sewerage of Newly-Built Houses.

We all know what a newly-built house is, but what exactly constitutes a rebuilt house is not so clear. A house is considered to have been rebuilt within the meaning of the sanitary Acts[*] if it is a building which has been pulled down to or below the ground floor, or any frame building of which only the framework is left down to the ground floor; or the conversion into a dwelling-house of any building not originally constructed for human habitation; or the conversion into more than one dwelling-house of a building constructed as one dwelling-house only—this shall be considered the erection of a new building (and whenever any old building has been taken down to the extent of one-half of such building, such half to be measured in cubic feet, the rebuilding to be considered a new building)* for the purposes of the Act (Public Health Act, Ireland, 1878, section 43). Therefore, for the purposes of this part of the Public Health Act new houses and houses which have been extensively rebuilt are in the same category. Such being the case, let us consider the provisions of the Public Health Act affecting such structures.

---

[*] A paper read before the Architectural Association of Ireland on November 5th 1901.

[*] The chief Irish Act is the Public Health Act of 1878; corresponding to the English Public Health Act of 1875, of which it is almost a counterpart. The Public Health Act next in importance is that of 1890, which is applicable to England, Wales and Ireland, exclusive of the administrative county of London.

By section 44 (section 3 of the English Act) it is enacted that "it shall not be lawful to newly erect or rebuild as above defined any building without sufficient water-closet, earth-closet or privy accommodation, and an ashpit covered with proper doors and coverings." I do not believe I am wrong in stating that almost every word of this section has given rise to important litigation. What is "a building"? What is "sufficient water-closet, earth-closet or privy accommodation"? Who is to be the judge of its sufficiency? Is there any appeal from his decision? Has the owner of the house being erected the option of selecting the form of sanitary convenience he proposes to adopt, or must he follow the dictates of the judge of the sufficiency? All these questions are of the utmost importance, and I will now consider them separately.

Legal Definition of a "Building."

Let us start at the first. What is "a building" within the meaning of the Act? As no definition of this word is given in the Act, it might be well to consider a few kinds of structures which have been held to be buildings. I shall merely give a few of the principal decisions affecting this point. In England a dissenting chapel has been held to be a house capable of human habitation, but a church consecrated by law to ecclesiastical purposes for ever is not (*Wright* v. *Ingle*, 16 Q.B.D. 379; *Caiger* v. *Vestry of St. Mary, Islington*, 50 L.J.M.C. 59; *Angell* v. *Vestry of Paddington*, L.R. 3 Q.B. 714). For the purpose of the Nuisance section of the Public Health Act a ship is a house (section 126, which is section 110 of the English Act).

However, temporary structures of bricks and mortar used for the storage of tools during the erection of some cottages were held not to be buildings within the meaning of a by-law which required plans of intended structures to be deposited, and the by-law was declared bad (*Fielding* v. *Rhyl Improvement Commissioners*, 3 C.P.D. 272). Arches under a roadway in certain cases have been held to be buildings (*Thompson* v. *Sunderland Gas Co.*, 2 Ex. Div. 429).

Sufficiency of Sanitary Accommodation.

Now as to the sufficiency of the sanitary accommodation to be provided. Under section 44 of the Public Health Act, 1878—which is section 35 of the English Act, and which applies to newly-built and rebuilt houses—it appears that the sanitary authorities are the proper judges. An appeal lies from their decision to the Local Government Board so far the law as to *newly built* or *rebuilt* buildings is concerned.

I will now consider our rights and the law respecting *already existing* dwellings with regard to the questions already discussed. The judges of the sufficiency of existing sanitary accommodation under this section (section 45—36 of the English Act)—are again the sanitary authorities. They are the sole judges subject to appeal. The only appeal for practical purposes in proceedings under this section is to the Local Government Board, who have the power of revising the decision of the sanitary authorities. An appeal also lies from their decision to the Court of Quarter Sessions (in Dublin quarter session district to the Recorder), thence to the King's Bench on special case, then to the Court of Appeal, and ultimately, if so desired, to the House of Lords. But it would have to be on some other question than the "sufficiency" of the sanitary accommodation; it is, therefore, of little use. Proceedings are, however, very rarely taken in this country under this section (36 of the English Act, 45 of the Irish Act of 1878) because the justice is not empowered to inflict any penalty for non-compliance with his order, as he can do under section 44 (35 of the English Act). What the sanitary authorities have to do in the event of non-compliance with an order under this section is to do the work themselves and sue the owner for the cost as private improvement expenses, or recover it under the Summary Jurisdiction Acts. As this necessitates an immediate expenditure, to be followed by a more or less problematic return, and possibly by a loss to the sanitary authority in the event of the owner's appeal to the Local Government Board being successful, it is rarely resorted to. Moreover, the Local Government Board's opinion on the sufficiency of the sanitary accommodation cannot be had until the sanitary authorities have expended their money. Therefore questions as to the rectification or insufficiency of sanitary conveniences in existing dwellings or buildings are generally determined by proceedings under section 107 (91 of the English Act)—the Nuisance section. In this event the justice (represented in the Dublin Metropolitan Police District by the police magistrate) becomes the judge of the sufficiency of the existing arrangements. He has absolute power and discretion, with or without the approval of the sanitary authorities, to direct whatever is necessary to abate the nuisance; and, in the words of the learned judge in *Whitaker* v. *Derby Urban Sanitary Authorities* (55 L.J.M.C. 8), "the justices are absolutely unfettered in their judgment." A right of appeal exists both to the Local Government Board and to the Superior Courts.

Owner's Right of Selection.

We now come to consider an important limitation on the discretion of the justices, which is, the right of the owner to select the form of sanitary convenience he will adopt. Popular opinion has it (at least in the city of Dublin) that if the sanitary authorities insist upon having a water-closet, a water-closet they must have. This is entirely wrong. The owner can, if he so desires, put in privies in a new building in Merrion Square or Grafton Street, and, according to the highest legal authorities, there is no law in the land to prevent him doing so. Whatever may be the opinion of your profession as to the respective merits of the water-closet, earth-closet and privy methods of sanitation, we all, I think, agree that the water-closet hobby has been ridden to death in this city. From a layman's point of view, and as one who owns considerable property in the city and suburbs, I must say that a water-borne system of sewerage, especially when associated with fragile and easily disarranged mechanical contrivances, is eminently unsuited to the vast majority of the poorer class of cottages and tenement houses in Dublin. Yet, year after year, the justices have, at the request of the sanitary authorities, compelled this form of sanitary convenience to be used to the exclusion of all others. In a very recent case which was heard before the metropolitan justices, in which I appeared for the owner, this very question arose.* The Pembroke Urban District Council, who were the plaintiffs, summoned the owner because (*inter alia*) he refused to substitute water-closets for privies in certain small cottages in Shaw's Lane, Bath Avenue. The magistrates stated that it had been the invariable practice of the court to make the order demanded, yet on the authority of some recent cases which I cited they refused to do so then. The privies therefore remain unchanged to the present moment. As this view of the law may be novel to some, I think it will do no harm to read a few extracts from the leading decisions on the point. The case of *Whitaker* v. *Derby Urban Sanitary Authorities* (55 L.J.M.C. 8) decides that even under section 45 (section 36 of the English Act), which vests absolute discretion on the sanitary authorities, that notice to put in a particular kind of closet, *e.g.*, a water-closet—without giving the owner the statutable option of a water-closet, earth-closet or privy—is bad. Moreover, section 46 of the Public Health Act (section 37 of the English Act) says that "any enactment in force within the district of any sanitary authority requiring the construction of a water-closet *shall* be deemed to be satisfied by the construction, with the approval of the sanitary authority, of an earth-closet." An earth-closet is there defined to include "any place for the reception and deodorisation of fæcal matter constructed to the satisfaction of the sanitary authority." That the sanitary authorities cannot arbitrarily withhold their approval from any and every form of earth-closet has been repeatedly decided. The mere fact that they have a system of water-borne excreta-removal is no reason why an owner should not adopt an earth system if he so desires. In the important case of *Barnett* v. *Laskey* (68 Q.B., L.J. 55, 1899; 79 L.T. 408), which was decided about a year and a half ago, it was stated that "the use of the privy system is nowhere condemned." If any conjunction of circumstances would have warranted a sanitary body insisting on the substitution of water-closets for privies, this was the one. In this case certain privies and ashpits became infested with typhoid germs, which penetrated into the walls and brickwork of the structures. Several ineffectual attempts were made by the sanitary authorities to destroy them, and ultimately proceedings were taken against the owner under the section of the English Public Health Act (section 91) corresponding with the Nuisance section of the Irish Act. Moreover, it was alleged that the fact of the floors and walls not being concreted constituted *a structural defect* within the meaning of section 110 (section 94 of the English Act). The Lord Chief Justice (Lord Russell of Killowen), in delivering judgment, said: "Counsel for the respondent (the sanitary authorities) said they (the privies and ashpits) ought to have been concreted, but there is no evidence that this is usual or would have prevented the penetration of these germs; on the contrary, it appears that in time they would get even through concrete. Therefore the absence of concrete floors and walls is not a structural defect in privies within the meaning of section 94 of the Public Health Act (section 110 of the Irish Public Health Act of 1878). *The Legislature has nowhere condemned the use of the privy system.*" And in the report of the same case in the "Law Times," at p. 411, the following additional remarks of the Lord Chief Justice appear in answer to the question, What is a structural defect?: "It is said that they (the privies and ashpits) ought to be concreted. But is that usual in such places as these; and even if they were concreted would that be of any avail, for it is stated in the case as a fact that these creatures (the bacteria) can in time penetrate porcelain. The Legislature has nowhere condemned the privy system." Justice Wills, in concurring, said: "In other words it is argued that they (the nuisances) arose from the privy system being in use, not the water-closet system. *I entirely agree with the Lord Chief Justice that it is not fair to throw upon the owners of property the change from the privy system to the water-closet system without any expression on that behalf by the Legislature.*"

Nuisances.

Before leaving this part of my subject it might be well to mention two matters which are more or less directly connected with what we have been discussing. One is, in the event of the adoption of an earth-closet or privy system in premises which have no back exit, and in which consequently the excreta, &c., would have to be emptied through the house, would that fact constitute a nuisance and prevent the owner from exercising his option? In my opinion it would not, for the following reasons: In the first place (although the point has never been actually decided), it seems pretty clear that the removal of excreta in that way would not be a nuisance under any of the sub-sections of section 110 of the Public Health Act, 1878 (section 91 of the English Act, 1875). In this connection I will read you a few extracts from a recent Irish case—that of the *Great Northern Railway Company* v. *The Lurgan Commissioners* (2 Ir. Reports, Q.B., 1897, p. 340). It was an appeal from a judgment given in favour of the sanitary authorities under the following circumstances:—The Great Northern Railway Company, as common carriers, had to carry large quantities of manure consigned to various farmers along their line. Such a consignment was made to Dundalk. The Great Northern Railway Company's station is almost in the centre of that town, and, consequently, when large consignments of manure arrived and (as they frequently did) lay there uncalled for

---

* English Public Health Act, 1875, section 159. The section does not contain the part in brackets, which is in the Irish Act only.

* *Pembroke Urban District Council* v. *Whitty*. This case is not reported in the law reports, but a very accurate and exhaustive report of it appears in the "Irish Builder" for June 6th, 1901.

for days or possibly weeks, the result was very unpleasant for the inhabitants. The local justices, as I before stated, held this to be a nuisance. On appeal they were held to be wrong. Justice Holmes said: "All through the Act 'nuisance' appears in conjunction with the alternative 'injurious to health' and 'a nuisance or injurious to health,' and would seem to apply to something of a *permanent* character. Take the case of a trader rolling barrels into his stores, a case that has given rise to a great deal of litigation in England. Can it be suggested that section 107 (the Nuisance section)—section 91 of the English Act—was intended to apply to such a matter at all? Take any of the sub-sections of section 107. There is an idea of permanence running through them all. There is sub-section B, 'any animal so *kept* as to be a nuisance or injurious to health.' Take sub-section C, 'any factory, &c., not *kept* in a cleanly state.' I do not say, or mean to say, that there should not be legislation on these matters, or that penalties should only be imposed on nuisances that are in some measure permanent; but we must look to the scope of this Act, which is to enable the sanitary authority to keep the district in a sanitary state." Justice Johnson added, "The illustrations in the schedule forms also point to something of a permanent nature"; Justice Holmes adding, "The delivery of coal might equally, it would seem, amount to a nuisance within the subsection if this is." Now, what we learn from the decision is that any act or thing alleged to be a nuisance must be more or less of a permanent nature. A mere temporary act would not constitute a nuisance under this section of the Public Health Act, even although it were so undeniably if it were permanent, and even though it might be a nuisance at common law. We all know that there are at present numbers of first-class houses in Dublin the refuse from which has always to be brought through the house for removal. If removing the refuse in this way constitutes a nuisance, these houses should be shut up as unfit for human habitation.

The Drainage Question.

We will now suppose that the method of refuse-disposal has been got over as satisfactorily as our previous difficulties, and that we now have to face the drainage question—for there must be drainage of some sort, if for no other purpose than for removing the surface water. As my paper deals chiefly with cases under the Public Health Act and the Dublin Corporation Act (53 & 54 Vict., c. ccxlvi.). I think it would be well to get a clear idea of the meaning of the words "drain" and "sewer" under these Acts before proceeding further. You can see for yourselves, by reference to the Interpretation section of the Dublin Corporation Act (section 5), that "lands," "premises," "owner," "street," "house," "drain" and "sewer" shall have the meanings assigned to them respectively by the Public Health Act, 1878. The effect of this enactment is to make all decisions under the Public Health Act on these words applicable to the Dublin Corporation Act. Under the Definition section of the Public Health Act (section 2 of Irish Act, 1875; section 4 of English Act, 1878) a drain is defined to be "any drain of and used for the drainage of one building only, or of premises within the same curtilage and made merely for the purpose of communicating therefrom with a cesspool or other like receptacle for drainage, or with a sewer into which the drainage of two or more buildings or premises occupied by different persons is conveyed." A "sewer" is defined as including "sewers and drains of every description, except drains to which the word drain interpreted as aforesaid applies, and except drains vested in or under the control of any authority not being a sanitary authority under this Act."

To take a simple case, if the drain you put in receives the drainage of one building only or of premises within the same curtilage, of course it is a "drain" within the meaning of the Act. If it receives the drainage of more than one building or of premises other than those within its own curtilage, it becomes a "sewer." (Curtilage practically means the building with its yard and out-offices.) Now the rights and responsibilities of the owners of premises which are drained by sewers, and the rights of owners whose premises are drained by drains, are vastly different and each very important. It may be well here to point out what constitutes a "drain": Firstly, it must be the drain of a building or premises within the same curtilage; secondly, it must be used for the drainage of the building or premises within its curtilage; thirdly, it must be made merely for the purpose of communicating therefrom with a cesspool or similar receptacle for drainage or a sewer into which the drainage of two or more buildings or premises occupied by different persons is conveyed. Every other description of drain or sewer is a "sewer" within the meaning of the Act. There is a general but mistaken impression that to make a "drain" a "sewer" within the meaning of this section of the Act they must all belong to the one owner. This is not at all necessary. They may belong to one owner or to several owners. In considering whether a certain conduit is a "drain" or a "sewer" under the Public Health Act of 1878, the question of ownership does not arise. If it empties into a sewer conveying the drainage of two or more buildings occupied by different persons, and complies with the other requisites above set out, it is a "drain"; and if it drains more than two buildings it becomes a "sewer."

"Private Drains."

Let us now consider the effect of section 19 of the Public Health Act of 1890. In this section we meet for the first time a new form of drain, which is therein described as a "private drain." There is no interpretation of this term in the Act. These words would seem to be used in opposition to the words "public sewer" used immediately previous to them in the same sentence. As far as can be gathered from the wording of this section, "private drain" is equivalent to the word "drain" as interpreted in the Public Health Act of 1878. For the purposes of this section (section 19), *and for these purposes only*, the word "drain" is given an extended meaning, and is made to include a "drain" used for the drainage of more than one building. Moreover, this amplified interpretation of the word "drain" is only allowable in the event of the houses drained belonging to *different owners*, and when the proceedings in relation to the drain are taken under section 51 of the Public Health Act of 1878 (section 41 of the English Public Health Act of 1875). Except when the premises belong to different owners and the proceedings are taken under the section above mentioned. the interpretation of the word "drain" remains unaltered. Under the section last referred to, the sanitary authorities, on the written application of any person to them that any drains, water-closets, &c., are a nuisance or injurious to health, but not otherwise, may examine the same and execute or compel the execution of whatever works they deem to be necessary, and recover the expenses as under section 45 (section 36 of the English Act). The magistrate cannot entertain the question as to whether the works were necessary or not, the only way to raise this question being by appeal to the Local Government Board under section 268 (section 268 of the English Act). Considerable doubt exists as to whether or not this section is retrospective, conflicting decisions existing on the point. This section applies to the drains of "houses." Section 2 of the Act of 1878 (section 4 of the English Act of 1878) refers in the heading "drain" to the drains of "buildings or premises." What (if any) the effect of this difference in the wording is, remains to be seen. Another awkward point in connection with this section is that the expenses shall be assessed in such shares as shall be settled by the "surveyor" of the sanitary authorities. Further, in section 11 of the Act of 1890 "surveyor" is declared to have the same meaning as under the Public Health Act of 1878. Now, under that Act we have no interpretation whatever of the word "surveyor," and who that gentleman is we have yet to learn judicially. I think I have said enough to convince you of the correctness of Lord Russell of Killowen's statement that the legislation on this subject is in a very unsystematic and chaotic condition.

Section 60 of the Dublin Corporation Act enacts "that where any dwelling-house *in the city* is drained only by a brick or built drain the house shall be deemed to be without a drain sufficient for effectual drainage within the meaning of section 25 of the Public Health Act, and that section shall be construed and have effect accordingly." The twenty-fifth section of the Public Health Act above referred to deals with the power of the sanitary authorities to enforce the drainage of undrained houses. Under the Public Health Act, 1878, section 25 (section 23 of the English Act) the owner can only be compelled to put in "covered drains," the requirements of which section would be complied with by a brick drain. Now, however, in the city of Dublin brick drains can no longer be used.

Drains and Sewers.

Let us now resume our consideration of the distinction between a drain and a sewer. A drain is, as we know, a drain used for the drainage of one building or premises within the same curtilage; a sewer is any other kind of a drain. Now, under section 15 of the Public Health Act, 1878 (section 13 of English Act), "all existing and future sewers within the district of a sanitary authority, together with all buildings, works, materials, and things belonging thereto, shall (with the exceptions therein set out) vest in and be under the control of the sanitary authority," and section 17 (section 15 in the English Public Health Act) makes the "sanitary authority keep in repair all sewers belonging to them."

This means that the sanitary authorities are responsible for the upkeep of any "private drain" which has by reason of its draining more than one building become a "sewer," and that whenever it goes out of order they must put it into a proper state of repair at their own expense. Of course this is a very satisfactory state of things for the owner, but possibly not quite so satisfactory for the sanitary authorities. Now, whenever a drain receives the drainage of more than one house, from the point when the sewage of the second house enters it it becomes a sewer, and as such vests in the sanitary authorities. Whether it runs under your drawing-room or under your garden, whether it pursues its course along the public thoroughfare or through private ways, matters not; if it carries the drainage of more than one house it becomes a sewer. This was decided in the well-known case of *Travis* v. *Uttley* (1894, 1 Q.B. 233), in which Justice Wright, in delivering judgment upon this very distinction between a "drain" and a "sewer," said: "To hold that what is really a private drain vests as a sewer in a local authority is to hold that a local authority can take away part of a man's land in order to perform its functions, and is also liable for the cost of keeping private property in repair—two apparent absurdities; but the words of the section are plain, and the results may possibly have been intended in order to avoid dealing with the complex right of several houses to use the same drain. No limitation of the definition of the word 'drain' seems possible. It cannot be said to apply to a drain which is part of a house, for a drain like this may run under a long row of houses not held by the same person nor under one title; or to apply only to drains which run through land dedicated to public uses, because in many towns the main sewers run under public houses or buildings, and they clearly ought not for this reason be taken out of the control of the local authority." By Justice Wills: "This drain is used for the drainage of more than one building. It is therefore a sewer." Now, in order to be either a "drain" or a "sewer" the conduit must be used for drainage. This brings us to the question,

What is Drainage?

Within the meaning of the sanitary Acts "drainage" and "sewage" are almost synonymous terms. The common idea that a conduit to be a drain must carry sewage is absolutely erroneous. Any conduit, even though it conveys uncontaminated rainwater or surface-water only, is a drain within the meaning of the sanitary Acts. To quote the words of Lord Justice Smith in *Ferrand* v. *Hallas Land Building Co.* (L.R., 1893, 2 Q.B., p. 144), "A sewer need not necessarily convey sewage matter in order to constitute it a sewer. It would be none the less a sewer within the Act of 1875 (the English Public Health Act, if it conveyed only rain- or surface-water. The draining-off of rain- or surface-water collected from different premises by different feeders into one main drain would

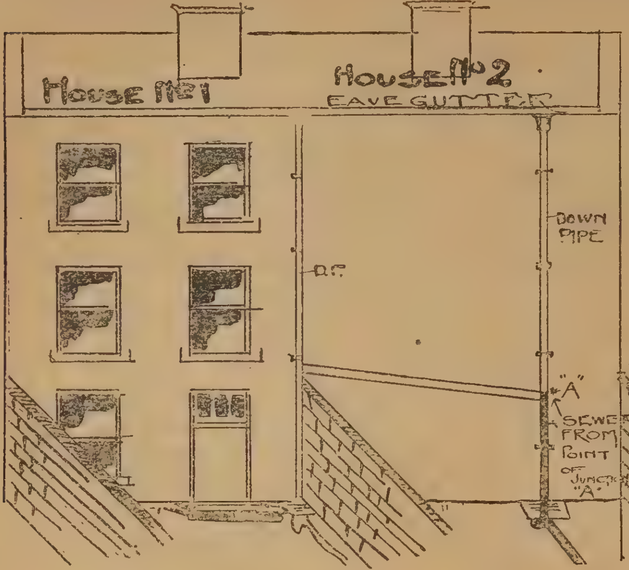


FIG. 1.

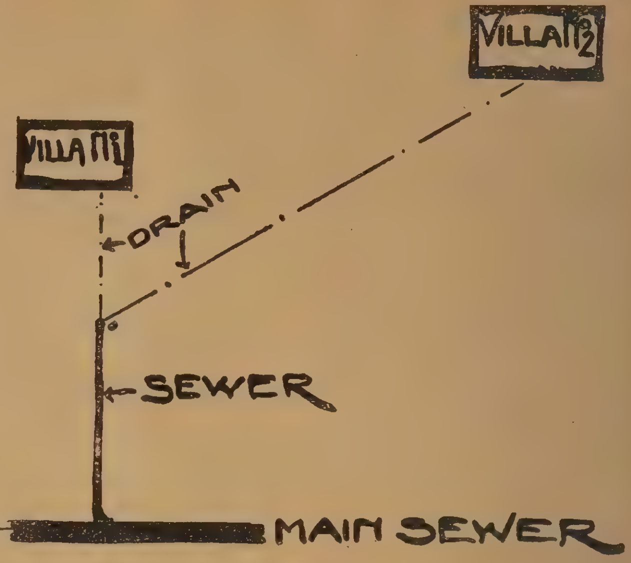

FIG. 2.

constitute that main drain a sewer within the meaning of the Act." To have consistently decided otherwise would seem impossible. To have limited the application of the words "drain" and "sewer" to conduits carrying sewage matter only would have rendered nugatory a large portion of the Public Health Acts by creating a species of conduit which, although *de facto* a drain, and possibly untrapped, badly-constructed and communicating with the main or public sewer, would yet be absolutely free from the operation of the sanitary Acts. Moreover, such an interpretation—or rather limitation—of the meaning of the word "drainage" would be absolutely at variance with its plain meaning. When we speak of the drainage of premises we include in the term the water from the roof, the surface-water from the yard, and the liquid refuse from the house. Now, as I have already told you, it has been decided that the purest rainwater is as much sewage as the filthiest refuse from a closet, and that the conduit carrying either or both of these things is a drain or a sewer, as the case may be.

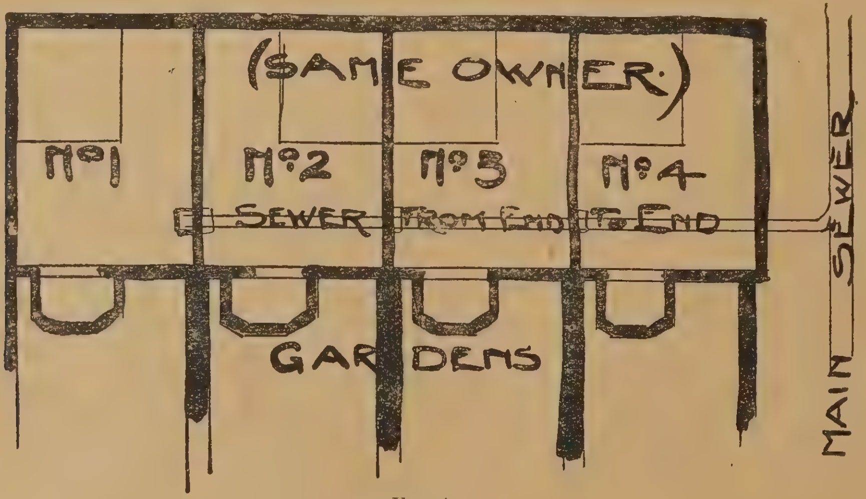

FIG. 4.

I will point out to you the far-reaching effect of this decision shortly, but before doing so I will say a few more words about what a drain must be, or rather what it need not be. Under section 25 of the Public Health Act of 1878 (section 23 of the English Act), which, however, applies *only* to undrained or insufficiently-drained houses already existing, and under section 27, which gives urban authorities similar powers over newly-erected or rebuilt houses in their district, the sanitary authorities have power to regulate the size, shape and location of the drains of a house. It is most important, however, to bear in mind that once a house has sufficient drainage to the satisfaction of the sanitary authorities, and so long as no nuisance or state of things injurious to health exists, the sanitary authorities have no power whatever to prevent the owner making any number of supplemental drains he may like, or placing them anywhere he wishes. There is also a provision in the Dublin Corporation Act (section 60) enabling the metropolitan sanitary authorities to require new pipe-drainage for premises which are only drained by a brick or built drain. That is, however, only a minor point. I want you to remember, first, that it is settled law that a conduit carrying rainwater only is a drain within the meaning of the Public Health Acts; and secondly, that with the exceptions I have mentioned you may have your drain anywhere and of any materials. By this time some of you will probably be thinking if that be so the gutters on your roof or the down pipes may be drains or possibly even sewers. That is a perfectly logical and, in my opinion, a perfectly correct inference. The Public Health Act enables the sanitary authorities to proceed under sections 25 and 27 only in the event of the premises being without sufficiently effectual drainage. Once there is sufficient and effectual drainage the powers of the sanitary authorities are at an end.

We will presume that such drainage exists. Consequently, as above stated, the owner can now put in as many additional drains as he thinks fit. The additional drainage he indulges in is usually confined to small drains, draining the surface-water from the yard or garden, and the rainwater from the roof of the house and out-offices. The latter drains, though they be but gutters and down pipes, are none the less "drains" within the meaning of the Public Health Act. If there were a dozen of these, all emptying into the one main drain, the latter would still be a drain, provided all the premises drained were within the same curtilage; but let the rainwater from an adjoining house or the surface-water from an adjoining yard be emptied into one of our drains, then, behold, the latter becomes a sewer from the point of junction. This is equally true whether the drain be from a water-closet and runs 6ft. under the ground, or whether it be a drain in the shape of an eaves-gutter draining the rainwater from the roof 60ft. above the ground; from the point where it receives the drainage of more than one house it becomes a sewer. Thus arises the extraordinary fact that the very gutters on our roof and the down pipes on our walls may be public sewers. A case was decided only last year in which the more weighty and only doubtful part of this proposition received judicial approval. I refer to the case of *Holland* v. *Lazarus* (L.J., 1897, N.S., vol. 66, Q.B., p. 286). There Mr. Justice Bruce held that a rainwater pipe was a drain for the drainage of a building within the meaning of section 250 of the Metropolis Management Act, and that the fact of it being connected (even without the knowledge or permission of the sanitary authorities) with a drain which drained an adjoining house turned the latter drain into a sewer. Now we know by the Definition section of the Public Health Act that any drain which drains more than one building becomes a sewer. We know also that sewers vest in the sanitary authorities. *Holland* v. *Lazarus* practically decides that a down pipe is a drain within the meaning of the Public Health Act. By the same reasoning one arrives at the inevitable conclusion that every gutter and down pipe used for the drainage of a building is a drain; therefore, if we regard them as drains—which we must—the decision in *Travis* v. *Uttley* brings us a step further, and says that when a drain receives the drainage of more than

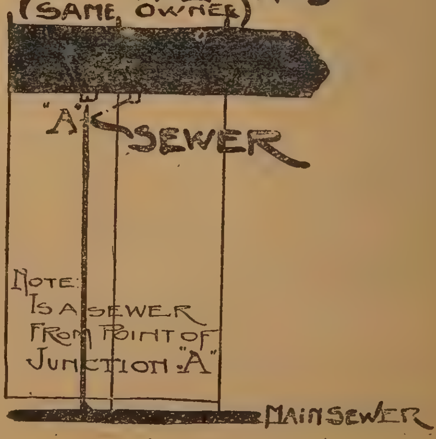

FIG. 3.

one building it becomes a sewer, and as such vests in the sanitary authorities. That is what may actually happen to our gutters or down pipes. This may seem an astounding proposition, but if you consider it carefully you will find that it is only the logical outcome of these decisions and the law on the subject.

I will now refer to the accompanying diagrams. Fig. 1 shows two houses which, for the sake of illustration, we will suppose have no sewer, drains, &c., in such a state as to be a nuisance or injurious to health. That being so, it is immaterial to us whether the houses be owned by the same owner or by different owners. As is seen, each has a separate set of eaves-gutters and down pipes emptying into a gulley in the yard connected with a drain. Our handyman comes along and by merely connecting the two down pipes he turns the one which receives the drainage of the second house into a sewer, from the point where the connection is made. The same result would have been achieved if he abolished one of the down pipes and let the one set of eaves-gutters and the remaining down pipe drain the roofs of the two houses. In that case the entire down pipe and the portion of the eaves-gutter which carried the drainage of more than the one house would have become sewers. Of course if they belong to different owners, in the event of a nuisance arising and proceedings being taken under section 51 of the Irish Public Health Act (section 19 of the Public Health Act of 1890) this will, for the purposes of that section, only cause them to be regarded as a "private drain," and will enable the sanitary authorities to sue for works executed on them.

Fig. 2 shows us two villas served by the one drain, in which the drain from the point of junction becomes a sewer, and which, although it runs through private grounds, is yet a sewer, maintainable by the sanitary authorities.

Fig. 3 shows a very usual way by which a drain may become a sewer. The drain of No. 2 has become choked, and the inevitable handyman connects it just between the stoppage and the house with that of No. 1, thereby converting the latter drain into a sewer from the point of junction.

Fig 4 shows the same principle applies even though the drain runs under the drawing-room.

Figs. 5, 6 and 7 show the effect of ownership on this question when considered in connection with section 19 of the Act of 1890. Fig. 5 shows an undoubted drain; Figs. 6 and 7 show an identical system of drainage which in one case (Fig. 6) by the operation of and for the purposes of section 19 only, by reason of the houses being owned by different owners, remains a drain, while for all other purposes it is a sewer. Fig. 7 shows that for all purposes the drain of the second house becomes a sewer from the point where it receives the sewage of more than one house, because the two houses are owned by the same person.

Fig. 8 is a further example of the principle shown in Fig. 1.

Some Practical Advice.

I have almost reached the limits of my paper, and will now give you a few words of practical advice and a short *résumé* of what I have said.

When demolishing buildings, provided you have not been guilty of negligence and do not undermine the foundations, of the party or division wall or unnecessarily injure it, and provided that the adjoining houses were not built and owned by the same person, you are not bound (save only for your own safety or that of your employées) to shore-up adjoining structures; and if same fall in the course of your operations, you are not responsible for the result. In building operations in the city of Dublin it is necessary to serve the notice required by the Dublin Corporation Act in addition.

As to the kind of sanitary accommodation you will adopt, as I have showed, you can, with the exceptions pointed out, have a water-closet, privy or earth-closet, as you desire. The sanitary authorities of any urban or rural district may compel any existing house to be sufficiently drained. There is another point in connection with drains and sewers which it is well to remember, that the sanitary authorities cannot compel an owner or occupier of premises within their district to employ their workman to make the necessary connection between his drain and their sewer. The owner has a perfect right to do this himself and by his own workmen; the sanitary authorities may, however, direct the mode in which the work is to be done, and may even appoint a superintendent, but beyond this they cannot go (see section 23 – section 21 of the English Act, 1875).

There is yet another little point to which I will refer, because it is so little known and of such general utility. It is that in all the proceedings under the Nuisance section of the Public Health Acts, where the magistrates order a nuisance to be abated within a certain number of days the time allowed does not run until the service of a copy of the order on the person against whom it is made. The usual impression is that, when the magistrate gives (say) fourteen days to execute certain works, the time runs from the date of his order. This is not so. The time runs from the date of the service of the order.

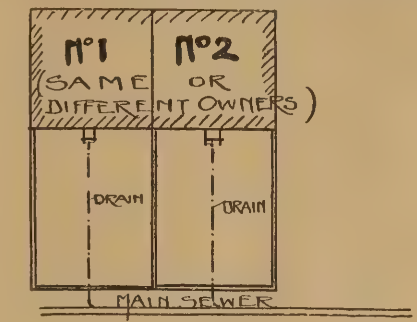

FIG 5.

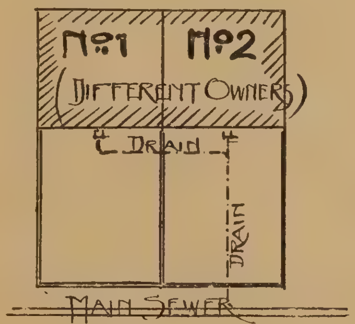

FIG. 6.

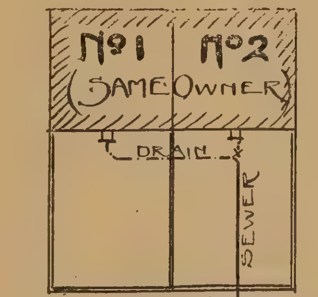

FIG. 7.

To revert again for a moment to the drain and sewer questions, it may be in the experience of some of you that the important connection which makes one drain drain two houses and thereby turns it into a sewer was made surreptitiously and without the knowledge and consent of the sanitary authorities. This frequently occurs, but does not alter the law of the case in the slightest degree. This very point was decided in the case of *Kershaw* v. *Taylor* (1895, L.R 2 Q.B. 208, 471). In that case the builder had erected four houses the drainage of all of which he had carried into the sewer in the road by means of a single drain, contrary to the plan submitted by him to the sanitary authority and sanctioned by them. He subsequently sold the houses to different purchasers. In a proceeding to compel the purchaser of the premises in which the drain which so received the drainage of the four houses was situate to repair it for the purpose of remedying a nuisance caused by its defective condition it was held by Justices Wright and Kennedy that this "drain" was a "sewer" and not a "drain"; that the purchaser was not estopped by the wrongful act of his predecessor in title from alleging that it was a "sewer," and that the duty of repairing it consequently lay not on him but on the sanitary authority. Lord Justice Kaye said: "An attempt is made to get behind this conclusion by saying that the houses have been drained without the knowledge of the local authority, who ought therefore to be entitled to say that the drainage is not by a sewer but by a drain. The question, however, is *rebus sic stantibus*—is this a drain or a sewer? And want of knowledge on the part of the local authority is no answer to the assertion of the respondent that he is not liable for anything but a drain. The conversion of what would have been a drain into a sewer was not by any act of the respondent, and there is no estoppel against him." The decision in this case was followed in several other important cases. Amongst them was the case of *Florence* v. *Paddington Vestry* (12. T.L.R. 30). In this case the defendants had given the plaintiff notice to repair a defective drain. On opening up the ground he discovered for the first time that premises belonging to another owner were drained through this drain, and the connection had been made unlawfully without the consent of the plaintiff or his predecessors in title. Mr. Justice Chitty declared that he was entitled to a declaration that the drain was a sewer, and to be repaid by the defendants the money he had expended in repairing it. It may seem to some that if the law as I have shown it to be were strictly enforced sanitary authorities would be involved in enormous expenditure, especially on the question of "drain" or "sewer" as applied to eaves-gutters, &c. This in no way influences the decision of the courts on the points of law which may arise before them. They decide the cases according to the law, however unpleasant may be the results for private individuals or corporations. In this connection I cannot do better than give you an extract from a case in which this was very clearly set out. I refer to the case of the *Attorney-General* v. *Town Council of Birmingham* (4 K. and J. 528, 6 W., R. 811). An injunction was granted to restrain the defendants from carrying out their drainage operations. On defendants' behalf it was alleged that if the drains were stopped all the sewers of the town would overflow, and that Birmingham would be converted into one vast cesspool. Per Wood, V.C.—"It has been urged upon me more than once during the argument by the counsel for the defendants that there are 250,000 inhabitants in Birmingham, and that this circumstance must be taken into consideration in determining the question of the plaintiff's rights to an injunction. . . . . In the case of an individual claiming certain private rights, and seeking to have those rights protected against an infraction of the law, the question is simply whether he has those rights, and, if so, the court, looking to the precedents by which it must be governed in the exercise of its judicial discretion, can interfere to protect them. Now, with regard to the question of the plaintiff's right to an injunction, it appears to me that so far as this court is concerned it is a matter of almost absolute indifference whether the decision will affect a population of 250,000 or a single individual carrying on a manufactory for his own benefit."

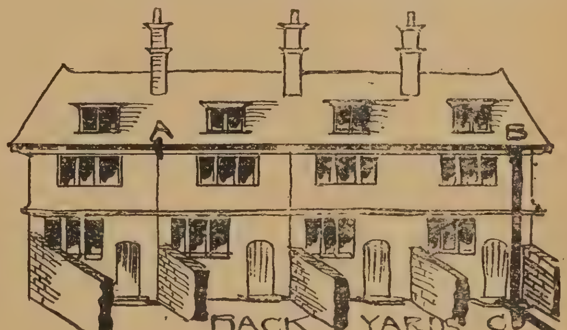

FIG. 8.

I trust that the points I have dealt with will not be without interest and value to you.

Masters and Men.

The Penrhyn Quarry.—Since work was resumed at the quarry on June 11th the number of men employed has steadily increased, especially during the last month, which showed an increase of forty, the increase during September having been twenty-seven. These included twenty-nine slate-makers and thirty-eight labourers and day-men. The production of slates has similarly increased very satisfactorily; in fact, the output last month was at the rate of 34,000 tons per annum.

The Metal Trades of Birmingham.—At a meeting yesterday of employers and workmen engaged in the metal trades of Birmingham and district it was decided to terminate the alliance, which has existed for the past five years. Between 4,000 and 5,000 men are affected. The 5 per cent. bonus which the men are at present receiving is to be the subject of further consideration. The alliance has never been very successful, owing to several of the largest firms of metal-rollers declining to join. The decision to terminate it was taken on the initiative of employers, many of whom were dissatisfied with it.

Trouble in Birmingham.—The builders' labourers section of the Birmingham Wages Board have met the proposal of the masters to reduce wages by ½d. per hour from April 1st next by a counter-claim for an advance. The carpenters and joiners will also ask for a ½d. advance. They will also resist the proposed alteration of the working rules, which leaves the rating of a workman as superior or inferior, with wages accordingly, to the employer—a rule which was abandoned as far back as 1890—and another stipulating that a full working week shall be made before overtime is charged, work to commence at 6 a.m. instead of 6.30.

Surveying and Sanitary Notes.

Mr. J. A. Wallington, a well-known surveyor and land agent, has died at Chineham, Basingstoke at the age of forty-eight. He had an extensive practice in Basingstoke, and during the last three or four years acted as surveyor for the L. and S.W.R. in that neighbourhood.

The Westminster Paving Scandal.—Mr. J. Mac-Connell, hon. secretary of the Wesminster Ratepayers' Committee, sends us a lengthy circular condemning the "bogus enquiry" of the Westminster City Council Works Committee into the allegations of favouritism and jobbery in the paving contracts, which enquiry is described as utterly worthless. With regard to the 8in. deal contract, it is said: "A perusal of the laboured report relating to this shows that the whole of the facts disclosed by our Committee are absolutely correct in every detail, and by not rescinding this iniquitous contract the Works Committee have deliberately flouted every responsible and public opinion." With regard to the statement in the Works Committee's report that certain Australian wood laid in the Strand district in 1895 "has worn well, but that the late Strand District Board felt a definite approval of the wood could not be given until it had been tested for a sufficient period to show that it is as durable as the timber at present in use," the Ratepayers' Committee says: "The wood referred to as being 'at present in use' is deal, and is that of the favourite contractors, the Improved Wood Pavement Co. The first experimental order for red gum was given in Westminster without competition hardly a year ago. When the Works Committee of the Westminster City Council decide upon enormous paving contracts they find that one or two years' experience of an American wood (unknown in this country or the States) is sufficient to induce them to adopt it on a gigantic scale, whilst six or seven years' experience of Colonial woods (universally tried and adopted and recommended by the most eminent surveyors and engineers) does not warrant a single order."

Trade and Craft.

Tests with Slag Wool.

The pamphlet of "Notes on Non-Conductors of Heat" which has just been issued by Messrs. Frederick Jones & Co., of Perrin Street, Kentish Town, N.W., contains particulars of several useful tests with silicate cotton ("slag wool"), which is a pure mineral fibre blown from molten slag as it runs from the iron furnaces. As the result of four series of tests conducted in 1881, 1884, 1891 and 1894 by four different experts, it was found to be a much better non-conductor than hair-felt, papier-maché, sawdust, charcoal, asbestos and several other substances. Then again, Mr. Walter Jones, the well-known heating engineer of Stourbridge, has found that a 4in. pipe filled with hot water, and exposed to the outside air at 33 degs. Fahr., lost 90 degs. in 9¾ hours when covered with slag wool, whereas a similar pipe covered with sawdust lost the same number of degrees in a little over 8 hours, and an uncovered pipe in 2½ hours; that is to say, the last pipe cooled nearly four times as rapidly as that encased with silicate cotton. Its efficiency as an insulator for refrigerating chambers is proved by the following tests: A block of ice weighing 23lbs. was placed in a zinc box and encased with 2in. of silicate cotton, the average temperature of the room being 90 degs. Fahr. After 48 hours the ice was taken out and showed a loss of 12½lbs. Next, under similar conditions, a piece of ice weighing 26lbs. was encased with 6in. of charcoal, but after the same time it was found to have lost 18¼lbs., thus proving its inferiority as a non-conductor. Silicate cotton can be obtained loose, in wire-netted sheets (with or without a backing of galvanized iron), in strips, or in cloth form; but in case none of these are convenient to use, Messrs. Frederick Jones & Co. supply a cement consisting of fossil meal and other ingredients, with silicate cotton as the binding agent.

The Public Lighting of Liverpool.

Mr. C. R. Bellamy, the lighting engineer of Liverpool, has prepared a report in which he reviews the enormous improvements which have taken place in the lighting of the city during the last few years. In December, 1898, it was decided to apply the system of incandescent gas-lighting to the whole of Liverpool, the extension to be carried out at such a rate as the surplus funds at disposal would permit, which was estimated to occupy four years. The change, however, has been made in three years, leaving in the present year a surplus of £1,000 applicable to other street-lighting improvements. During the past six years the following work has been carried out in the Old City at a first cost of £32,956:—353 new lamps have been fixed in the Old streets; 928 passage lamps have been fixed, lighting the back entrances to 21,481 houses; 8,908 incandescent gas lamps have been fixed over 248 miles of road; and 152 electric arc-lamps have been erected over an area of 3¾ miles of road. There are 11,905 lamps in use in the Old City, with an aggregate illuminating value of 2,261½ millions of candles, at an annual cost for lighting and maintenance of £36,187 11s. 8d., the illuminating power being estimated as follows: 10-amp. electric arc lamps, 500 candles; incandescent gas, 40 candles per burner; and the ordinary flat flame at 16 candles. The year 1893 was the last in which the gas company had entire control, and the cost of the lighting for that year was £40,889 12s. 1d. On January 1st, 1894, the Corporation took over the lighting, &c., of the special lamps, and by the end of December the whole of the lighting of the city was in the hands of the Electric Power and Lighting Committee. The illuminating power of the lamps has been increased before midnight from 466¾ million candles to 1,576½ million candles, or nearly four times; after midnight, from 304½ million candles to 685 million candles, or more than double; whilst the total charges have fallen from £40,889 in 1893 to £39,587 in the present year (the last three months being an ample estimate), or a reduction of £1,302. There has been an increase in the lighting value of 5½ times to midnight, and three times from midnight to sunrise, which has been secured under an additional annual expenditure of £706, or 10 per cent. The public lighting throughout the Old City, inclusive of passage lighting and an average total increase in the aggregate lighting of over 200 per cent., is costing less than it did in 1893; which must be of considerable satisfaction to the Welsbach Incandescent Gas Light Co., Ltd., of Palmer Street and York Street, Westminster, the firm who installed the new lamps.

COMING EVENTS.

Wednesday, November 27.

Society of Arts.—Mr. J. Gordon Parker on "Leather for Bookbinding," 8 p.m.

Northern Architectural Association.—Council Meeting at 6.45 p.m. Mr. Henry S. Kerr on "Melrose Abbey," at 7.30 p.m.

City of London College Science Society.—Mr. E. R. Calthrop, M.I.M.E., on "Narrow Gauge Light Railways of Heavy Traffic Capacity," 7.30 p.m.

Thursday, November 28.

Society of Architects.—Presidential Address by Mr. Silvanus Trevail, F.R.I.B.A., 8 p.m.

Royal Academy.—Demonstration in Anatomy: The Lower Extremity. By Prof. Arthur Thomson, M.A., 4 p.m.

Institution of Electrical Engineers.—Meeting at 8 p.m.

Edinburgh Architectural Association.—Mr. Louis A. Barnier, B.A., on "The Old Monuments of Provence," 8 p.m.

Incorporated Institute of British Decorators (Northern District)—Mr. George C. Haité, R.I., R.B.A., on 'Decoration and Decorators, a Survey of the Past and Present," I., in the lecture room of the Young Men's Christian Association, Fargate, Sheffield, 7.30 p.m.

Society of Antiquaries of London.—Meeting at 8.30 p.m.

Friday, November 29.

Architectural Association.—Mr. A. Mitchell will read Mr. Francis Bond's paper on "Capitals," 7.30 p.m.

Saturday, November 30.

Dundee Institute of Architecture.—Mr. W. Page on "Notes on Art," 7 p.m.

Monday, December 2.

Royal Institute of British Architects.—Business Meeting. Election of Candidates for Membership. Mr. Lacy W. Ridge to move:—"That the R.I.B.A. desires to thank the Local Government Board for the issue of 'Model By-laws IV. (Rural Districts)' While doing so, it would urge on the Board the desirability of preparing a model to enable Rural District Councils to regulate party-walls as distinct from external walls, a matter for which the Urban Model By-laws, to which the Board refer them, are not available. The Institute ground this on the belief that the existence of properly-constructed party-walls has proved an efficient barrier to the spread of fire, and that it is undesirable that such protection should be withdrawn in places where it already existed." Mr. Herbert W. Wills to move:—"That in the interests of the profession it would be adviseable to have a list of 'Institute Assessors' drawn up, from whom the President would nominate, and that this list be from year to year revised." 8 p.m.

Society of Engineers.—Mr. H. Alfred Roechling, C.E., F.G.S., on "The Sewage Question during the last Century." 7.30 p.m.

Liverpool Architectural Society.—Mr. C. E. Bateman, F.R.I.B.A., on "Castle Bromwich Church," 6 p.m.

Royal Academy.—Demonstration in Anatomy: The Lower Extremity. By Prof. Arthur Thomson, M.A., 4 p.m.

Birmingham and District Clerks of Works' and Builders' Foremen's Association.—Mr. R. W. Newman, A.M.I.C.E., M.I.M.E., on "The Sanitary Engineering of Dwellings," 8 p.m.

Tuesday, December 3.

Architectural Association of Ireland.—Meeting at 7.45 p.m.

Land Law Reform Association.—Conference on Housing in Country and Town, 11 a.m. and 2 p.m.

Wednesday, December 4.

Ruskin Society of Birmingham.—The Rev. Professor H. C. Beeching on "Ruskin as a Man of Letters," 7.45 p.m.

Northern Architectural Association.—Students' Evening.

Society of Arts.—Mr. Herbert Stone on "The Identification of Wood and its Application to Scientific and Commercial Purposes," 8 p.m.

British Archæological Association.—Meeting at 8 p.m.

Edinburgh Architectural Association (Associates' Section).—Mr. John Ednie on "The Applied Art of To-day and Yesterday." 8 p.m.

Thursday, December 5.

Royal Academy.—Demonstration in Anatomy: The Head and Neck. By Prof. Arthur Thomson, M.A. 4 p.m.

Society of Arts (Indian Section).—Mr. Edward Penton, B.A., on "The Nushki-Seistan Route," 4.30 p.m.

Friday, December 6.

Architectural Association (Discussion Section).—Mr. Sydney Perks on "The Ethics of Dilapidations," 7.30 p.m.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
	BUILDING:		
Nov. 28	Sheffield—Stabling, &c., at Hospital	City Hospitals Committee	C. F. Wilke, City Surveyor, Town Hall, Sheffield.
„ 28	Rathmines—Workmen's Dwellings	Urban District Council	F. Beckett & Metcalf, 10 Leinster Street, Rathmines.
„ 28	Askam-in-Furness—Sunday Schools	Rev. W. Carr	Rev. W. Carr, Slater Terrace, Dalton-in-Furness.
„ 28	Consett—Fourteen Cottages	Consett Iron Co., Ltd.	C. E. Oliver, Company's Architect, General Offices, Consett.
„ 28	Kilkenny—Boundary Wall, &c.	Rural District Council	K. Comerford, Clerk, Kilkenny.
„ 28	Macclesfield—Improving School	Managers of Certified Industrial School	J. Wright, Architect, Macclesfield.
„ 28	Moss Side, Lancs—Bowl House, Shelters, &c.	Urban District Council	H. B. Longley, Engineer, Council Offices, Moss Side, Manchester.
„ 28	Ramsgate—Shelter Seat round Flag Staff	Corporation	Borough Surveyor, Albion House, Ramsgate.
„ 28	Wanstead, Essex—Wooden Room on Brick Substructure	Urban District Council	C. H. Bressey, Surveyor, Council Offices, Wanstead, N.E.
„ 28	Bradford—Firebricks, Retorts, &c.	Corporation	Gas Office, Town Hall, Bradford.
„ 28	Macclesfield—Improving Industrial School	Managers	J. Wright, Architect, Macclesfield.
„ 29	Ross Links, near Bamburgh—Coastguard Buildings	Admiralty	Director, Works Dept., Admiralty, Northumberland Avenue, W.C.
„ 29	Warrington—Cement Bricks &c	Cheshire Lines Committee	S. S. Barton, Storekeeper, Cheshire Lines, Warrington.
„ 29	Halifax—Alterations, &c., to Bakery	Industrial Society	M. Hall, 29 Northgate, Halifax.
„ 29	Hereford—Two Cottages	—	Nicholson & Hartree, Architects, Hereford.
„ 30	Whitby—Alterations, &c., to Property	Co-operative Society	J. J. Milligan, Architect, Baxtergate, Whitby.
„ 30	Trelewis, Wales—Thirteen Houses and Two Shops	Building Club	T. Roderick, Architect, Ashbrook House, Clifton Street Aberdare.
„ 30	Sheffield—Fireclay Goods	United Gaslight Company	J. W. Morrison, Offices, Commercial Street, Sheffield.
„ 30	Aberkenfig, Wales—Four Houses	Mrs E. J. Pugh	Prince of Wales Hotel, Aberkenfig.
„ 30	Worcester—Two Pairs of Cottages	Lunatic Asylum Committee	H. Rowe & Son, Architects, Worcester Chambers, Pierpoint Street, Worcester.
„ 30	Clinch Green, Bexhill—Cemetery Chapel	Urban District Council	W. H. Alton, Architect, Devonshire Chambers, Bexhill.
„ 30	Halifax—Infants' School	School Board	C. F. L. Horsfall & Son, Architects, Lord Street Chambers, Halifax.
„ 30	Egremont, Cumberland—Schools	School Board	J. S. Moffatt, 53 Church Street, Whitehaven.
„ 30	Ripponden, near Halifax—Liberal Club and Hall	—	W. O. Williams, 29 Southgate, Halifax.
„ 30	Illogan, Cornwall—Girls' School	School Board	S. Hill, Architect. Green Lane, Redruth.
„ 30	Windermere—Residence	J. Mudd	R. Walker, Architect, Windermere.
„ 30	Hornsey, N.—Pulling Down & Clearing Site of Priory	—	J. Farrer, 2 Colman Street, E.C.
Dec. 2	Belfast—Assembly Buildings	General Assembly of Presbyterian Church	W. H. Stephens & Son, Donegall Square Buildings, Belfast.
„ 2	Cardiff—Additions to Warehouses	J. Isaac & Sons	E. G. C. Down, 31 High Street, Cardiff.
„ 2	Farnborough, Hants—Residence and Stabling	—	W. E. Trevena, Ridgemount, Southampton Rd., Farnborough Hants.
„ 2	Aylsham, Norfolk—Converting Dormitories into Sick Wards.	Board of Guardians	J. B. Pearce, 15 Upper King Street, Norwich.
„ 2	Dungeness, Kent—Lighthouse, Fog-Signal House, &c.	Corporation of Trinity House	E. G. Verity, 7 Great Marlborough Street W.
„ 2	Church Hill, Brownhills—Alterations, &c., to Schools	Norton-under-Cannock U D. Sch. Bd.	T. H. Fleeming, 102 Darlington Street, Wolverhampton.
„ 2	Ballywater, Ireland—New Gothenburg Inn	Right Hon. Baron Dunleath	W. J. Fennell, 2 Wellington Place, Belfast.
„ 2	Glasgow—Hospital	Parish Council	J. Baxter, 243 St. Vincent Street, Glasgow.
„ 2	Lower Garndiffaith, near Pontypool—School	Trevethin School Board	Lansdowne & Griggs, Architects, Newport, Mon.
„ 2	Quaker's Yard, Glamorgan—Nineteen Cottages	Windsor Building Club	W. Dowdeswell, Architect, John Street, Treharris.
„ 2	Bandon—Pair of Semi-detached Villas	E. H. Harte	W. H. Hill & Son, 28 South Mall, Cork.
„ 2	Fermoy—Villa Residence	Major Young	W. H. Hill & Son, 28 South Mall, Cork.
„ 2	Ilfracombe—Pulling Down and Rebuilding Inn	S. W. Arnold & Sons, Ltd.	Smyth-Richards & Fox, 3 Castle Street, Barnstaple.
„ 2	Sheffield—Terracing near Cricket Pavilion	United Cricket and Football Club, Ltd.	J. Nicholson, Secretary, Pavilion, Bramall Lane Ground, Sheffield.
„ 3	Skerton, Lancaster—Infant School and Additions	Lancaster School Board	Wright & Son, Surveyors, Lancaster.
„ 3	Leytonstone—Extending Buildings at Electric Lighting Works.	Urban District Council	W. Dawson, Borough Engineer, Town Hall, Leyton.
„ 3	Dublin—Bricks, Tiles, Cement, &c.	Midland Great Western Rly. Co. (Ireland)	R. L. Badham, Secretary, Broadstone Station, Dublin.
„ 3	Filton—Station Buildings	Great Western Railway Company	Engineer, Bristol Station.
„ 3	Bromley—Addition to Asylum Laundry	Managers	J. & S. F. Clarkson, 136 High Street, Poplar, E.
„ 3	Dartford—Refuse-Destructor	Urban District Council	J. C. Hayward, Clerk, Sessions House, Dartford.
„ 4	Leamington—Additions, &c, to Pump Room Baths	Corporation	Borough Engineer, Town Hall, Leamington.
„ 4	Sunderland—Cement Retaining-Wall	Corporation	Borough Engineer, Town Hall, Sunderland.
„ 4	Southampton—Alterations, &c., to Ordnance Survey Offices.	Commissioners of H.M. Works, &c.	Secretary, H.M. Office of Works, &c., Storey's Gate, S.W.
„ 5	Warwick—Infirmary (151 Inmates and Staff)	Union Guardians	F. P. Trepass, 8 Jury Street, Warwick.
„ 5	London, W.—Block of Offices, Stabling and Tenements	Wilts United Dairies, Ltd.	Pilditch, Chadwick, & Co., 2 Pall Mall East, Charing Cross, W.C.
„ 5	Cardiff—Jobbing Works	Corporation	C. H. Priestley, Waterworks Engineer, Town Hall, Cardiff.
„ 6	Dublin—Cement, Barrows and Trucks, Ladders, &c.	Commissioners of Irish Lights	O. Armstrong, Secretary, Irish Lights Office, D'Olier Street, Dublin.
„ 6	Croydon—Extension to Polytechnics	Town Council	Deputy Borough Engineer, Town Hall, Croydon.
„ 7	Blaenavon, Mon.—Sliding Partitions, &c., at Schools (Two Contracts).	School Board	Lansdowne & Griggs, Architects, Metropolitan Bank Chambers, Newport, Mon.
„ 9	Bodringallt, Wales—Schools	Ystradyfodwg School Board	J. Rees, Architect, Hillside Cottage, Pentre.
„ 9	Middlesbrough—County Court	Commissioners of H.M. Works	Secretary, H.M. Office of Works, Storey's Gate, S.W.
„ 9	Wolverhampton—Ice Factory and Cold Stores	Markets Committee	G. Green, Borough Engineer, Town Hall, Wolverhampton.
„ 9	Wolverhampton—Alterations, &c., to Town Hall	Council	F. T. Book, Architect, Weelfoun Chambers, Darlington Street, Wolverhampton.
„ 9	Erith—Engine and Boiler House, Chimney Shaft, &c.	Urban District Council	W. Egerton, 12 Queen's Road, Erith.
„ 10	Conisborough—Isolation Hospital	Doncaster and Mexborough Joint Hospital Board.	J. H. Morton, 50 King Street, South Shields.
„ 10	Kirkcross and Brigham—Lime Quarry Working	—	Allerdale Coal Co, Ltd., Workington.
No date.	Watford—Boys' Department at School	School Board	J. Hunt, 40 Upper Baker Street, N.W.
„	Broadstairs—House	—	W. H. Woodrofe, 32 High Street, Southwark, S.E.
„	Derby—Brick and Stone Church	Mrs. Francis Ley	E. R. Ridgway, Architect, Long Eaton.
	ENGINEERING:		
Nov. 28	East Barnet—Bridge	Urban District Council	H. York, Surveyor, Station Road, New Barnet.
„ 28	Nelson, Lancs—Reservoir (160 million Gallons)	Corporation	J. Newton, Son & Bayley, 17 Cooper Street, Manchester.
„ 28	St. Ninian's, Stirlingshire—Reservoir	—	Crouch & Hogg, 53 Bothwell Street, Glasgow.
„ 28	London, E.C.—Two Bogie Wagons and nine Carriages	Nizam's Guaranteed State Rlys. Co., Ltd.	Secretary, 50 Old Broad Street, E.C.
„ 28	Hull—Six Rotary Transformers	Electric Lighting Committee	T. G. Milner, Town Hall, Hull.
„ 28	Ashton-in-Makerfield, Lancs—Extension of Gasworks	Urban District Council	A. Sykes, Clerk, Council Offices, Bryan Street, Ashton-in-Makerfield.
„ 29	Celbridge, Ireland—Pump Well	Rural District Council	F. Shortt, Clerk, Celbridge.
„ 30	Kirkcaldy—Tramway Rolling-stock	Corporation	Kennedy & Jenkin, 17 Victoria Street, Westminster, S.W.
„ 30	Cleckheaton, Yorks—Electrical Plant	Urban District Council	Clerk to Council, Town Hall, Cleckheaton.
„ 30	Clitheroe, Lancs—Sewage Settling Tanks, &c.	Corporation	A. R. Bleavard, Borough Surveyor, Church Street, Clitheroe.
„ 30	Buxton—Retaining Walls, Steel & Concrete Covoring	Urban District Council	Gas Engineer, Town Hall, Buxton.
Dec. 2	Tripcock Point, Plumstead, Kent—Steel Light-house	Corporation of Trinity House	C. A. Kent, Secretary, Trinity House, London, E.C.
„ 2	London, S.E.—Steam Boilers, &c., at Public Baths, &c.	Camberwell Borough Council	W. Oxtoby, Borough Engineer, Town Hall, Camberwell, S.E.
„ 2	Dungeness, Kent—Lighthouse, Fog-Signal House, &c.	Corporation of Trinity House	E. G. Verity, 7 Great Marlborough Street, W.
„ 2	Exeter—Crane	City Council	City Engineer, 18 Bedford Circus, Exeter.
„ 2	Plumstead, Kent—Steel Lighthouse	Corporation of Trinity House	C. A. Kent, Secretary, Trinity House, London, E.C.
„ 2	Dewsbury—Dynamos	Corporation	R. H. Campion, Borough Electrical Engineer, Dewsbury.
„ 3	Dartford—Refuse-Destructor	Urban District Council	J. C. Hayward, Clerk, Sessions House, Dartford.
„ 3	London, E.C.—Artesian Well at Baths	Shoreditch Borough Council	H. M. Robinson, Town Clerk, Old Street, E.C.
„ 4	Manchester—Boilers, Economisers, Feed Pumps, &c.	Electricity Committee	F. E. Hughes, Secretary, Electricity Dept., Town Hall, Manchester.
„ 5	Warwick—Steam, Cooking, &c., Apparatus & Fittings	Union Guardians	F. P. Trespass, 8 Jury Street, Warwick.
„ 6	Hull—Construction of New Dock (50 acres)	Joint Dock Committee	Sir J. Wolfe Barry & Partners, 21 Delahay Street, Westminster.
„ 6	Croydon—Heating Polytechnics	—	Deputy Borough Engineer, Town Hall, Croydon.
„ 9	London, W.C.—Light Radiators	School Board	Contracts Sub-Dept., School Board Offices, Victoria Embankment.
	IRON AND STEEL:		
Nov. 28	Glasgow—Cast-iron and Steelwork, &c., to Warehouses	Corporation	Thomson & Sandilands, 241 West George Street, Glasgow.
„ 28	Sheffield—Ironfounder's Work at Hospital	Corporation	C. F. Wike, City Surveyor, Town Hall, Sheffield.
„ 29	Warrington—Nails, Screws, Bolts, Fishplates, &c.	Cheshire Lines Committee	S. S. Barton, Storekeeper, Cheshire Lines, Warrington.
„ 30	Carlisle—870 lineal yds. of Fencing, Gates, &c., at Cattle Market.	Corporation	H. C. Marks, 36 Fisher Street, Carlisle.
„ 30	Swansea—Iron Castings, Ironmongery, &c.	Harbour Trustees	Engineer, Harbour Office, Swansea.
„ 30	Pencoed, Wales—Lamp-pillars, &c.	Parish Council	W. H. Mainwaring, Clerk, Llwynon, Pencoed.
„ 30	Dundalk—Ironmongery, &c.	Commissioners of Public Works	Office of Public Works, Dublin.
Dec. 2	Margate—Pipes, Tubes, Fittings, &c.	Corporation	F. Stanley, Manager, Waterworks Office, Municipal Buildings, Market Place, Margate.
„ 2	Leeds—Boundary Wall with W.I. Palisading	Union Guardians	J. M. Bottomley, 13 Bond Street, Leeds.
„ 2	Dublin—Iron, &c.	Grand Canal Co.	G. Tough, General Manager, James's Street Harbour, Dublin.

COMPLETE LIST OF CONTRACTS OPEN—*continued.*

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
	IRON AND STEEL—*cont.*:		
Dec. 3	London—Steel Bridge Girders, &c.	Great Western Railway	Engineer, Paddington Station, London.
" 3	London, E C.—Stores	South Indian Railway Co., Ltd.	Secretary, 56 Gracechurch Street, E C.
" 3	Dublin—Bolts, Rivets, Iron Castings, &c.	Midland Great Western Ry. Co. (Ireland)	R. L. Badham Secretary, Broadstone Station, Dublin.
" 4	Dublin—Iron Castings, Boiler Tubes, &c.	City of Dublin Steam Packet Co.	Secretary, 15 Eden Quay, Dublin
" 4	London, E.C.—Tools and Stores	East Indian Railway Co.	C. W. Young, Secretary, Nicholas Lane, E.C.
" 5	Cardiff—Cast-iron Street Surface Covers, &c.	Corporation	C. H. Priestley, Waterworks Engineer, Town Hall, Cardiff.
" 6	Dublin—Iron Stores, &c.	Commissioners of Irish Lights	O. Armstrong, Secretary, Irish Lights Office, D'Olier St., Dublin.
No date.	Rustington, Worthing—Supply and Erection of Cast Iron Tank (10,000gals)	T. Summers	T. Summers, Broadmark Estate, Rustington, Worthing.
	PAINTING AND PLUMBING:		
Nov. 28	Rathmines—Plumbing to Workmen's Dwellings, &c.	Urban District Council	Beckett & Metcalf, 10 Leinster Street, Rathmines.
" 28	Sheffield—Plumber, Painter and Glazier Work at Hospital.	City Hospitals Committee	C. F. Wike, City Surveyor, Town Hall, Sheffield.
" 28	Glasgow—Plumber & Painter Work and Gas Fittings at Warehouses, &c.	Corporation	Thomson & Sandilands, 241 West George Street, Glasgow.
" 28	Greenock—Oils, Paints, &c.	Harbour Trustees	Engineer, Municipal Buildings, Greenock.
" 29	Warrington—White Lead, Oils, Lead Piping & Sheet, Brushes, &c.	Cheshire Lines Committee	S. S. Barton, Storekeeper, Cheshire Lines, Warrington.
" 30	Swansea—Oils, &c.	Harbour Trustees	Engineer, Harbour Office, Swansea.
Dec. 2	Dublin—Paints, Varnish, White and Red Lead, &c.	Grand Canal Co.	G. Tough, General Manager, James's Street Harbour, Dublin.

An Architectural Causerie.

An Opportunity for Makers. WHEN the China war was ended the boom given to manufactures in Japan was disproportionate to the available capital, and consequently there followed an inevitable depression. Happily, however, matters are now much improved; business is reviving on a far sounder basis, and the outlook is most hopeful. There is thus every expectation that the industrial exhibition to be held at Osaka in 1903 will be a great success. The point to be noted about this exhibition is that although it has hitherto been exclusively Japanese, held once every five years in different centres, it has been decided to include in the exhibition of 1903 a display of European and American manufactures and machinery, and Mr. Kanzaki, the Special Commissioner of the Japanese Government, is at present in London negotiating, among other matters, for the motive power and for a cold-storage installation. No charges will be made for space or for power, and goods for exhibition will be admitted duty free. Every inducement is thus offered to manufacturers; and when it is recollected how municipal water-supply and sanitation are now being carried out in Japan, and what extensions are being made in engineering and manufactures generally, it is to be hoped that our makers will take advantage of the opportunity, especially when the Commissioner himself states that, *cœteris paribus*, preference is almost invariably given to British manufacturers. Mr. Kanzaki can be addressed care of the "British Trade Journal," 24, Mark Lane, E.C.

The American Building. IT seems to be our nemesis to be overrun with Americans; and though, at the time when the much-vaunted architectural scheme of the London County Council was all afire, the idea of an English-American syndicate taking the whole matter in hand would have been considered incredulous and impossible, yet at the moment it is established fact. We know for certain that an application by the syndicate for the Strand site has been received at Spring Gardens, and that in due course it will be considered by the proper committee; but there seems every indication that the rough sketches published in the daily press are merely suggestive of the kind of building proposed. From the plan we note that, though the new Gaiety Theatre and Short's Restaurant are shown separated by a wide road or passage from the proposed office building, no such separation is provided at the opposite end of the island site; the result being that there is a total lack of balance, an effect which would only be aggravated by the difference in style between Mr. Runtz's building and the syndicate's great block. A passage-way with steps leading to the new crescent was shown in all the eight designs exhibited in October, 1900, at the Water-Colour Society's gallery, but they were provided at each side—an absolutely essential requirement. With regard to the English-American proposal itself, there is no reason why a most admirable building should not be built from American designs, but the Council should insist on the provision of a passage-way at each side, otherwise, no matter how good or bad the building may be, the effect will be utterly marred by the one-sidedness of the whole scheme.

City Architects. THE proposal to appoint a city architect for Manchester, which was referred to by Mr. Edward Salomons at the recent annual dinner of the Manchester Society of Architects, is not favourable in the eyes of the Lord Mayor; and as the matter is one which must necessarily concern many growing cities it is opportune to note the two standpoints adopted. Those who support the suggestion, knowing what has been perpetrated in the name of architecture by borough engineers and surveyors masquerading as architects, hold the opinion that a city like Manchester, with its constant needs for new civic buildings of one kind or another, demands the appointment of a capable man whose position will enable him to keep a progressive watch over the architecture of the city and design new buildings so that they shall form a coherent whole and not be disjointed units set among incongruous surroundings. On the other hand, the main contention of those represented by the Lord Mayor of Manchester seems to be that if a city architect is appointed the chances are that all new public buildings will drift into his hands, with the result that everything will be of one stamp, and consequently monotonous; and thus by easy stages we arrive at the plea for open competition. We cannot agree with the Lord Mayor's contention. Of course it all depends on the architect selected. If he is of the same calibre as one or two well-known theatre architects whose work seems eminently marketable, the result must be disastrous; but there is no reason to suppose that a capable architect will kill a city with monotony. Everyone must work according to his own particular views, favouring some features and abandoning others. Robert Adam built after one manner, but we should not term his work monotonous on that account, any more than we should find fault with Mr. Norman Shaw for adopting the same treatment in the White Star Offices at Liverpool as that which characterizes New Scotland Yard. Moreover, if there is one thing needed more than another in our towns and cities it is more harmony among the buildings, a defect which can only be aggravated when new additions are made by strangers ignorant of local needs and unfettered in their choice of treatment. The bizarre is to be seen on every side, and the medley of a Piccadilly Circus has its counterparts throughout the land. It is true that the presence of a single controlling hand might be too strongly felt and a city become one endless building, yet, whatever the demerits of his scheme, Haussmann made Paris what it is, and the genius of L'Enfant was largely responsible for the magnificent effects of Washington to-day: and in our own country there is the work of the Woods at Bath. So that we think the appointment of capable city architects is most desirable in every respect, but it should never be forgotten that no man can do good work when he is harassed and hurried; and when an architect has responsibilities forced on him which might well be delegated to others, when he finds himself so occupied with valuations and estimates that he has little time to think of architecture, he is not to be expected to produce his best work, though, unfortunately, many people seem to lose sight of this aspect of the question.

THE EMPIRE HOTEL, LOWESTOFT. H. L. FLORENCE AND L. H. ISAACS, FF.R.I.B.A., ARCHITECTS.

Too Generous. WE have before us the terms offered by the Birkdale Urban District Council for revising the existing plans and specifications of their cemetery chapel and lodge, superintending the work, and taking out the quantities. The cost of the chapel is not to exceed £1,200, nor the lodge £600—which makes a total of £1,800—and for all this work architects are offered a remuneration of £80, which is less than 5 per cent.; and, moreover, they are required to give a guarantee that the tenders will not exceed the amounts stated! So, all who seek such an architectural Eldorado, send ye in an application accompanied by a pencil sketch not later than December 21st: but beware the guarantee.

THE "DAVY HALL" RESTAURANT, YORK.

THE "Davy Hall" Restaurant (Messrs. Penty & Penty, architects) is situated in Davygate, York, upon a site adjacent to that formerly occupied by a building known as the "Davy Hall." Leaving the plan to show the general arrangement of rooms, it may be mentioned that the corridor by which the restaurant is approached from the street is lined at the sides with salt-glazed bricks 2½in. thick, having plinth and other dressings of local sandstone. The ceiling is groined in concrete and finished with plaster. Owing to the fact that the site is surrounded by high buildings and the necessity of keeping the dining hall and restaurant as large as possible, top lighting has been mainly utilized. The dining hall and restaurant are treated with broad effects of restful colour laid on in masses. At one end of the dining hall is a large semicircular window filled in with stained glass by Messrs. G. F. Gascoyne & Son, of Nottingham, the subject representing the knights of King Arthur's Court outside Camelot. This idea is continued in the decorative work round the wall, the stencilling on the frieze—rose and crown—being emblematic of king and country, and this, together with the stencilling in the restaurant, has been executed from the full-size cartoon of the architects. At the opposite end of the dining hall is the minstrels' gallery, with a staircase leading to it. In the framing over the fireplace underneath this gallery is a modelled figure representing King Arthur, by Mr. G. Milburn, of York, who has executed the whole of the carving in the building. Special mention should also be made of the metal work, electric light fittings and fire-grates, which are by the Bromsgrove Guild of Applied Arts.

BRICKLAYING AND TRADE-UNIONISM.

FURTHER COMMENT.

THE indictment against the building trades has passed unchallenged—simply because it is incontrovertible. There is nothing new to add to the charge, but the following additional particulars amplify and confirm the statements published in our last issue:—

The Effect of a Standard Wage.

A working joiner in the North of England thus relates (in a letter to the "Times") his experiences in the building trade:—In the first place I enter a shop as improver and am supposed to know nothing, or a little less, to start with, and after a few hours I am politely told that I must join the union or decamp. I object to certain clauses as to a standard rate of wages and other details, but, nevertheless, I am either to accept the situation or seek a "fresh shop." Circumstances are against me; I am compelled to accept the inevitable. Time passes on and a master gives me sixty doors to frame and panel; my mate on the next bench has a similar number; the amount of labour involved, the style and size are equal. Mine are sent down to the store-room at the rate of 2s. per door, while my neighbour's are costing 4s. per door. Now this is the signal for a general boycott for me. I hold to my post, and eventually I rise to take the highest post possible in the same shop, that of staircase building and handrailing, and now things assume a different aspect altogether. I am told by my shopmates that I am a fool for studying and persevering in my pursuit of knowledge, and more particularly so since that for this advanced and arduous labour (in our part) I can demand not ½d. per hour above the standard rate of wages, and the man who cannot manage even to make an ordinary frame and sash can demand the same. Now, I ask, where is there any incentive to advancement? To what purpose should I think or study for the benefit achieved? I must confess that to a man whose mind is dull and unfertilized there is none. And this cry is heard up and down the land.

Mr. William Emerson.

Mr. William Emerson, P.R.I.B.A., says:—No man can pervert and bastardize the powers and energy with which he has been endowed by working in a way which "sacrifices time, talent, labour, honour, principle and love at the altar of mammon," as seems to be encouraged by the trade-unions, without the worst moral deterioration; and as this principle appears to govern not only the building trade but most, if not all, other branches of British labour, it must affect the bulk of the working masses—in other words, the bulk of the British nation is being demoralized by means of an organised system.

The Significant Silence of the Trade-Unions.

Mr. Collison, general secretary of the National Free Labour Association, pertinently remarks in a letter to the "Times" that "although it is more than a week ago since the publication of the first article . . . . yet none of the trade-union leaders have had the courage to reply." He continues:—The restriction of work by every section of the building trade is notorious. A labourer must not "block" more than ten bricks in his hod to carry to the bricklayer—if it is ladder or scaffold work. If the bricklayer lays more bricks than the shop-delegate thinks necessary he must "stop it" or the job is "struck" and the works picketed. When the employer or travelling foreman visits a job a great show of industry is made by every branch of labour. The clink of the trowel can be heard a hundred yards off, whilst the labourers are very industriously climbing the ladders, blocking the scaffold with bricks and mortar. The talismanic word has gone around the job by the look-out delegate. It is known by the shout, "Sail-ho." When this gentleman leaves the works, the password is "Spell-ho," and the men resume their normal slow style of working. These are unwritten laws.

The Council's Bricklayers.

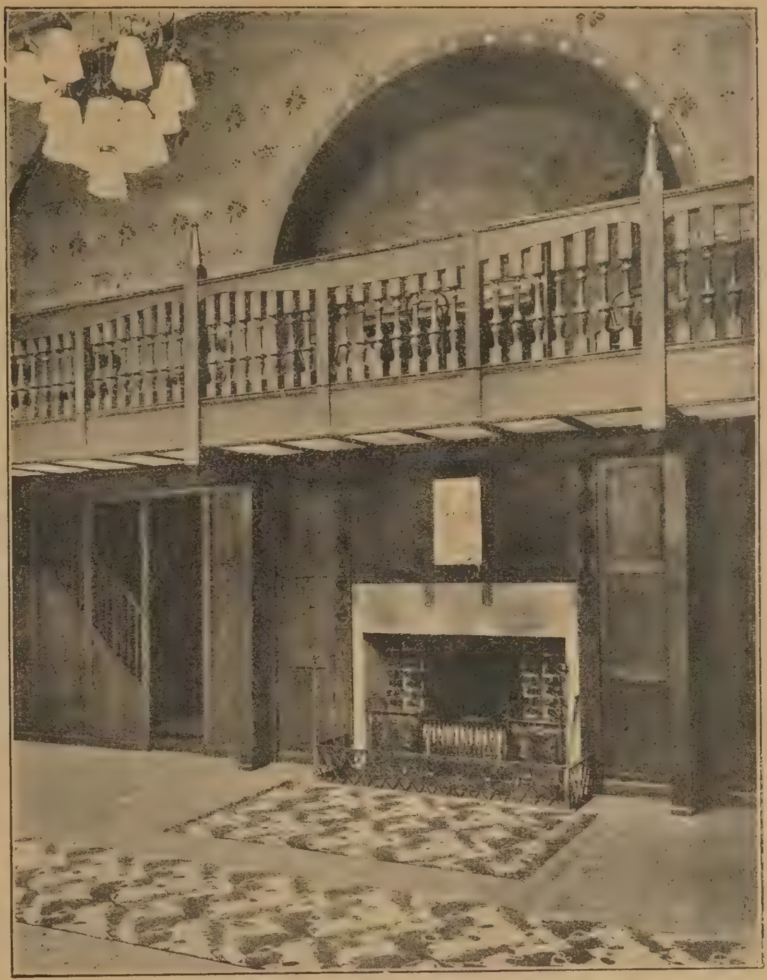
At last week's meeting of the London County Council Captain Swinton asked if the chairman of the Finance Committee had any further information to give with respect to the amount of work done by the bricklayers in the Council's employment. Lord Welby said the Works Sub-Committee had continued their enquiries, and the result confirmed the general impression that the bricklayers had done less work in recent years, but that of late an improvement had taken place. But he must add that the circumstances varied considerably in the various cases before them, and it was impossible for them at the present moment to state in any specific form what the production had been and what had been the increase of late. The Sub-Committee were still pursuing their enquiries, and would presently bring up a report. There was, however, one point which he must now notice. The "Times" correspondent stated that laying 330 bricks per day was considered a fair day's work for the London County Council. It need

THE "DAVY HALL" RESTAURANT, YORK. PENTY AND PENTY, ARCHITECTS.

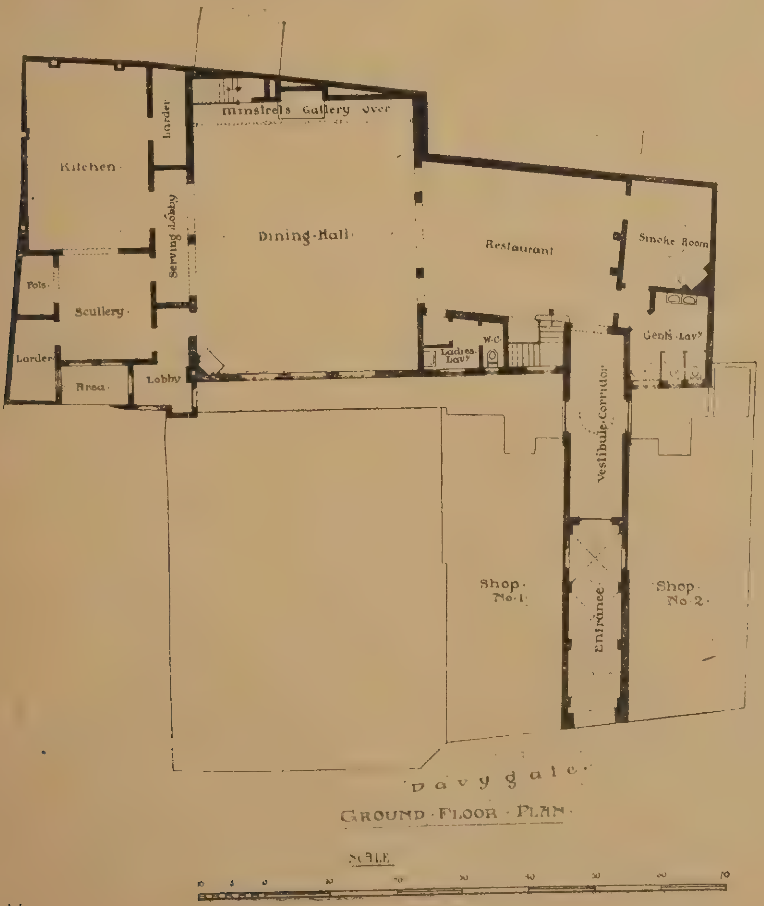
hardly be said that the Sub-Committee had never given any encouragement of any sort or kind to such a limit. The Council desired to be a model employer and to give wages which should be in accordance with those given by the best of employers; but if they gave good pay there must be some reciprocity. A good rate of pay must be rewarded by a good rate of work, and to secure that end the Works Sub-Committee would give an unwavering support to the works manager. Captain Swinton enquired whether the Sub-Committee's report would deal with other branches of labour besides bricklaying. Lord Welby said they would consider that question. Subsequently, on a report of the Fire Brigade Committee, Mr. Dobson remarked that the estimated cost of building a wall at the back of the East Greenwich Fire Station was put down at £500. He hoped that now the policy of "go easy" had been repudiated on behalf of the Works Department, and the noble lord having stated that the future policy was to be one of reciprocity, the manager of the department would insist on the latter policy being carried out by the dismissal of those men who would not give fair value for their wages. Members had denied that there was any such understanding amongst workmen as to the limitation of their production, but he could prove that it was well known all over Great Britain.

Mr. Ralph Neville Denounces the Wage System.

Mr. Ralph Neville, K.C., says:—It is hardly too much to say that work in England to-day is about as bad as an energetic, capable, and fairly honest race can make it; and it cannot be well denied that trade-unionism is, to a great extent, responsible for this unhappy state of affairs. Nevertheless it is useless to inveigh against trade-unionism. No thinking man nowadays denies the necessity of combination for the protection of labour. The British workman is what the conditions of his work have made him; you can change the man by changing the conditions, but in no other way. Exhortation and invective are popular remedies; they are certainly cheap and easy, but their effect is negligible. Give the working man sufficient interest in what he helps to produce, to make him feel that his prosperity depends upon his individual effort, and he will be speedily transformed. The perpetuation of the wage system, with the accompanying combination, as the be-all and end-all of the working man's existence means the perpetuation of improvidence, thriftlessness and inefficiency among the working class.



THE "DAVY HALL" RESTAURANT, YORK: FIREPLACE AND MINSTRELS' GALLERY IN DINING HALL. PENTY AND PENTY, ARCHITECTS.



CARPENTERS' COMPANY EXAMINATION.

THE Carpenters' Company held their annual examination in sanitary building construction recently. The preliminary course of lectures was delivered again this year with a view to helping candidates who enter to try to obtain the Company's certificate. Candidates came from distant towns, such as Nottingham, Worcester, Tunbridge Wells, &c. The board of examiners included Professors T. Roger Smith and Henry Robinson, Mr. John Slater, B.A., Mr. W. H. Seth-Smith, president of the Architectural Association, Mr. Wynter Blyth, M.O.H., Marylebone, and others. We give below the list of successful candidates, arranged in order of merit:—

1. F. Hartnoll. Special prize of books, as he has already gained the silver medal.
2. H. Barsby } Equal. Silver medal.
3. H. German }
4. G. H. Lovegrove }
5. E. W. F. Martin } Equal. Bronze medal.
6. A. Norton }
7. H. Walker }
8. H. Bolton } Equal. }
9. J. Sandham } }
10. C. W. Woodhouse } } Certificates.
11. A. B. Harvey }
12. E. A. Crane }
13. G. J. Boog }
14. J. Lawrence }
15. W. M. Couper

Architectural Association.—Owing to Mr. Francis Bond's illness, Mr. Arnold Mitchell delivered the lecture on "Capitals" before the Architectural Association on Friday evening last. Numerous lantern views were thrown on the screen in illustration of his remarks, which were given extempore.

SOCIETY OF ARCHITECTS.

MR. TREVAIL'S ADDRESS.

THE first ordinary general meeting of the Society of Architects for the session 1901–2 was held on Thursday last at St. James's Hall, Piccadilly, W., the chair being occupied by the newly-elected president, Mr. Silvanus Trevail, F.R.I.B.A., J.P. After the minutes of the last meeting had been read and confirmed, the following candidates were elected Members of the Society:—W. L. Trant Brown (London, S.W.), W. J. Dunham (Norwich), S. Arnold Kelly (Shanghai), P. S. Parris (Crowborough), H. D. Pitts (Cape Town), E. J. Sadgrove (London, W.C.), C. Simpson (Leigh), J. A. Soutter (London, E.C.) and M. Stirling (Madras). Messrs. S. C. Baggott (West Bromwich), M. B. Collins (Redruth), T. J. Edward (Ludlow) and W. C. Watkins (Southampton) were elected Students.

THE "DAVY HALL" RESTAURANT, YORK: ENTRANCE CORRIDOR.

The auditors' report for the year ending October 31st last was then read: the balance-sheet shows a balance of £350 3s. 9d. from the last account and £312 16s. 4d. from the Revenue Account.

Mr. Trevail then delivered his presidential address. After referring to architectural registration, ancient lights, the R.I.B.A. and the Architectural Association, the president spoke of the abuses of the term "architect" that come under the observation of country practitioners. He said:—

Plagiarism.

I regret to say that the local district surveyor's office in small provincial towns is frequently made the medium for plagiarism of the most impudent description. Plans and sections of new buildings have to be deposited in accordance with the provisions of the local by-laws. The local council, acting upon the recommendation of their surveyor, issue a notice that these must be in duplicate, one set to be retained by the authority and the other for stamping and return. But latterly elevations as well as plans and sections have been required, with the result that complete sets of drawings, minus the details, are in the archives of the surveyor and his batch of assistants, so that they have a complete record of all the work done in that particular town or district.

Soon we see the effect. Mr. A. builds a residence in the locality from designs furnished by a London or other distant architect of recognized standing. Afterwards Mr. B. wants a house. He likes Mr. A.'s style. When it is known locally that Mr. B. is about to build, he is visited by either the local surveyor or some member of his staff with the plausible intimation that if Mr. B. wants a residence like Mr. A.'s everything can can be done for him in the "office" much more expeditiously and better than can be the case from a distance, at a cheaper rate, and with the certainty of the plans passing the authority without revision or delay! Of course, the result is that the surveyor or his assistant gets the instruction to proceed. Such a state of things exists to an extraordinary extent in our smaller towns, and scarcely a week passes but complaint comes from one architect or another of abuses of this sort.

All local surveyors and their assistants should, as a condition of their appointment, be debarred from practising as "architects"; at any rate within the areas over which they have adjudicatory powers.

But the class I have mentioned have some knowledge of architectural work, and certainly of drainage and sanitary matters; so they have possibly more excuse for "dabbling" than Board-school masters, builders' clerks, auctioneers, land agents, general contractors, clerks of works, boys from the nearest art school, photographers, highway surveyors, and in one instance a marine store dealer—all of whom, to my knowledge, have signed themselves "architects," submitted plans to local authorities, and otherwise acted as professional advisers to their clients.

Registration: The Illinois Precedent.

(Here the president dealt at length with architectural registration, citing the case of Illinois, of which Professor Clifford Ricker, president of the State Board of Examiners, said: "The general results of the law (registration) have been decidedly advantageous to the public as well as to the profession. The professional education and training necessary to the successful practice of architecture has very materially increased during the existence of the law. Nearly one-sixth of the number of architects licensed without examination have been replaced by men who passed the examinations now required. Since this change has occurred within three-and-a-half years, it may reasonably be expected that all incompetent men will have left the profession at the end of the next ten years, when all practising architects will either have passed the examinations or possess equal preparation for their work. The professional standing of the architect should then, in Illinois, equal that of the lawyer or the physician.")

A Proposal in regard to Ancient Lights.

Mr. Trevail next spoke of ancient lights, stating that what was wanted was "a preliminary court of appeal in each locality, where plans can be deposited when any improvement is contemplated likely at all to affect others. Those who may adjoin should have notice of what was intended and the full right of inspection of plans, and the pros and cons should then be gone into fully; and if, in the opinion of the Court, damage was likely to be sustained, they might say so with or without assessing it, as might be agreed to on both sides, but at any rate to have the power of giving a permit for proceeding with the work if the damage in their opinion was not such as to materially affect the user of the complainant's premises, when the subject of actual damage sustained could be subsequently ascertained by arbitration or in the law court in the usual way. This at least would release properties from the state of absolute block that many are in to-day."

Five per Cent.

Continuing, Mr. Trevail said:—Not long ago a gentleman, who as a member of many building committees has had a great deal to do with different architects, told me that he was astonished to find such a great variation as existed among architects as to what services should be rendered for the ordinary commission of 5 per cent. He remarked that if there was a clear and definite statement upon the matter it would be of great advantage to the profession as well as to the public. Now, I take it that we as a body do not want to be told what is included in our ordinary fee of 5 per cent.; but as there are others outside who would like to know, and seeing that anything that will conduce to uniformity of practice is a distinct advantage I will take upon myself to define the duties concisely as follows as coming within the ordinary commission:—(1) Reasonable preliminary sketches in pencil, revised until the wishes of the client are exactly ascertained. (2) Approximate estimate of cost, such as may be obtained by cubing. (3) Preparation of a full set of ⅛in. scale drawings complete in all respects, with one traced copy of the same for the builder's use in carrying out the works. (4) A complete detailed specification with conditions of contract, and in duplicate, one copy being for the builder's use. (5) Advertising and obtaining tenders for the work if let by public contract. (6) Complete details, sufficient for the ordinary workman in each trade to execute his portion of the building. This would mean ¼in. or ½in. scale drawings of the better class of work that might differ, and half- and full-size sections of all mouldings and the more delicate parts, and that full and explicit instructions for the proper execution of the work should be given in all cases. (7) Personal supervision by the architect or his deputy should generally be made monthly, or say once in six weeks, dependent upon the size of the buildings. For all other services, such as extra copies of the plans for local authorities, for taking out quantities, surveys of site, arrangements with adjoining owners, travelling or other out-of-pocket expenses, the architect is entitled to charge separately.

I have made this statement for the benefit not only of my querist of the building committees, but also of architects who sometimes come across very exacting clients who not only want a £4,000 job done for half the money, but will put an architect to the trouble of drawing and re-drawing until it is brought back bit by bit to the point where he has probably been told at the start that could not be exceeded for the proposed expenditure.

On the other hand, I have heard of architects—and some of them whose work has been hung in the Royal Academy—being content to supply builders with the flimsiest plans to ⅛in. scale, partly drawn, some portions to scale and others not, with no specification, no detail drawings, and then expecting their 5 per cent., which I maintain is not fair to the public nor to their professional brethren, as it tends to bring architects and their work into disrepute. And, in the question of personal supervision, I have heard of cases of really large works of a national character where the architect has been seen on them only at intervals of six months.

To merit the public confidence we must, as architects, show ourselves to be worthy of it by our actions, and I think that perhaps, after all, it is well occasionally to recognise what our duties are, because, though the ninety-nine members of our profession may go perfectly right and the single one may not, we hear more of that solitary case than of all the others put together.

The president afterwards spoke of Metropolitan improvements, comparing London with other cities, and concluded his address by references to the tenure of building sites and the prospects of the profession.

In the course of the evening it was announced that the Gold Medal of the Society had been voted to Mr. Walter Emden in recognition of his four years' service as president.

The New Public Dispensary for Leeds is to be erected from designs of Messrs. Bedford & Kitson, architects, of Leeds, in Hartley Hill, North Street.

Law Cases.

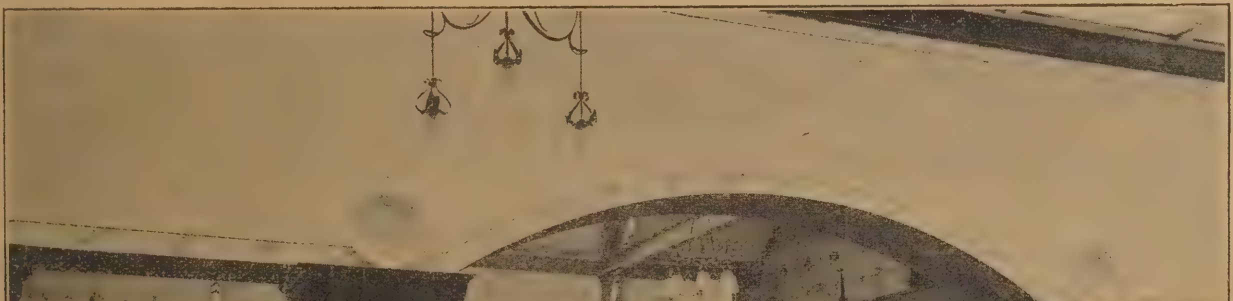
Cost of Window-Frames and Sashes.—At Colchester County Court an action was recently heard in which Mr. H. J. Linzell, builder and contractor, of Newmarket, sued Mr. Coleman, builder, of Clacton-on-Sea, to recover £45 10s. 9d. for window-sashes and frames and other work supplied, an amount based on a charge of 1s. per ft. super. Defendant paid into court £11 2s. 9d. of the amount, which was admitted, but in respect to a claim of £34 18s. for the sashes and frames he admitted £18 only, based on a calculation of 6½d. per ft., which he contended was a fair charge. Defendant counter-claimed for loss alleged to have been sustained through delay in the delivery of the sashes, and the fact that when delivered they did not fit. Mr. T. A. Cressy, architect and surveyor, of Clacton, thought a fair charge for the sashes supplied by the plaintiff would be 7d. per ft. His Honour Judge Tindal Atkinson gave judgment for the plaintiff for £26 2s. 4d. on the basis of 10d. per ft., with deduction on defendant's counter-claim.

Re W. H. Gibbs.—A first meeting of creditors was held in the Court of Bankruptcy on Wednesday last. The debtor traded as a builder at 5, West Kensington Terrace, W., under the style of W. H. Gibbs & Co., and the receiving order against his estate was made upon the petition of the Queen's Club Gardens Estates, Ltd. He stated that ten years ago he was worth about £10,000, and he then embarked on extensive building operations at Kensington, the transactions being carried through by a firm of solicitors. About August, 1898, a company—the Queen's Club Gardens Estates, Ltd.—was formed to take over the property from the debtor, the purchase price being £490,000, of which £390,000 was paid in cash, and the debtor took £100,000 in Ordinary shares. He stated that foreclosure proceedings on the part of mortgagees had affected the whole of his assets, and he attributed his failure to the stoppage of finances, heavy law and other expenses, and to ill-health. Proofs amounting to about £24,000 were lodged, and the debtor consented to an adjudication.

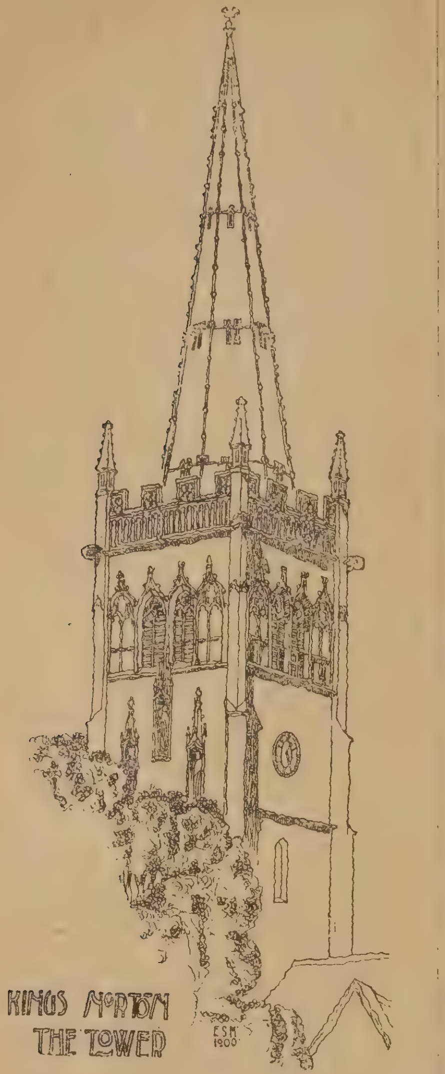
Non-Compliance with Sanitary Order.—At the North London Police Court last Wednesday Elizabeth Salt, the owner of several houses in Allen Road, South Hornsey, was summoned for a penalty for non-compliance with an order calling upon her to do certain sanitary work. She contended that it was impossible for her to do the work, as the main drainage was defective. Mr. Kennedy said that the defendant had rendered herself liable to a penalty of £130. He fined her £20 and costs, and recommended her to do the work at once.

The L.B.A. and Pipe-Fixing.—At the North London Police Court recently Messrs. Aiton & Co., steam-pipe fitters, of Western Works, Hythe Road, Willesden Junction, were summoned for doing certain work at the Hackney Electric Lighting Station without giving notice to the district surveyor, as required by the London Building Act, 1894. Mr. Meeson (the surveyor) said he found a 12in. steam pipe, tapering to 9in., with 6in. connections. The pipes were brought to the works and fixed by the defendants, and he submitted that that brought the matter within his purview. In defence Mr. Romain said that his clients were simply contractors for the fixing of the pipes. They had nothing to do with the structure. The builders made the holes in the walls and dug the trenches, all that was necessary for the defendants to do being to fix the pipes. He submitted that they did not come under section 145, which only applied to buildings. Mr. Fordham said he thought the fixing of steam pipes would come within the Act, but, on the other hand, as Mr. Romain had very clearly shown, the district surveyor had overlooked the fact that with regard to this special building it was exempt. He dismissed the summons with £1 1s. costs.

The Government Architect and Workmen's Wages.—At the Thames Police Court recently a number



THE "DAVY HALL" RESTAURANT, YORK: VIEW OF DINING HALL AND MINSTRELS' GALLERY. PENTY AND PENTY, ARCHITECTS.



of men who stated they were painters asked Mr. Mead's advice under the following circumstances. They had been working for a Government contractor at the Tower of London, and were paid at the rate of 7d. an hour. A short time ago the Government architect came round and on finding out what they were paid, said the contractor was under an obligation to pay them at the rate of 8½d. an hour. The contractor paid them at the rate of 8½d. for that day, and discharged them. Mr. Mead observed the architect had no right to regulate the rate of wages, and the men were only entitled to receive what they agreed to work for. He failed to see what the men had to complain about in getting 1½d. an hour more than they had previously received.

A Case affecting Underground Conveniences.—In the Chancery Division of the High Court of Justice judgment was recently delivered in the case of the *London and North-Western Railway Co.* v. *Mayor, &c., of Westminster*. The plaintiff company in 1886 purchased some houses in Parliament Street and Bridge Street, Westminster, which had vaults projecting beyond the boundary line of the premises. In June, 1899, the footway was 12ft. 9in. wide, but in that year certain blocks of buildings in Parliament Street, opposite the plaintiffs' premises, were removed and the footway widened to 21ft. The defendants decided to construct conveniences under Parliament Street, with descents from the footway on either side of the road, which descents, it was said, interfered with the plaintiffs' rights. Mr. Justice Joyce held that the construction of the defendants' works was in no way *ultra vires* or unreasonable. With regard to the plaintiffs' case as to soil line, the soil to the centre of the road could not be the plaintiffs'. In making the staircase, however, the defendants had taken 2ft. 9in. of the plaintiffs' soil, and he made an order for the removal of that part of the staircase which was on the plaintiffs' land. He made no order as to costs.

HARBOUR CONSTRUCTION.

The Effect of Sea-Water on Portland Cement.

IN the course of a paper on "Harbour Construction," read before a recent meeting of the Aberdeen Association of Civil Engineers, Mr. James Barron, C.E., said that a very large part of all harbour works was the erection of walls. Possibly no subject existed about which there was such a lack of experimental data as on the lateral pressure on walls. In the case of sea walls the question of vibration by shock from a wave and its sudden withdrawal exercised an effect which was not easy to determine, and engineers had to exercise their own judgment. They found dock and quay walls ranging in thickness at the base to 50 per cent. of their height, and in some cases 25ft. of base per 40ft. of height had been found necessary. The rule which had been generally followed was to make the thickness at the base one-third of the height and half-way up one-fourth, but a good deal depended on the nature of the foundation, the suitability of materials used for backing, and on the exposure to the force of the sea.

In regard to the materials of construction and the form of quays and piers, he said that latterly changes had taken place regarding the description of materials, due in large measure to the introduction of iron and steel, and particularly to concrete made with Portland cement. The possibilities of concrete as a material for construction were remarkable. The other day he saw being manufactured at Southampton Docks piles 60ft. long, with a cross-section of 14in. by 14in., and he was informed that they could be handled and driven as successfully as timber piles.

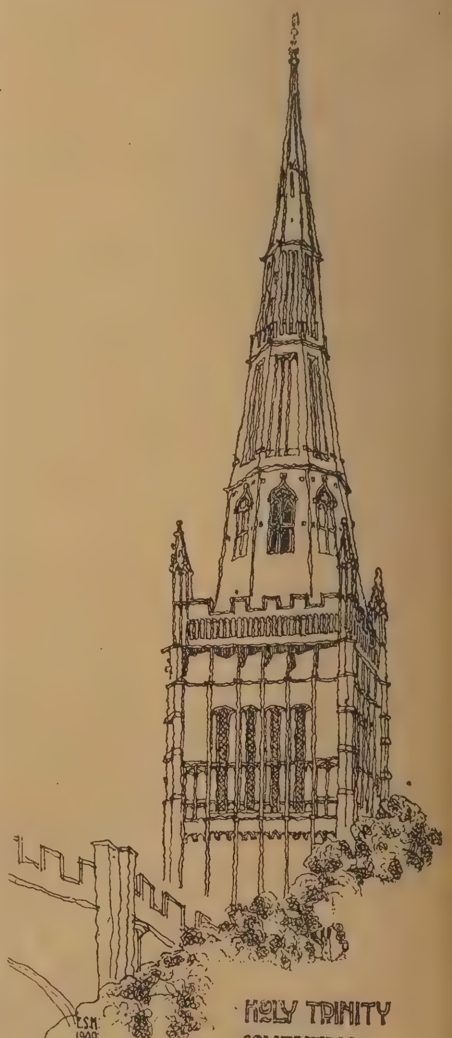
The materials chiefly used in sea works for harbours such as he described were stone, cement, concrete and timber. Where stones were abundant and of sufficient size, and could be obtained at a reasonable cost, it was often expedient to use them in preference to concrete. They were more durable, and stood wear and tear better. Cement-concrete was now found to be the most suitable material for the construction of harbour works in the open sea. The chemical properties of Portland cement were now better understood; and notwithstanding the recent scare about chemical action on cement-concrete in the sea, engineers were finding that by using the best quality of cement and regulating and adjusting the aggregates of concrete to meet the various requirements of the work satisfactory results were obtained. Referring to timber as a means of harbour construction, Mr. Barron said that it was specially adapted for piers and quays placed in sheltered bays or rivers, and, as a rule, it would be found to be cheaper than either stone or concrete, particularly if the work was on soft ground and in deep water. The kinds of timber chiefly used were pitch-pine and greenheart; the latter, although somewhat costly, should be used in salt water, as it was the better able to resist the ravages of that destructive worm, the teredo. He had occasion recently to examine a number of piers which he constructed twenty years ago, and found that the greenheart timber was as sound as when erected. Creosoted pitch-pine was often used for work above high-water level.

In the discussion which followed the reading of the paper, Mr. R. G. Nicol, C.E., Harbour Engineer of Aberdeen, observed that the great thing in using concrete was to see that plenty of cement was put into it. In the past engineers got to be very daring, and reduced the quantity of cement more and more. Suddenly all over the country failures took place. They would hardly believe it if he told them the number of works that were in ruins and which were constructed a few years ago. One thing he would always like to see in breakwaters—that was the cement faced. He pointed out that in the case of the Aberdeen pier, which was faced with granite 18in. thick, the battering that it received had reduced this facing to half its original thickness. They might judge what the effect would have been had the softer cement been exposed. Mr. Nicol then proceeded to explain how concrete was laid in position in bags perfectly dry. The mass was mixed up and enclosed in its covering and then sunk. Their experience of this method at the Victoria Dock had been most satisfactory. The mass became thoroughly impregnated right to the centre, and was more solid than that made up before being placed in position. How such a system would do with very large masses he could not say, as he had not tried it, but they were to increase the size of the bags in the future.

After a few remarks by the secretary, Mr. Barron, in reply, said with regard to the action of the sea on concrete he thought it was the general experience that if there was enough cement in the concrete there was no danger.

TWO CHURCHES.

THE following notes accompany the sketches on this page by Mr. E. Stanley Mitton:—King's Norton Church is a fine example of Perpendicular work, and is greatly admired for its graceful and remarkably fine spire, which is crocketed and has canopied windows. The nave has no clearstory windows, but has some Decorated insertions. The school-house which adjoins is a fine specimen of half-timber work, and is one of the many charming fragments of architecture to be found round about Warwickshire: it was erected in the sixteenth century, and contains a very fine library of 700 volumes, given in the reign of Charles II. by Thomas Hall.—Holy Trinity, Coventry, suffers somewhat in effect from its too close proximity to St Michael's. The spire rises to a height of 237ft., while St. Michael's rises 303ft. The original spire was unfortunately blown down in 1664, and caused considerable damage to the body of the church. The ancient pulpit is probably one of the finest to be found around, or, as some say, not to be surpassed in the kingdom. Dugdale says that the first mention of the church is in the forty-fourth year of Henry III.—that is, in 1260.



Bricks and Mortar.

APHORISM FOR THE WEEK.

An architectural object pleases the eye when its leading parts are so arranged that the attention is successively and correlatively struck by the most essential down to the least important feature.—PROFESSOR DONALDSON.

Our Plates. THE little chapel of the Brompton Consumption Hospital was erected and consecrated in the year 1850. It is picturesquely situated in a corner of the grounds of the old hospital in Fulham Road, sheltered by many trees, and hardly visible from the road. A covered corridor with tower and record room affords communication with the main block of the hospital. The cost was £2,500, out of which sum £250 was spent on the oak fittings, choir stalls, &c. There is a sedilia in the chancel on the right, and credence on the left, and most of the windows are filled with stained glass (the latter, with the exception of a new window, is however poor, and was not in the original contract). The architect of the original form of the chapel was the late Mr. E. B. Lamb, F.R.I.B.A. The drawing is by his son, Mr. E. B. Lamb, architect, of 31, Craven Street, Charing Cross, W.C., and was made before the enlargement by the late William White, F.S.A,

Church Crafts. THE CHURCH CRAFTS LEAGUE held its second annual meeting last Thursday at London House, 32, St. James' Square, S.W. The Lord Bishop of Rochester, who was in the chair, in moving the adoption of the annual report, said the membership had been doubled both amongst the artists and the ordinary members, and the work done through the League had increased proportionately. The applications received for advice during the year had numbered 91, and in every case this had been given free of all cost to the enquirer. Work had already been placed in twenty-six churches, while a large number of schemes were in progress and would come into next year's statistics. The Committee had also taken in hand the compilation of a book of simple designs for churchyard monuments, with suggestions for the use of clergy as to the protection of churchyards from disfigurement, and it was hoped that this might help considerably towards a much-needed reform. Mr. T. Stirling Lee seconded the adoption of the report. The Bishop of Rochester was then re-elected president. The election of three ordinary and three artist members of the committee, to fill the places of those retiring under the rules of the League, resulted in Canon Rhodes Bristow, Dr. F. D. Drewitt, Mr. J. T. Micklethwaite, F.S.A., Mr. R. Anning Bell, Mr. T. Stirling Lee, Mr. C. O. Skilbeck, being elected, while Mr. T. Dyer Edwardes was elected treasurer for the ensuing year. An election of artist members followed, the successful candidates being Mr. Robert Marchant, architect, Mr. Robert Hilton, metalworker, Mr. Jasper Brett, glass-worker, Mr. Hilyard Swinstead, painter, and Mr. John T. Seddon, architect.

Alfred Stevens. MR. J. ATWOOD SLATER, speaking at a recent meeting of the Bristol Society of Architects, when a paper on Alfred Stevens was read by Mr. John Fisher, said: I have for much time dispassionately held that Alfred Stevens, with Turner, were the first artists that England produced from the middle of the eighteenth to that of the nineteenth centuries; and that, compared with the great oracles of the past, he reasonably approaches Michael Angelo, whom he unquestionably touches and sometimes surpasses. I think that there is evident, in carefully examining the figures upon the Wellington Monument and the Dorchester House chimneypiece, a finer knowledge of line in Stevens's work. Michael Angelo's Medici figures, and, indeed, his other famous works, are not so unequivocably good; the effigies superimposing the sarcophagi are, for brief instance, "pillowy," though they may be more anatomic. The suavity of nature's hypo-refined grace is not traceable in their easy posture. The fact is that they pose for something, generally their own animal idiosyncracy, if not respectable vanity. Stevens's figures always, on the contrary, pose for their own decency, which throws into the core, the heart of the monument, such an expression of beauty, giving rise to the word innate, quenching the sense of frivolity, which unrestrained disordered state of things oozes out somewhere, or is at any rate felt "in the air" in Michael Angelo's works. Stevens's head was wonderfully poised on his own "torso" to know and feel this with such thrilling, vital, consistent certainty. You catch awhile his lovely idea in the strong fragrant symmetry permeating his work. The iron soul of the man implants his lines of strength far inside the actual bounds of the visible crust, and the mind of the idea expanding naturally is caught at the salient "processes" in curves and features, betokening nothing that touches but grace. I should mention that there is one fact which describes minutely my veneration for Stevens's work at its best, perhaps its fullest; whereby I mean that inspection of his intellectual labour has always restored to me the time so wisely occupied in regarding it, proving that there is goodness, virtue, essence in it past all fellowship with ephemeral things. There is a true, not a laconic, logical and prophetic inference in it that is appropriately styled "time," the finest embodiment of musical equipose, felt to a "tick"; no faltering, barbaric or false quantities, but a sustained and equable, uniform tone of chromatic measure, meted out as by a mind imbued by but sacrificing the scale of colour to its own actual achieved end.

Housebreaking by Dynamite. EGREMONT HOUSE, about half a mile [from Silverton, stands on an acre of ground. It has 150 rooms, and has been unoccupied for more than forty years. It was built sixty years ago by Lord Egremont, who only occupied it for about four years, when he died without seeing the completion of the undertaking. To complete the structure a fortune would have had to be spent, and as a result it has fallen into the hands of Messrs. Atkins & Taylor, of Exeter, who are demolishing it and making what money they can of the materials. Large marble mantelpieces have fetched nearly £50 each. Messrs. Atkins & Taylor recently blew up the whole of the front of the house by dynamite. Three successive charges were exploded, and the experiment was successful, nearly the whole of the front being brought down.

Mr. Haité on Decoration. UNDER the auspices of the northern district of the Incorporated Institute of British Decorators, Mr. George C. Haité delivered a lecture at Sheffield on November 28th, the subject being "Decoration and Decorators: A Survey of the Past and Present." Mr. Haité dealt chiefly with the domestic aspect of decoration, referring to it as the art which surrounds us during the most impressionable period of our lives—the days and hours of childhood. Its character, therefore, was of supreme importance. The influence for good or bad which it exerted was much stronger than was generally imagined, and in his opinion every nursery should be decorated in such a manner as would tend to educate and elevate the infant mind. Decoration was, moreover, the only undying evidence of national life and thought, and he held it to be one of the most important of the arts. He briefly traced the past history of decorative art and pointed out that until quite recently decoration had been a luxury only obtainable by the rich. Since the introduction of wallpaper, however, it had become accessible to the people, and he thought that there was no longer an excuse for anyone failing to secure an artistically-decorated home if he desired it. In domestic decoration our advantages were far in advance of our French neighbours, and in support of this contention he quoted the opinion of a most eminent French decorative artist and critic, expressed in a letter to the lecturer. Decoration was at its lowest ebb, perhaps, at the beginning of the last century, but after the great Exhibition of 1851 a change became manifest. A few leading architects with the feeling and faculty of design took action, and he dated the general improvement from the time when Wyatt, Godwin, Talbot and others, designed better wallpapers, and, with the aid of enlightened manufacturers, produced them. Decoration was not yet, however, what it ought to be. His first note of complaint was that the spirit of the age was "Humbug." It was undoubtedly the dominant feature of every phase of life to-day; found in politics, in literature, and, more than anywhere else, in art. He pointed out that some exponents of what is called "Fine Art" assert that there are no laws, no general principles, to govern art-expression: but this was wrong. The great principle which applied to all art-expression was "fitness." Let the expression of art be of our own time, and our own faith, accepting and content only with the best to be had; and rendering it capable of bearing the tests of logical reasoning. Exceptional opportunities for the decoration of public buildings and palaces were few. In a humbler way, however, in domestic decoration, problems occurred that called for all the judgment, experience and originality of the decorator. Substitutes for hand work were now supplied most plentifully, and in the right choice and use of these materials the decorator of to-day had great scope for the display of individuality and skill. It was no use inveighing against the use of these materials, for they were an evidence of the times, and many of them of great excellence. In fact, the manufacturer had outstripped the decorator. He had supplied media, artistic in form and colour, at a price possible for all; and it was for the decorator to apply these with skill, taste and judgment. Some people contended that decoration was decadent, but if such were the case it was because of the commercialism imported into its practice by the huge combinations of decoration with other trades. In conclusion he urged that decorative art was a necessity in the progress of civilization, and should therefore be educational; that manufactured goods were not essentially antagonistic to the art of the decorator; that it was desirable that the art of the decorator should be kept apart from other trades, instead of being undertaken by linen-drapers and furnishing firms. He submitted as a scheme that the decorators of the country should appoint a council, through this Institute, to organize an exhibition of decorated rooms in London to be kept open, say, for three months, and that afterwards it might be sent to the larger provincial centres. He thought such an exhibition would go far to abolish what he designated as the "Tottenham Court Road" school.

A Glasgow Workmen's Lodgings. ON Saturday, November 23rd, the members of the Glasgow Technical College Architectural Craftsmen's Society visited the model lodging for men known as Whitehouse, situated at Springburn. The promoters are a syndicate under the name of "The St. Mungo Boarding House Company." The idea of the management is not so much to cater for the single-night lodgers as to provide for permanent or weekly boarders. For the sum of thirteen shillings and sixpence per week a working man has his breakfast, dinner, tea and supper served in a dining-room large, airy and well lit, on tables laid with spotless tablecloths, and waited on by attendants. There is a library, recreation- and billiard-rooms. Each bedroom is provided with a wardrobe, chair and chest of drawers, in addition to a bed upon which is not placed the inevitable black-and-red bed mat, white taking the place of the black. The architect is Mr. Whitey, of Glasgow. The walls are constructed of brick, rough-cast cement on face, with red tinted cement as dressings. The floors are fireproof, and the buildings are lighted throughout by electric light. Steam is employed in the cooking arrangements, and the laundry work and cleansing is accomplished by the most improved machinery. In addition to the hotel proper, with its adjuncts, there is provided a shooting range.

"A Bricklayer's Lay."—The following is the original of the "Globe's" recent skit—it was published in "Judy" more than thirty years ago, and was styled "The Working Man's Toast":—

Eight hours' work, eight hours' play,
Eight hours' sleep, eight bob a day.
'Ate 'ard work, 'ate hupper ten,
'Ate all Tories, 'ate "Old Ben."

("Old Ben" is Lord Beaconsfield, of course.)

Views & Reviews.

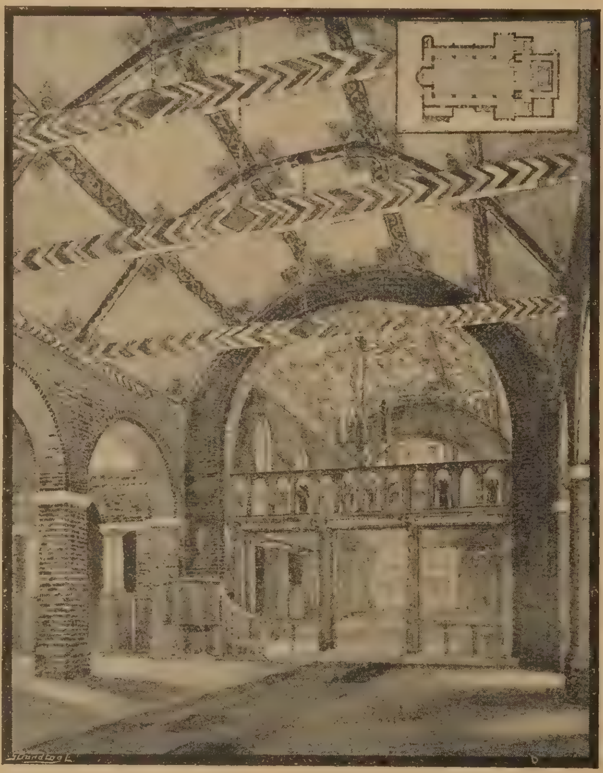
The Improvement of Towns and Cities.

Mr. Robinson is an American who is (apparently) familiar with our own country and with Europe in general, and his object is "not to give an exhaustive discussion of the subject of improvement of towns and cities, but to review the whole broad field of modern effort; to pick out the salient points, to declare the best that has been done along every line, and to encourage further effort by showing the progress attainable because somewhere attained." He could have no better object; for the dreamers and the talkers, the idealists and the socialists, and all the rest, have had their say, and albeit we are now in danger of being surfeited by them. The generalisations of Paris and London, as compared together, have been harped upon till we go in fear and trembling of every presidential address, and it is pleasant therefore to turn to the actual results and to find them gathered under different sections, analysed, and criticised in a common-sense manner. For instance, in the section of this book which deals with the planning of streets the author does not waste himself on visionary improvements, which, however desirable, are never likely to be carried out, but explains the three types of plan in general use—the gridiron plan, which offers the maximum area for building sites "and a regularity of almost childish simplicity" (like Washington or New York); the diagonal plan in which avenues afford economy of communication, vistas of much beauty, and open squares and spaces that are grateful to the eye and of considerable sanitary value (as in Paris); or the ring plan, the most noted example of which is seen in Vienna, with the famous Ringstrasse within and Gürtel-strasse (girdle street) without. The author goes into the details of all these plans and so makes his matter of real interest and value. He adopts the same method in regard to street-cleaning and paving, lighting, subways, smoke-prevention, advertisement abuses, parks, the placing of sculpture, architectural obligations, popular education in art, and the work of officials. In dealing with buildings that crown an eminence he insists that they shall be white and pure. "So rose the Acropolis over Athens, and the opposing temples of Jupiter and Juno on the twin heights of the Capitoline hill over the Rome of the Emperors. It is no dream. A dozen modern structures carry out the idea. Build them of dark material and they must glower heavily over the city; build them of white marble, in chaste design, and their beauty is not incongruous in the ugliest industrial city." A matter which offers many curiosities is the nomenclature of streets. The numerical and alphabetical names of New York, Chicago and Washington are hopelessly prosaic, being somewhat akin to the numbering of convicts in large prisons; "Main Street" as the title of a leading thoroughfare exhibits but feeble wit, yet the Paris example of the Rue du Quatre Septembre is little more commendable; and sometimes the search leads one to such quaint abstractions as those in New Orleans—Virtue, Law, Industry and Pleasure as street names, even to the sufferance of Goodchildren Street! So it behoves us to look well to our street names. The author is not a lover of the tall building, which he asserts æsthetically demands broader streets and open spaces: in Paris the maximum height of facades is fixed at 65½ft., in Rome it is 78½ft., in London 80ft., and thus the increase goes to 125ft. in New York and 130ft. in Chicago, changing thoroughfares into sunless chasms. The book sets forth what has been *done* for the improvement of towns and cities; and as an index of its thoroughness it is sufficient to note that three pages are occupied by the names of societies and organisations whose efforts and aims in different cities have been considered.

"The Improvement of Towns and Cities, or the Practical Basis of Civic Æsthetics." By Charles Mulford, Robinson. New York and London: G. P. Putnam's Sons. The Knickerbocker Press. Price 5s. nett.

Buddhist Art in India.

Professor Albert Grünwedel's handbook on "Buddhistische Kunst in Indien" was a considerable contribution to the knowledge of Indian Buddhist sculpture, and it is to be regretted that this English translation has been so badly done that it is wearisome to read it. All the clearness of the original has been lost and one's brain is kept always on the rack, a fault common to the literal translation of German. With Mr. James Burgess, late Director-General of the Archæological Survey of India, to revise it, involved English was not expected. The chief value of Dr. Grünwedel's work is in the classification and comparative analysis of the widely-diffused and chaotically-arranged specimens of Buddhist sculpture in the museums of India and Europe, specimens mostly collected haphazard without proper records being kept of them. The author's criticisms of Buddhist art will not be acceptable to many persons, and (like many archæologists) he lays too great stress on the chance resemblances of ordinary forms of design to argue their derivations.



CAMBERLEY CATHOLIC CHURCH, SURREY.
C. H. B. QUENNELL, ARCHITECT.

"Buddhist Art in India." Translated from the "Handbuch" of Prof. Albert Grünwedel by Agnes C. Gibson, revised and enlarged by James Burgess, C.I.E., LL.D., F.R.S.E. London: Bernard Quaritch.

Statics.

This is a very able elementary treatise on the statics of co-planar forces, and we can recommend it as a text-book for building construction and engineering students. The special feature of the book is the continual insistence upon the double aspect of the subject—the geometrical and the analytical. The advantage of this treatment need hardly be pointed out, for it brings the correlation of geometry and analysis into constant prominence. The illustrations are admirably clear, a point of much value in these days of cheap and bad reproductive processes.

"A Treatise on Elementary Statics for the use of Schools and Colleges," by W. J. Dobbs, M.A. London: Adam & Charles Black, Soho Square, W. Price 7s. 6d.

MANCHESTER FIRE-STATION COMPETITION.

LAST week the twenty-five sets of designs for the new fire- and police-station to be erected in London Road, Whitworth Street and Fairfield Street, Manchester, were publicly exhibited at the Town Hall. Mr. T. Worthington, F.R.I.B.A., of Manchester, was the assessor appointed by the Watch Committee. The first premium of £300 has been awarded to Messrs. Woodhouse & Willoughby, of Manchester, with Mr. John Langham, also of Manchester, as joint architects. The second premium of £200 has been awarded to Mr. G. Watson, of Edinburgh; and the third, of £100, to Messrs. Mangnall & Littlewood, of London. The site (which is triangular) will be mainly occupied by the new fire-station, the police and ambulance stations being only a small adjunct. The first premiated plans provide very comprehensive accommodation for an efficient fire brigade. The front elevations show a free treatment of the English Renaissance of the eighteenth century, and will be executed in Ruabon red brick with buff terra-cotta dressings. The frontage to the London Road is 260ft., to Fairfield Street 328ft. 6in., and to Whitworth Street 234ft.; the Commerce Street corner is 97ft. 3in. The buildings generally consist of ground floor and three storeys. The fire-station will provide space for eight fire engines, the room being 182ft. by 33ft. with eight doors to the front, the horses being stabled at the right and left rear of each. On the ground floor at the corner of London Road and Fairfield Street premises suitable for a branch bank are provided. Adjoining this in London Road the plan provides for a branch public library occupying the ground floor and basement. Above the bank, with a private entrance from Fairfield Street, the chief officer's residence is arranged for occupying the first and second floors. The second officer's quarters will be at the corner of Fairfield and Commerce Streets. The third officer's quarters are approached from the main chief staircase, and are over the offices. The other firemen's tenements occupy the first, second and third floors in London Road, with the exception of space allowed for a roomy gymnasium. This is to occupy the corner of Whitworth Street and London Road. It will embrace the ground and first floors, the area being 100ft. by 33ft., and it will have a gallery around at the first-floor level. Below in the basement will be a spacious plunge bath with all conveniences. Above the gymnasium is space for stores, and on the top floor are the laundries. In the drill yard will be a drill balcony 80ft. high, for the purpose of drilling with the big escapes. In Whitworth Street the buildings comprise loose boxes, sick-horse stables, harness-room, &c. The total estmated cost of the buildings, including the Gamwell electric installation, will be £85,000. The site cost £22,000, so that when completed the work will entail a total cost of about £110,000.

Camberley Catholic Church, Surrey. — This church, by Mr. C. H. B. Quennell, is being erected in the main London Road near the entrance to the Staff College. The seating accommodation is for 364, including the western gallery. As to materials, the brickwork, where shown, is in T.L.B. red facings, with panelled wood dado all round the church. The roof it ceiled in plaster, and Mr. Paul Woodroffe is responsible for the decorations and glass. Externally, the elevations are very simply treated. The walls are faced with T.L.B. red facings, all detail being in brick; windows in wrought-iron, roof covered with red tiles and oak shingles to a bell turret. The lowest estimate was from Mr. E. C. Hughes, builder, of Wokingham, for £3,100, which included ventilation and heating, pulpit, &c., but not internal decoration or seating.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Text-books on Building Construction.

Wisbech.—B. H. writes: "What text-book on building construction would you recommend to a student, in a district where there is no art school, intending to sit at the May, 1902, examination?"

"Rivington's Notes on Building Construction" is the most trustworthy text-book. Part I. (10s. 6d.) is the first stage or elementary course; Part II. (10s. 6d.) is the second stage or advanced course; but for the Honours examination at South Kensington, Part III. (21s.) on Materials and Part IV. (15s.) on Calculations for Structures are required. Part III. is generally to be relied upon for its facts, but is very unscientific in treatment. Part IV. is unsatisfactory. The articles on building construction now being published in our columns should meet the want, but if you have a sufficient knowledge of higher mathematics you cannot do better than study Rankine's "Manual of Applied Mechanics."

Wood Roofs.

Hull.—F. R. A. writes: "Which is the best form for a wood roof-truss for a span of 46ft., the pitch being 45 degs.?"

A Queen-post roof, examples of which will be found in Rivington's "Building Construction," Part II.

Extra Strength due to Herring-bone Strutting.

Croydon.—Oval writes: "Please give formulæ for determining the extra strength which one row of herring-bone strutting gives to a floor."

Herring-bone strutting adds no strength to a floor as a whole, but helps to spread a concentrated load, beyond the point at which it is applied, to the surrounding joists. There is no formula applicable, although the case is very much like that of a "distributing girder" in the construction of railway bridges. It would be possible to obtain a formula by testing a floor to destruction; but without such experiment there is no way of arriving at the actual increase of strength. HENRY ADAMS.

A Difficult Point under the L.B.A.

London.—H. B. writes: "We have made application to the Orsett Rural District Council for permission to erect tenement buildings at Tilbury Park Estate in accordance with the enclosed plan (not reproduced). The buildings are of two storeys and the walls do not exceed 25ft. in height. Each house contains four tenements, two on the ground floor and two above. Each tenement has a separate entrance from the front, those to the first floor having a separate staircase each. The Orsett Rural District Council object to plans on the ground that the central division wall is a party wall and should be 9in. thick for its entire length and should be arried up to the underside of the slates on the roof. We contend that we are entitled to build the wall is 4½in. thick for whole length and need not take it up beyond the ceiling of the first floor. The by-law upon which they base their objection is similar to section 5, sub-section 16 (a) of the London Building Act, 1894. Under what section of this Act is it allowable to build the central wall in 4½in. brickwork and to the ceiling level only?"

It would not be possible under the London Building Act to build a party wall 4½in. thick and to stop it at the ceiling-level, as shown on the plan submitted. There is no restriction to the size of a domestic building; and if an opening were made in the 4½in. wall separating the two buildings, I think it might be held that the tenements constituted one building only and did not require a party wall. I think it will be found on enquiry that this is what was done in the case of the building in Croxted Road, and that the Act was evaded in this manner.

X.

Architectural Photography.

Edinburgh.—Photo writes: "On p. 493 of your issue for July 31st last you stated that Sir Benjamin Stone 'observes all the main requirements' in his photographs. What are the requirements for successfully photographing architectural subjects?"

It would seem to be a simple matter to answer this enquiry, but as a matter of fact so many considerations are involved that columns might well be devoted to them, and if "Photo" really wants to go into the subject he had better read it up in the numerous books which can be consulted at any public library. We may briefly say, however, that the main requirements of an architectural photograph are that its vertical lines shall be vertical, its horizontal lines horizontal, its arches and windows shown complete and not cut in halves or quarters, its focus equal over the whole picture, its foreground, middle-distance and sky harmoniously arranged, and its composition truthfully rendered. When, in the notice of the exhibition of photographs at South Kensington, we stated that it was perhaps unfair to compare Sir Benjamin Stone with such an architectural photographer as Mr. F. H. Evans, we meant that he displays no such technical ability or artistic feeling. Mr. Horsley Hinton once remarked that he objected to printing being simply a matter of sun and paper, and it is just this interference in correcting defects or enhancing portions of a photograph which distinguishes between the ordinary man and the artist. Yet it must not be thought that such interference necessarily means the distortion of actual facts. For example, Mr. Evans will spend an immense amount of time in composing an interior stone stairway on his screen, and will exercise infinite pains and numerous devices in developing and printing, but the result is not to show the stairway as it does not exist, but to represent its values to the utmost advantage, making a picture as well as a record; whereas the ordinary photographer would produce a record only. This practice is of course subject to abuse, and undoubtedly tends to conventionalities, but in capable hands it is perfectly safe and perfectly commendatory.

Book on Modelling.

Liverpool.—Modeller writes: "Is there any good book on modelling in clay?"

"Modelling: A Guide for Teachers and Students," by E. Lanteri (Chapman & Hall; 15s. nett).

Architect's Liability for Contractor's Neglect.

Preston.—R.I.B.A. writes: "Is the architect of a new building liable for the neglect of the contractor to make good the damage caused by him to adjoining property?"

No. The builder is responsible, and he should be sued.

Carolina Pine.

Swindon.—J. H. J. writes: "Kindly give some information as to the quality and durability of Carolina pine. Is it suitable for flooring, grooved and tongued; would it be advisable to use this wood in connection with pugging?"

Carolina pine is not good for flooring, as it wears in ribs, being coarse in grain.

Ownership of Drawings, Specifications and Quantities.

Y. Z. writes: "I have had extensive alterations made to my house, the contract for which has now been completed about eighteen months; but several things have not been done to my satisfaction. I have called the architect's attention to them, and have written to him asking for a settlement, but cannot get anything done. What further steps can I take? Can I demand the drawings, specification and quantities to ascertain the quantity and quality of the materials to be used?"

The architect is in the position of an arbitrator between the contractor and client, and is only liable for incompetency or fraud. You cannot demand the specification or drawings as these are the architect's property, being his memoranda, and the quantities are the property of the builder who paid the quantity surveyor's fee, and are merely aids to him in estimating. To prove fraud you must be able to prove collusion or swindling.

Books on Elizabethan Architecture.

Newport.—E. E. writes: "Please mention some books dealing with Elizabethan architecture."

"Early Renaissance Architecture in England," by J. Alfred Gotch (Batsford, 21s.), and the general histories, such as Fergusson's and Fletcher's.

Examinations for Architects and Surveyors.

Tunbridge Wells.—A. G. writes: "Are there any preliminary examinations to be passed before anyone can enter for qualification as A.R.I.B.A. or F.S.I.; if so, where can I obtain a copy of the examinations?"

Naturally, there are examinations to be passed. Obtain the Kalendar of the Royal Institute of British Architects from the secretary, 9, Conduit Street, W., price 2s. 6d., and the syllabus of the Surveyors' Institution examinations from the secretary, 12, Great George Street, Westminster, S.W., price 1s. 6d. These give the latest examination papers.

Designs for Chimney-pieces.

Cardiff.—Ionic writes: "Where can I procure designs of marble and stone chimney-pieces, and would they be copyright?"

You can obtain old examples from measured drawings contained in such books as the Abbey Square Sketch-book and the Architectural Association Sketch-book (to be obtained from Mr. B. T. Batsford, of 94, High Holborn). Modern examples are chiefly illustrated in trade catalogues and the building periodicals, and are copyrighted.

Cost of Rubble Walling and Railings.

Moseley.—E. S. M. writes: "What is a stone rubble wall with cast-iron railings worth a foot run? It is to be erected of local stone near Bolton, Yorks. Will a thickness of 14in. be sufficient for the district?"

We can only give you rough approximate prices. The price of the cast-iron railings depends upon the design, but they would probably cost about 2s. 6d. per ft. run. Coping in local stone would cost about 1s. per ft. run, and the rubble wall about 1s. per ft. cube. A 14in. thick wall would be quite strong enough; it might be less.

Explanation of Ivory Sector.

London, W.C.—O. G. writes: "I have an old-fashioned single-fold ivory rule marked with certain scales diagonally across it. What is the meaning of these scales, and how are they used? They appear to be logarithmic scales like those on a slide rule."

The scale drawn is known as a sector. A full description of its use will be found in Heather's "Drawing and Measuring Instruments" (Crosby Lockwood & Son, 7, Stationers' Hall Court, E.C., price 1s. 6d.). This scale was commonly used by engineers before 1850, but it is now practically obsolete, the slide rule having taken its place.

HENRY ADAMS.

Strength of Steel Stanchion.

Newcastle-on-Tyne.—Student writes: "In designing a steel stanchion 20ft. long to carry a load of 20 tons on the top and 18 tons on a bracket 10ft. below, and using a 12in. by 6in. by 54lbs. R.S.J. (Dorman Long & Co), what calculations would be necessary (1) to arrive at the correct form and dimensions of the bracket and the number of rivets that would be required to ensure proper resistance to the stress; (2) to arrive at the area and thickness of the concrete that would be required to bear the load on compact earth if the usual stone base were omitted; and (3) what difference would it make in the calculations if these loads were taken in the direction of the flanges of the stanchion instead of in the direction of the web?"

A 12in. by 6in. by 54lb. Dorman Long R.S.J. used as a stanchion would carry 38 tons axially, but would not be strong enough to carry 18 tons on a side bracket and 20 tons on top, owing to the increased compression set up on the bracket side of the stanchion by reason of the resultant of the load being out of the centre. In answer to the other questions (1) the bracket surface should be at least large enough to limit the load to 40 tons per ft. super.; therefore, 18 tons would require a bracket not less than, say, 12in. by 6in., but this may be reduced if the web of girder is connected to stanchion by vertical angles on each side. Assuming $\frac{7}{8}$in. steel rivets, each will bear $2\frac{1}{4}$ tons single shear; therefore, $18 \div 2\frac{1}{4} = 8$ rivets as the minimum to connect the girder to stanchion; but it would be wise to increase the number in case of some not quite filling the holes. (2) A stone base is not essential, but if the stanchion rests direct upon the concrete the flange must be considerably enlarged. On cement-concrete the flange to carry a load of 40 tons should be 10 sq. ft. area, properly stiffened. The area of concrete should be such as to reduce the pressure on the earth to, say, $1\frac{1}{2}$ tons per sq. ft. The thickness of the concrete should be, say, twice its projection beyond the flange. (3) A stanchion of this kind will carry much less if the girder butts against the web than if it butts against a flange, owing to the great difference in the moment of inertia in the two directions. This matter is pretty fully worked out in "Designing Ironwork, 2nd Series, Part II." (Spon, 2s. 6d.) There is not space to reproduce the methods here. HENRY ADAMS.

New Patents.

These patents are open to opposition until January 6th, 1902.

1900.—Reciprocating Wood-Sawing Machines.—22,909. G. Pickles, Royd Iron Works, Hebden Bridge, Yorks. Short rods are provided at each side of the saw-frame, connected at their lower ends to the discs on the main driving shaft, and at their upper ends to a horizontal cross-bar secured to the frame. By thus dispensing with long connecting rods it is claimed that the working of the machine is made safer and that a higher speed is obtainable.

Stair Treads.—23,212. T. W. Corbin, 39, Victoria Street, Westminster, S.W. A cast-iron frame, forming a grid, is filled in with cement (or other suitable material) so that it stands above the iron on each side. This tread is inexpensive and can be reversed when one side becomes worn.

1901.—Artificial Marble.—16,640. O. Hertwig and E. Liebaug, both of Dörnfeld, near Königsee, Germany. A mixture is made of magnesite, 16 parts; chloride of magnesium, 17 parts; flint, 45 parts; kaolin, 5 parts; and water, 17 parts. This mixture is cast or poured on glass, with or without colouring matter to imitate the veining. It has a highly polished surface, and is claimed to be more tenacious than natural marble.

The following specifications were published on Saturday last, and are open to opposition until January 13th, 1902. *The name in italics is that of the communicator of the invention. A summary of the more important of them will be given next week.*

1900.—20,074, Frost, saw benches. 20,217, Lake (*Blamey*), door-fasteners. 20,496, Pruce, securing knobs and handles to spindles. 20,993, Moore, windows. 21,238, Aston, conveyors. 21,276, Robinson, pipe-joints for water-closets. 22,171, Twamley, chimney-pots.

1901.—339, Swift, closing device for the outlets of sink and other waste pipes. 542, Evans, closet-seats. 573, Bundy & Conne, weatherproof thresholds and window-sills. 623, Murchland, syphonic cisterns for water-closets. 770, Eicher, Will & Duncombe, door-locks and fastenings. 925, Abeleven, sheet metal roofing. 1,526, Wolfenden, apparatus for preventing steamy windows. 5,426, Pike, chimney tops and ventilating cowls. 6,158, Prior, hot-water boilers of kitchen ranges. 7,206, Newbigging, locking device for gas or other taps. 7,658, Jansen & Müngersdorf, coffered ceilings. 11,706, Weigle, organ pipes. 14,394, Prince, kilns for bricks, tiles, &c. 15,802, Stone, cork insulating strip for buildings, &c. 17,435, Burridge & Brown, saws. 19,413, Rymer, firegrates. 19,561, Osbourn, rust joints.

Builders' Notes.

Mr. Thomas Jackson, of Leyland, who carried on an extensive business as a builder and contractor, died recently at the age of fifty-four years.

The New Workhouse Hospital, Cheadle, Staffs, is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

The Rainham Cement and Brick Industries are just now suffering from the depression that is experienced in the building trade. The employees at the Rainham Cement Works have this week been put on three-quarter time, and the same shortage in the hours of labour has been effected in the brickfields.

Collapse of a House.—A furniture shop in Westgate Road, Newcastle, and the premises above, collapsed last week without the slightest warning. The adjoining house had been removed and the erection of a new building had been commenced, but the workmen had just left the job when the accident occurred. Only one man was slightly injured.

Wallpaper Manufacturers, Ltd.—At the annual meeting held last week a resolution was passed approving the balance sheet and report of the directors, and declaring a dividend of 8 per cent. for the year on the Ordinary shares. The sum of £30,000 is placed to reserve, and the balance of £25,776 carried forward to next year's account.

The Scottish Building Trades Federation (Perth and District) held its annual general meeting recently. Ex-Bailie Forgan, joiner, was appointed chairman, and Mr. William Johnston, builder, vice-chairman. The following were appointed members of the Executive:—Messrs. Alexander Beveridge, builder; Alexander Fraser, builder; William Mackay, plasterer; James M'Leish, plumber; Bailie Brand, builder; Donald Campbell, plasterer; Michael Kerrigan, builder; Councillor David Morrison, joiner; Bailie Watson, plumber; George Bell, slater. Messrs. Fraser, builder, and M'Quibban, joiner, were appointed auditors. Mr. James Mitchell, solicitor, was reappointed secretary and treasurer.

Architectural Lectures to Workmen.—At their last quarterly meeting the Building Branch of the Aberdeen Operative Masons and Granite-cutters' Union passed the following resolution: "That this branch appoint a special committee for the purpose of arranging and organizing a series of lectures upon architecture, sculpture, geology and kindred subjects, and further invite the monumental branch to appoint a similar committee to act along with them." In view of the fact that architectural jobs have within the last few years become a most important part of the work done in monumental yards, it has become more desirable than ever that every granite-cutter should have at least an elementary knowledge of architecture and the history and development of architectural design. Even in monumental work, architectural details have to be incorporated in almost every design. The first lecture was delivered last week by Miss Nora Macdonald on "The Manners and Customs of the Ancient Egyptians."

Quick Building.—A part of the store premises of Messrs. Harrods, Ltd., in the Brompton Road, London, has recently been demolished and reconstructed in a remarkably short space of time by the contractors, Messrs. T. Allen & Sons. The idea was to carry through the work in the "out-of-season" time, so as to be ready for the winter's trade; and by keeping the builder's men employed night and day, as well as by preparing some months in advance the various materials required in reconstruction, it has been possible to produce new shops and two storeys above them within the brief period of ten weeks, counting from the time the men began to build the foundations. Seven hundred workmen have been constantly engaged on the job. Three thousand tons of English steel, costing £24,000, have been used on the building, an additional 10ft. being thrown into the roadway (thus beginning a widening scheme which will be carried out in its entirety as the leases of the various buildings in the Brompton Road fall in).

London County Council.—At last week's meeting of the Council the question as to the amount of work done by the bricklayers was discussed (see p. 274 of this issue).—The Improvements Committee reported the receipt of a further communication from the First Commissioner of Works, which reduced the original plan of widening Piccadilly at the Green Park from Hyde Park Corner to Walsingham House, at a cost of £30,000, to a smaller scheme, estimated at £13,536, which would carry the improvement only as far east as Down Street or thereabouts. The report was adopted.—Mr. R. Williams asked if an Anglo-American syndicate had offered to take the site in the Strand being cleared in connection with the Holborn to the Strand street; whether the Improvements Committee had agreed to grant a 999 years' lease; and if it was intended to erect a building eleven storeys high. Mr. Davies said the Improvements Committee had received a letter, which had been passed on to the Corporate Property Committee.—The Asylums Committee submitted a supplemental estimate of £900 for the completion of the lining of a well on the Horton estate, necessitated by the inflow of polluted water. The dug portion of the well is 200ft. deep, and it is being lined throughout with iron cylinders. Up to the present the well has cost about £6,150. The estimate was approved.

BIRMINGHAM DENTAL HOSPITAL COMPETITION.

On Thursday, Friday and Saturday last the designs submitted for the new dental hospital at Birmingham were exhibited at the Council House. The hospital is to be erected on a site at the southern corner of the intersection of Great Charles Street by Church Street. Having first considered the selection of a site, the committee determined to invite five leading Birmingham architects to submit designs. Of these five two were unable to accept the invitation, so that the sets of designs exhibited are only three in number, and are the work of Messrs. Bateman & Bateman, W. H. Bidlake, and Ewen Harper & Brother. Messrs. William Henman and Thomas Cooper, who were retained as assessors, reported in favour of the design submitted under the initial Y, to which the committee agreed; and on the sealed envelope being opened it was found that Messrs. Bateman & Bateman were the authors of the design. The requirements of the hospital demand the solution of many difficult problems in planning; and while the assessors pay tribute to the skill evinced by all three competitors in their designs, each of which has its own particular merits, they go on to say that no one design contained such a perfect embodiment of the committee's wants as to avoid the necessity of some modification. The design of Messrs. Bateman & Bateman has been selected, therefore, on the broad lines of its showing marked advantages, and being the most readily capable of moulding into a thoroughly workable scheme. Its chief feature is its excellently devised filling-room on the third floor, with accommodation for fifty patients' chairs. The great aim has been to provide for the direct access of the patients to the suites of operating rooms and the filling-room, to secure workrooms and private-rooms for the staff, for the nurses, and for students in convenient proximity to, though suitably cut off from, the public part of the hospital, and to ensure ample light from the proper quarter, with good ventilation throughout. The perspective of the selected design shows a brick and stone building of Renaissance character, having the hospital entrance in the centre of the Church Street front. Shops yielding a considerable annual rental occupy the remainder of the ground floor, with the exception of a back entrance at the upper end of the Great Charles Street front. The hospital occupies such part of the basement as is not taken up by the shop basements, while its principal rooms are on the first, second and third floors, to which lift access is provided in connection with the principal staircase. The caretakers and other rooms are provided for on a fourth floor in the rear of the building, and will not be visible from the street.

BUILDING CONSTRUCTION.

(Continued from p. 252, No. 354.)

Beams (*continued*).

44. THERE is some advantage in taking in order of complexity a series of beams and applying to them some of the results of these articles on beams.

Fig. 56 shows a projecting beam fixed in a wall at A. The small weight of 20lbs. is hung at the outer end; the weight of the beam itself is not taken account of. The bending moment at any point is found by multiplying the distance in ft. of the point from the end of the beam by the weight 20lbs., so that it increases regularly. If a point C is taken so that BC = 200 on any scale, and a straight line CD is drawn, a line drawn from any point at right angles to the beam to meet this inclined line will give the bending moment in ft. lbs. at that point. The shear is the same at every point, and it is equal to 20lbs. It may help the student to think of any part of the beam measured from the projecting end as a rigid body in equilibrium under two couples—(*a*) a couple of which one force is 20lbs. and its arm the axis of the portion of beam considered: its other force is the *shear* at the point taken, which is 20lbs., because the two forces of a couple are equal; (*b*) the other couple is a compound one made up of all the stresses in the fibres above and below the neutral axis.

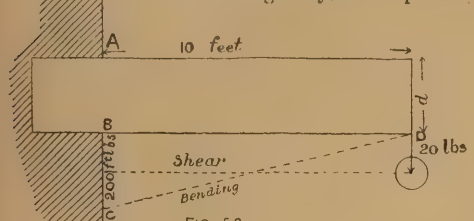

FIG 56

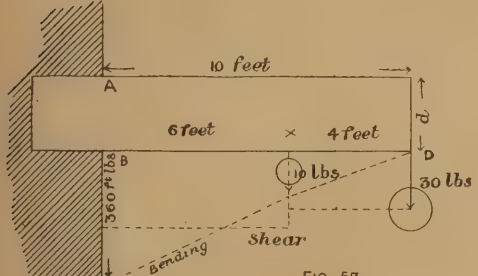

FIG. 57

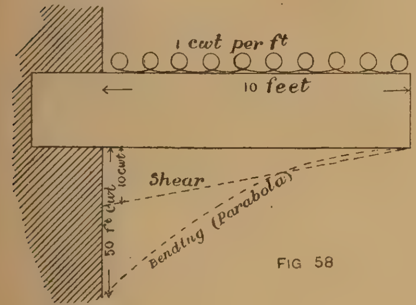

FIG 58

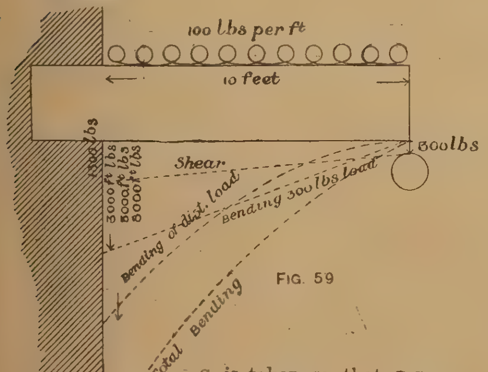

FIG. 59

Fig. 57 shows the same beam loaded at the end and at an intermediate point. If we consider, first, the 30lb. load, it can be dealt with as in Fig. 56: find a point at 300 and draw a straight line from this point to the end of the beam. Lines at right angles to the beam will by their intersection with this line give the bending moments at the points from which they are drawn; a further distance of 10 × 6 = 60 will give a point C, and if this point is joined to where the first line meets the vertical line where the 10lbs. is hung we shall have what we may call a compound line of bending moments. The shear for the first 4ft., measured from D, is 30lbs.; and for the remainder it is 40lbs., owing to the added 10lbs.

Fig. 58 shows the same beam with a uniformly-distributed load. This load may include the weight of the beam. The line of *shear* shows that the shear increases from the outer end towards the wall: it increases as the weight increases. The bending moment at any point is found by multiplying the sum of the weights between the point and the end by half the distance; if this is done for a number of points, and if lines are drawn at right angles to the beam at these points and made equal to the bending moments on some scale, the ends of these lines will be found to lie on a curve which may be drawn by joining the ends of the lines. This curve is known to be a parabola.

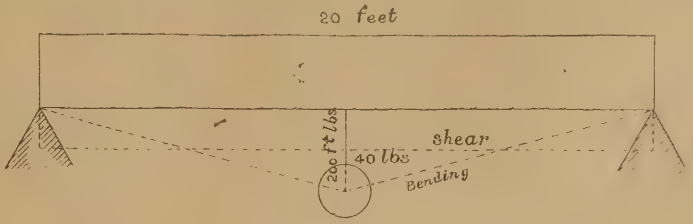

FIG. 60

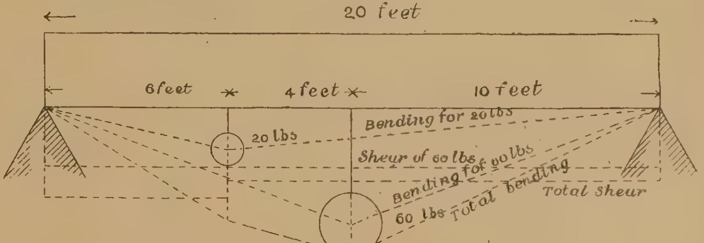

FIG 61

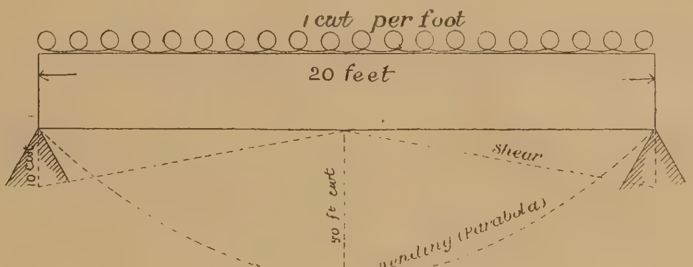

FIG 62

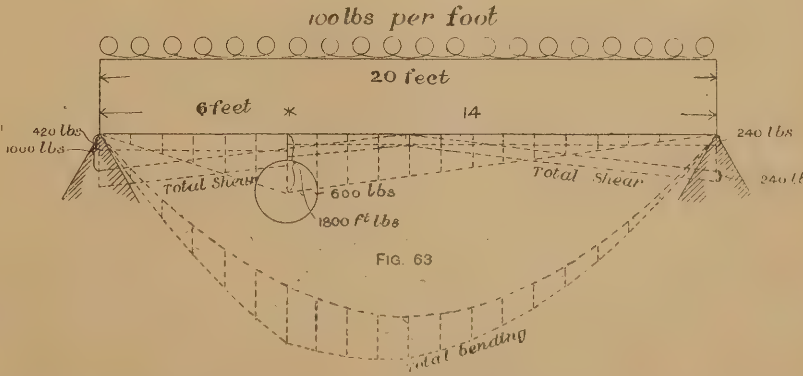

FIG. 63

Fig. 59 shows the same beam carrying both a distributed load and a load applied at the end. The curve marked "Total Bending" is found by adding the *ordinates* of the 300lb. load to those found for the distributed load curve *superposing*. (The lines drawn at right angles to the beam and terminated at the curve are *ordinates*. The student should know that ordinates are not necessarily at right angles to an axis.)

These diagrams are not to be taken as examples of real beams. The end said to be *fixed* in a wall is not to be taken as a workmanlike example of any such fixing. For any practical work the stability of the wall would be an important matter; the beam alone is here considered. The curves and lines show how the bending moment in all cases increases as we proceed from the outer end towards the wall and how in large *built* beams it will be safe to proportion the different parts to the duty they have to perform.

Fig. 60 shows a beam supported at both ends carrying a weight in the centre; Fig. 61 shows the same beam carrying two loads. The student will have no difficulty in seeing how the line of total shear and the line of total bending are drawn by *superposing* the separate lines found for the separate loads. Fig. 62 shows the same beam carrying a distributed load; and Fig. 63 shows a combined distributed load and a weight at a special point.

45. Fig. 64 shows two beams, one supposed to be fixed at one end and resting free at the other end, and the second fixed at both ends. I doubt if such conditions ever occur in practice; if they do occur, they are very rare and special cases. I shall have something to say about continuous beams later.

From Professor Unwin's "Elements of Machine

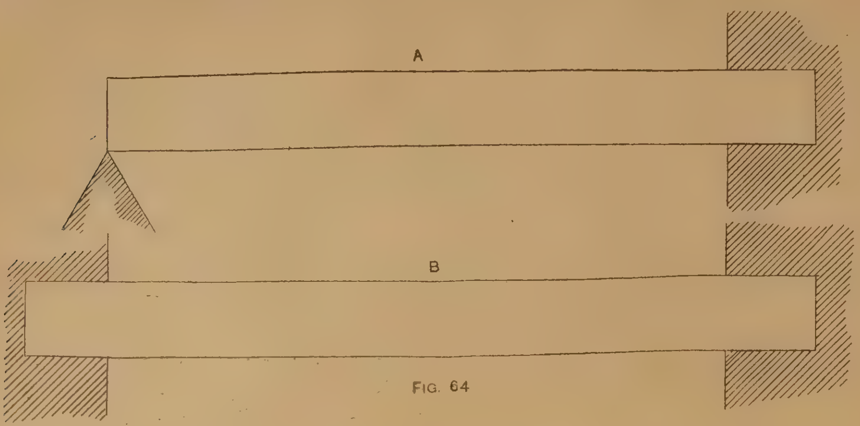

FIG. 64

Design" the beam A has for greatest bending moment (close to wall in which it is fixed) when loaded in the middle with a load W, $\frac{3}{16}$ Wl (l being the length of the beam). When loaded uniformly the greatest bending moment is at a point $\frac{5}{8}l$ from the fixed end, and $=\frac{wl^2}{8}$, where w is the load per ft. run. The beam B when loaded in the middle has a bending moment greatest at the walls, and $=\frac{Wl}{8}$; and when loaded uniformly the greatest bending moment is also at the walls and $=\frac{wl^2}{12}$.

46. *Diagram of bending moments.*—A B (Fig. 65) represents a beam resting with free ends at A and B; and p, q and r are loads resting upon it. Draw the diagram as shown. A T is the perpendicular of the triangle a P F; the triangle q O K is equiangular with a P F, and O H is its corresponding perpendicular, $\frac{AT}{PF}=\frac{OH}{KN}$ $\therefore$ A T . K N = O H . P F, where K N is the force upwards at A. In the same way, because U T is the perpendicular of the triangle V S F, and this triangle is equiangular with O W K, U T . p = O H . F S. But the moment at T is the difference of these moments; it is, therefore, O H (P F — F S) = O H . P S : O H is a constant, and therefore the bending moment is proportional to P S. If we have a suitable scale, any such line as P S intercepted between the string polygon and a b will by its length give the bending moment at any point such as T. To find the scale, produce a c and b c to intersect at c, draw c d at right angles to A B, cutting A B at X; now if the loads p, q and r were all concentrated at X the line d c would represent the bending moment. This bending moment is the upward force at A × A X = N K . A X;

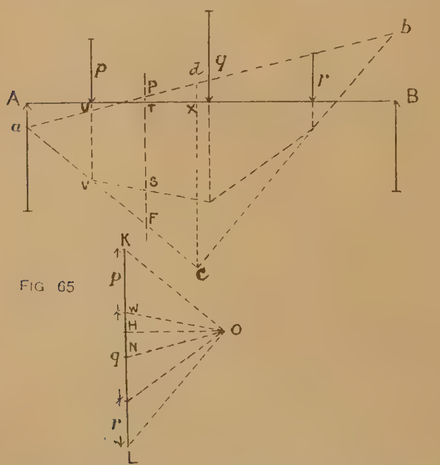

FIG 65

so that if the line d c is divided into equal divisions so as to represent the number standing for N K . A X it will serve for a scale to measure any such line as P S as bending moment at the place.

47. If the student remembers that the *shear* at any cross-section is the algebraic sum of the applied vertical forces to the right or left of the section, he will, knowing these forces, have no difficulty in determining the shear at any point. In regard to moving loads and providing for them it should be remembered that for practical purposes what is wanted is to determine the *maximum* stresses where they come, and what is their amount. In most cases it is easy to do this with the necessary accuracy by making a few diagrams of the moving load in different positions. The student should do this for himself. If he has followed these articles he will have no difficulty in dealing with any practical question in the strength and deflection of beams. Fig. 66 shows a bending moment diagram for a beam loaded irregularly. It would be more satisfactory for practical purposes if the point O had been taken closer to Q R, because this would have given what I may call greater *sag* to the string polygon.

Where beams carry walls the load is in most cases largely self-sustaining. Fig. 67 shows a section, and portion of elevation, of a lintel spanning a fairly wide opening (28ft.). A rolled joist is laid on its side; the wall over it is of cement-concrete; the bolts shown are put in position; the concrete is carefully packed about them; and when it has risen a sufficient height washers are put over the ends of the bolts and the nuts are tightened down. Such a lintel could be tied up through an arch, the arch and joist making between them a bowstring girder. I live in a region of very good building stone—mountain limestone—and among masons who are expert in building hammer-dressed rubble masonry. When such masonry is built with freshly-quarried clean stones well filled up with good Portland-cement mortar, the joints wide and the mortar coarse—*i.e.*, made with clean gravelly sand—I call the work "built concrete," because it differs from common rubble masonry. With masonry of this kind no arch is required, and the lintel may be put in as shown in the figure. In the case of a thin wall the joist is of use to give it stiffness transversely. There is no danger of trouble from expansion. When iron is in close contact with masonry the range of temperature is comparatively small. While speaking of this kind of building I may say that some years ago I designed a concrete water-tank, altogether above ground; a circular tower, 30ft. high and 20ft. internal diameter, strengthened with iron hoops which were placed close to the outside face in the concrete as the work was carried up; the concrete is only 2ft. thick; there is a heavy cornice, and the tank is covered on top—two or three hoops being let in here also. This work was carried out; it is watertight and apparently satisfactory in every way. In my practice I have a good deal of bridge-building, and I have built many small bridges having iron side-girders with a concrete platform between.

Continuous Girders.

48. Fig. 69 shows a continuous girder shown with exaggerated deflections. At the point (or cross-section) where the radius of curvature changes from one side to the other the curvature is nought, and where the curvature is nought there is no bending moment. There is only a shearing stress, and the girder may be cut into parts and placed as in Fig. 68. If the girder is of uniform cross-section the bending moment over the pier should equal the bending moment at the centre of the middle connecting lengths of girder a. Suppose the load to be uniformly distributed and of $w$lb. per ft. run, the bending moment at the middle point of a is $\frac{a^2w}{8}$.

The bending moment over $B=\frac{aw}{2}\cdot\frac{b}{2}+\frac{bw}{2}\cdot\frac{b}{4}$ $=\frac{w}{4}\left(\frac{b^2}{2}+ab\right)$, from which $\frac{a^2}{2}=\frac{b^2}{2}+ab$. $b = \cdot41a$. Suppose such a girder uniformly loaded arranged as in the figure (68), it will be in equilibrium, but the least inequality or want of uniformity of loading will upset the structure. If, however, the intermediate piers are not knife-edged as in the figure, but of the breadth c d, it is manifest that any moving load, in addition to the uniformly-distributed load, coming from A towards B will tend to bend b over c, and we have the moment of $bw\times\frac{cd}{2}$ to draw upon to maintain the stability of the structure. With flat-topped piers we see that we can afford to make the b pieces $=\cdot41a+$ the breadth of the pier. Where the rolling load is small compared to the fixed load this steadying moment may be quite enough, and the bridge may be constructed as suggested in Fig. 68. If the girder is continuous and rests on knife-edged piers the effect of a rolling load is to alter the positions of the points of no bending moment; and if the fixed load bears a very large ratio to the moving load, the change of position of points of no curvature (points of inflection) may not be very great. The investigation of this subject may be made as intricate as ever we please by choosing varieties of loads and by varying the cross-section of the girder to suit the maximum bending moments at various parts. The portions over the piers may be increased in spread, and they may be braced and strengthened till the structure becomes what is called a cantilever bridge. A general conclusion to be drawn is that there is great economy of material when a girder is made continuous over a number of piers, and this economy of girder material is to be measured against the cost of making the piers so that they can be relied upon not to "settle" in any way. There is no more risk in using continuous girders in bridges than there is in using masonry arches; in both cases we must be able to rely on the sufficiency of the foundations. A rail of railway "permanent way" is a most common form of continuous girder; and in this case both the foundations are yielding and the rolling load is enormous compared to the permanent load (the weight of the rail).

49. In the case of bridge girders, in providing for expansion, there is not the same objection to placing the girders on "rockers" that there is in the case of roof-trusses where we have no sufficient end obstruction. When a roof-truss rests in a short stirrup any side movement raises the centre of gravity, and when the stirrups hang "plumb" the condition is one of stable equilibrium; if instead of resting in a stirrup the truss rested on a "rocker"—the reverse of a stirrup—the equilibrium is unstable and an end force is needed. A bridge can easily be prevented moving endwise; and rockers such as a and b (Fig. 70), made fit to carry the weight as struts and able to act as ties (if a moving load requires a tie—as, say, at b, to help the permanent load to keep the girder down at b), are a perfectly good means of providing for expansion and contraction. I have repeatedly used the comparison between the moving load to the permanent load in connection with comparative permanence of stresses: long rockers give a means of making the weight of the piers help the permanent load to modify changes induced by moving loads, so as to almost prevent change of points of inflection. What do I mean by long rockers? The rockers I recommend should be fairly long, so that a slight movement will not appreciably lower the centre of gravity of the load; but as they are struts as well as ties, we shall see later that this will limit their length. They should be anchored well down in the masonry so as to be loaded to withstand any lift possible to come upon them. There is no need for them to be hinged; they can be formed to have enough flexibility at their ends to yield sufficiently to expansion movements in the continuous girder.

Suspension Principle.

50. We have seen that a string loaded with equal beads equally spaced hangs in a curve called a

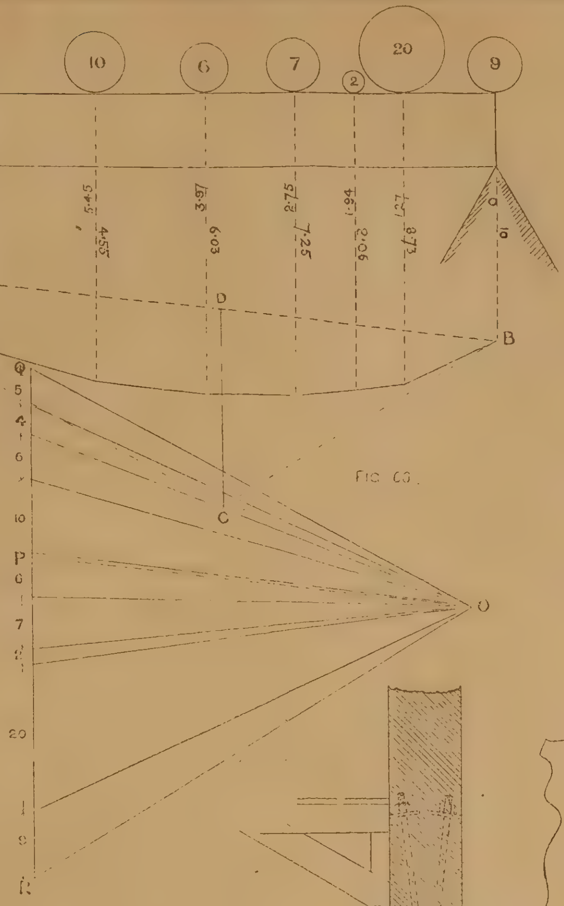

FIG. 66.

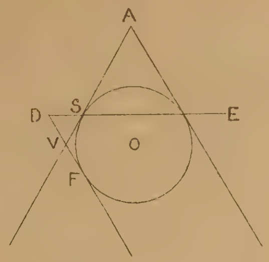

FIG. 71

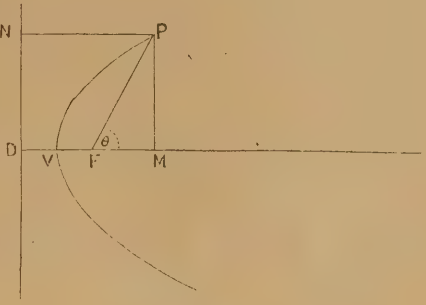

FIG. 72.

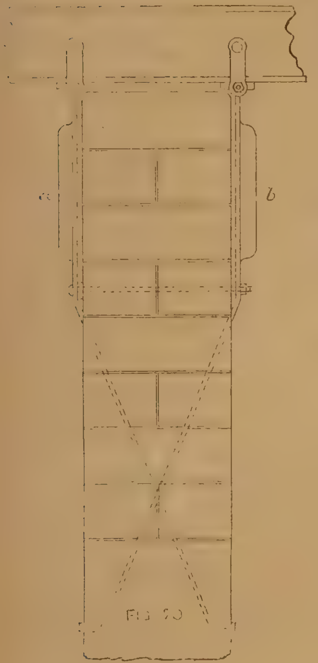

FIG. 70

FIG. 67

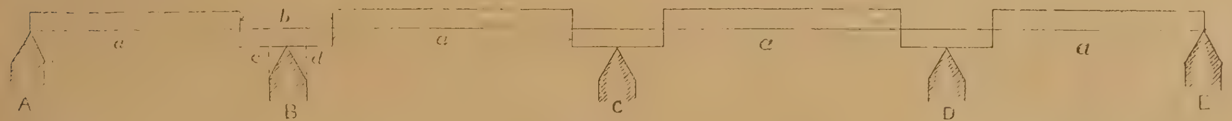

FIG. 68

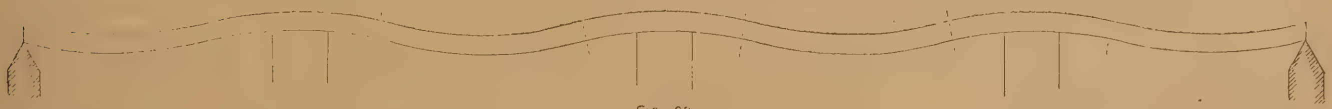

FIG. 69

catenary, or chain curve. The student has been told that the curve of bending moments of a beam loaded uniformly is a parabola; and he may infer that if the beads are spaced on the string so that when it is hung up and takes its curve the vertical lines through the centres of the beads are all equidistant, the curve is a parabola. To say that the first curve is a chain curve is merely repeating oneself, because the links of the chain are supposed to be equal in length and in weight, and they form both the beads and the string; but the idea of a parabola arises in a different way. If a right circular cone is cut by a plane parallel to the slant of the cone, the curved line where the cutting plane meets the surface of the cone is a parabola lying on the cutting plane. We can draw a parabola by drawing a plan and elevation of a right circular cone, assuming a cutting plane parallel to the slant of the cone, and finding (by descriptive geometry) points on the curve, and then rebating the cutting plane on the horizontal plane of projection. But we do not need to take all this trouble.

Fig. 71 shows the elevation of a cone whose vertex is A. O is a sphere placed in the cone so that it touches it in a circle lying in a plane represented on edge by the line D E. The plane whose cutting produces the parabola is shown on edge as D V F, and this plane touches the sphere at the point F. The two planes intersect in a straight line at right angles to the plane of the paper, and the point D is on this line. If we can take the plane represented on edge by the line D V F, and lay it down so as to lie in the paper (Fig. 72), we shall see the line D, the point V, and the point F, and with these points and the line given in position we can draw the curve. From Fig. 71: V S = V D = V F. Now the curve (Fig. 72) will be found to be such that a line drawn from F, as F P, to any point on the curve is equal to the distance of P, as P N, from the line N D, N D being at right angles to D F, and this is the law of the curve. Just as a circle may be defined as the locus of a point which moves so that its distance from a fixed point, the centre, is constant, a parabola may be defined to be the locus of a point which moves so that its distance from a fixed point (the focus F) shall be always equal to its distance from a fixed straight line (N D, the directrix).

Now (Fig. 72) $FP = DM = DF + FM = DF + FP \cos\theta$; that is, $FP = \rho = \dfrac{DF}{1 - \cos\theta}$, where DF is a constant, and this *equation* expresses the law of the curve. I have gone into this matter in the endeavour to interest junior students in such questions. Now the *equation* to the curve of the bending moments for uniformly-distributed loading of a beam can be got out from the loading conditions, and in this way it is identified as a parabola. We can see that when a string is loaded with a number of loads hanging vertically the stresses increase as we approach the points of support. We may consider the chains of a suspension bridge in the light we have from load diagrams of loaded strings.

51. We can make the string take any shape we please by our manner of loading it. In most suspension bridges there is a very great horizontal component in the pull of the chain where it meets the top of the pillar, and this is taken by the horizontal component of the stress in the chain between the top of the pillar and the anchorage. I give one illustration (Fig. 73) to show that if the loading of the chain is made so as to give it a semi-elliptical or semicircular curve, the chain may be made as nearly as ever we please, independent of anchorages. It will be seen from the diagram that for this kind of loading a thrust is put upon the girder carrying the roadway. The student must not infer from this diagram that I put it forward as a specially satisfactory form of suspension bridge.

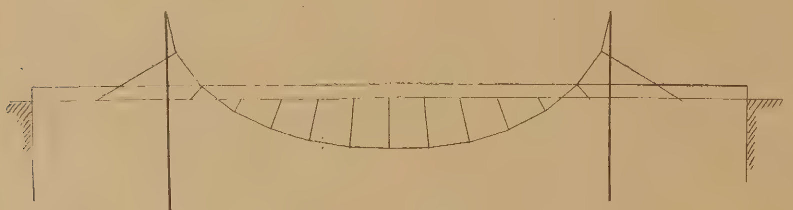
Struts.

52. In paragraph 20 (p. 185, October 23rd), in connection with the pressure of voussoirs carrying a load, I dealt with a matter which is important in this subject of struts. First, there is some difficulty in applying a pressure so that it will be uniformly distributed; and, second, I explained (Figs. 18, 19, 20) the rule that the "polygon should lie within the middle third of

the depth of the voussoir"; that if it did not lie within this region a tensile stress (or the need for strength to resist a tensile stress) would be shown at the joints. The effect of the line of centre of pressure being at the centre of gravity of the bearing surface of the voussoir, which suppose to be a rectangle, is to distribute the pressure (the stone being properly bedded) evenly over the surface; if it is to one side, that side has more to do than the other side; and we have found that when the centre of pressure is at the middle point of a line which is parallel to a side, and lying at a distance from that side of one-third of the breadth of the rectangle, the upper edge is just relieved from pressure. If we transfer our thoughts from the mutual pressure of two rectangular stone surfaces to a cross-section of an iron or wood strut sustaining an end pressure or stress, we can think of this centre of pressure going outside the middle third; some of the fibres are then in tension; we have a neutral axis, and the conditions bear comparison with those of a cross-section under bending. It is easy to see that this straying of the centre of pressure from the centres of gravity of cross-sections is greater at the middle of the strut than near the ends; that is, it is greater in long struts than in short struts, and it has a shorter range in the middle third of small cross-sections than in the middle third of large cross-sections. Every stress produces strain; the deformation of the strut sends the centre of pressure further from the centre of gravity of a cross-section, and if the stress is sufficiently great a "long" strut fails by cross breaking (partly crushing and partly tearing). (Students who have some knowledge of mathematics are referred to Professor Perry's "Practical Mechanics," pages 463–471. $P = \frac{EI\pi^2}{4l^2}$ (1) is *Euler's law of strength*, where P is the total pressure on the strut, E Young's modulus for the material, I the moment of inertia for the cross-section about the axis through its centre of gravity at right angles to the plane in which it most easily bends, and l the length of the strut. This formula applies to struts hinged or rounded at the ends, as A (Fig. 74). If a strut has flat ends (B, Fig. 74), it is prevented from bending at the end; and for such a strut Euler's formula is $P = \frac{EI\pi^2}{l^2}$ (2), which shows that a strut with flat ends may be twice as long for the same load as a strut with hinged ends. The assumptions on which these expressions have been arrived at are that the struts are straight and that the material is homogeneous, and these conditions cannot be absolutely counted upon in practice. A reliable formula for practical purposes is $P = \frac{pA}{1 + a\frac{l^2}{k^2}}$ (3), where P is the breaking load, p the breaking stress per unit of area for the material, l, the length of the strut, and k the least radius of gyration for the cross-section. (The moment of inertia being the sum of the products of each elemental area multiplied by the square of its distance from an axis, the radius of gyration is found by dividing the number representing the moment of inertia, I, by the number representing the area A, and extracting the square root $k = \sqrt{\frac{I}{A}}$. The moment of inertia of a mass about an axis is the sum of all the products found by multiplying each element or particle by the square of its distance from the axis; if we could imagine the whole mass concentrated in one point, the distance of this point from the axis is the radius of gyration. It gives some difficulty to have a mental picture of the radius of gyration of a mass: it involves the conception of mass without volume or size; but the student will fail to have any direct mental picture of the radius of gyration of an area about an axis.)

(3) may be written $P = \frac{pA}{1 + nB}$. p, n and B have been experimentally found and tabulated.

I take the following from Perry's "Applied Mechanics," pp. 468–469.



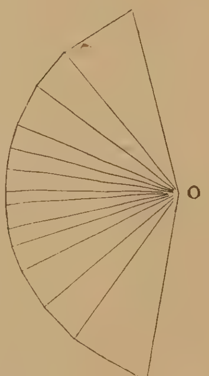


FIG. 73

TABLE XI.

(See Fig. 75.)

1. Square, of side $= d$; or rectangle with smallest side $= d$	$n = 1·00$
2. Hollow rectangle or square	$n = 0·50$
3. Solid circular section	$n = 1·33$
4. Ring section	$n = 0·66$
5. Cruciform section	$n = 2·00$
6. Angle	$n = 2·00$

(*To be continued.*)

MUNICIPAL UNDERTAKINGS.

A Comparison Between England and America.

IN the course of an address at the dinner recently given to him by the Municipal Trading Committee of the London Chamber of Commerce the Hon. Robert P. Porter, the United States Commissioner in Cuba, said America seemed to have been more successful than England in drawing the boundary line, as it were, between legitimate and illegitimate municipal undertakings. Rightly or wrongly, America had drawn that line on waterworks on the ground that the water-supply of a city was closely allied to its sanitary conditions. The tendency, he thought, was for cities to take over the waterworks, and there seemed to be no objection from any quarter. England, on the other hand, had dashed ahead along some lines that Americans would regard as extremely hazardous. Thus one was surprised to find the London County Council running omnibus lines, erecting small but expensive electric plants to supply limited areas of street lamps, building tramways, planning extensive subways from Westminster to the Bank; while the water-supply of the greatest modern city was in the hands of private companies. Looking over the entire field, he found that about half the capital invested in English tramways was owned by municipal authorities, about one-third of the capital in gasworks, by far the largest portion of the capital in electric-light plants, but only half the municipal boroughs of England seemed to own their own waterworks. In making fiscal comparisons between corporation and company undertakings attention should be directed to the estimate of the taxes which a municipalised city lost by owning and operating its own profit-making undertakings. Take, for example, the Brooklyn Rapid Transit Company, which was paying over £200,000 annually as taxes. It had worked up a big business in transportation, had consolidated smaller tramways, paid the city nearly £40,000 annually for the privilege of carrying passengers from New York free across the Brooklyn Bridge, and if they wished would carry one twenty-two miles at good speed for the modest fare of 5c. (2½d.). Then, again, they had the Metropolitan Street Railway of New York carrying nearly 200,000,000 passengers on transfers free of cost—£2,000,000 thrown away, some people contend. The Union Traction Company of Philadelphia had made an estimate of their taxes, and, including the cost of the maintenance of paving, removal of snow and ice, and the interest on the original £2,800,000, and the cost of improved pavements laid by the company at the time the franchise was granted, this aggregated over £400,000 annually.

Keystones.

Change of Address.—Mr. Joseph Berry, architect, surveyor and valuer, has removed to 3, Market Place, Huddersfield.

A New Wesleyan Chapel at Newport, I.W., is being erected at Hunnyhill. The new building will be of red bricks with slated roof. Mr. S. E. Tomkins, of Newport, is the architect, and Messrs. G. Ball & Son are the contractors.

Workmen's Dwellings in Bermondsey.—The Bermondsey Borough Council propose to purchase for £25,000 the site of Messrs. Bryan, Donkin & Co.'s engineering works, Southwark Park Road, and erect blocks of workmen's dwellings at a cost of £30,200. The plans provide for 400 rooms, comprising forty three-roomed houses and 140 two-roomed dwellings.

The New Church of the Ascension at Stirchley has recently been consecrated. It is in the Decorated Gothic style, built of red bricks, with Bath stone dressings, and provides accommodation for over six hundred persons. The chancel has a waggon-shaped roof, and the choir vestry occupies the base of the tower on the south side, the organ-chamber being above. At the west end of the church is an apsidal baptistery. The total cost of the church and organ was £8,400. It is in this district that Mr. Cadbury's model village has been built, which to some extent accounts for the rapid increase in the number of residents.

A New Wesleyan Church at West Bridgford has been erected. It accommodates 300 persons. The entrance directly fronts on Trent Boulevard, the face being of Coxbench stone with Hollington stone dressings, the remainder of the structure being of pressed bricks. The edifice, which has cost about £2,000, has a length of 58ft. and a breadth of 31ft. The style is Perpendicular Gothic, with a large tracery window, and an entrance porch. A roof on the hammer-beam principle has been adopted. The whole of the woodwork, including the pews and roof, is of Canadian pine, and the heating is by hot water on the low-pressure system. At the rear is a church parlour, with classrooms overhead. Mr. A. E. Lambert was the architect, Mr. T. Barlow the contractor.

The Glasgow Technical College Architectural Craftsmen's Society held a meeting on Friday, November 22nd, Mr. John McKissack in the chair, when a paper entitled "Foreign Competition in the Building Trades" was read by Mr. George Herbertson, measurer. The essayist held that the restrictions put by the combined action of workmen on the importation of foreign-made joinery finishings and the like was contrary to the spirit of free trade which is the policy of this country. He suggested that for rolled steel beams and Portland cement a certain standard should be specified, and let the material come from where it might. He deprecated the proposed boycotting by slate-quarry masters in their attempt to keep out foreign slates. A discussion followed, opened by Mr. John Fairweather, A.R.I.B.A.

The Proposed New Buildings at Edinburgh Castle.—The Council of the Edinburgh Architectural Association have had under discussion the designs of these buildings, recently exhibited in the City Chambers. After having inspected the plans, the site and the probable effect from various points of view, and having fully considered the question, they resolved as follows: "The Council desires to express its sense of the courtesy of the War Office in giving the citizens an opportunity of seeing and discussing what is proposed to be erected on a site so unique in position as Edinburgh Castle. The Council feels most strongly that a site of its commanding position demands the most careful and skilful consideration, and although it is evident that no little attention has been directed to the preparation of the designs, the Council observes with great regret that from any point of view the outline of the great mass of the Castle and its buildings will be disfigured; and, further, that the general designs do not commend themselves as being in harmony with the better work on the Castle Rock. The Council trusts that, as this question is one of very great and permanent importance, nothing will be done without further serious consideration."

The Organ of St. Stephen's, Walbrook, closed since August for repairs and extension, has been reopened.

A New Church at Ilfracombe is proposed to be erected on the site of the present St. Peter's from plans by Mr. G. H. Fellowes Prynne.

Hogarth's House, Chiswick, together with about half an acre of garden attached, was sold by auction at the mart last week by Messrs. T. H. Currie & Co. for £1,500. It was built about 200 years ago, and occupied by William Hogarth from 1749 to 1764.

Mr. Walter Crane and Mr. Anning Bell have been invited to superintend the arrangement of the British section at the forthcoming Exhibition of Arts and Crafts in Turin. Eager as the Italians have shown themselves of late for exhibitions, this is a new departure on their part, and British decorative work should be represented to the best advantage.

A New Wesleyan Chapel and Schools at Worcester is being erected in Pump Street. The school buildings will be placed at the rear and will include an assembly-room and five classrooms, vestries and a ladies' parlour. The total outlay is estimated at £8,000. The architect is Mr. Jameson Green, of Liverpool, and the contractors are Messrs. Hopkins & Son, of Birmingham.

A New London Board School at Gospel Oak has been erected in Mansfield Road. It has been built on an exceptionally favourable site, being separated only by a railway from Parliament Hill Fields, which are over 300 acres in extent. The site was acquired sixteen years ago, and the immediate neighbourhood has in the meantime been covered with houses, one of the factors in the development of the district being the establishment of large engineering works in connection with the Midland Railway. The school will accommodate 800 children.

Leighton House.—At a recent meeting of the Kensington Borough Council the Libraries Committee brought up their report in reference to Leighton House. After some discussion the recommendation of the committee:—"That the council do consent, subject to satisfactory arrangements being made for the acquisition of the freehold as well as the leasehold interest, to take over the Leighton House and grounds on the terms laid down by the owners of the property, and that it be referred back to the committee to continue their negotiations on this basis"—was carried.

The Proposed Liverpool Cathedral.—At a meeting in aid of the Liverpool Cathedral fund, held at the Childwall Rural Deneary, Mr. Robert Gladstone, as representative of the Diocesan Committee, said that as to the style of architecture the committee were unanimously in favour of Gothic, but they had consented that the matter should remain open, and if the architects of England could create a new style and produce something more beautiful the committee would be pleased. It was stated that a Bill would be introduced in Parliament authorising the purchase of the selected site and also of the advowson of the rectory of Liverpool.

The Empire Music Hall, Swansea, in High Street, has just undergone extensive alterations for the Swansea Improvements and Tramways Company, and the hall will be reopened shortly under the name of "Palace of Varieties." New exits and entrances have been provided to each part of the house; sanitary arrangements have been renewed, verandahs have been fixed over all entrances, and the whole of the building, including bars, has been redecorated and refurnished. Electric light has been installed so that the building is up to date in every respect, and the safety and comfort of the public have been specially considered. The system of ventilation has been changed and a large motor fan substituted which will extract all smoke and foul air from the hall in a few minutes. The seating accommodation is about 600. The contractors for the work were: Messrs. J. & T. Weaver for the structural alterations, Mr. W. Evans for decorations, Mr. H. Coles for electric lighting, and the Domestic Supply Co. for the furnishing. The architects for the alterations were Messrs. Bucknall & Ellis, of Swansea, from whose plans the building was erected in 1887. The cost of the present alterations is about £4,000.

Battle Abbey Estate was sold last week to Sir Augustus Frederick Walpole Webster for £200,000.

The Cardiff, South Wales and Monmouthshire Architects' Society.—The meeting reported on p. 266 of our last issue was of the Associate (or Student) members of this Society.

Mr. C. J. Innocent, F.R.I.B.A., F.S.I., has taken into partnership his son, Mr. Charles Frederick Innocent, who has been associated with him several years. He is an associate of the Royal Institute of British Architects, having passed its final examination in 1896.

St. Andrew's Church, Bromley-by-Bow, is in need of gates to protect the outer doors of the church in a very rough locality (the handles having been wrenched off and other damage done), and £40 is required. Another £160 is needed to enlarge the present small and inadequate organ.

Dover Hospital is being extended as a local memorial to Queen Victoria. The work to be carried out includes a new out-patients' department, an isolation block and an operating theatre. The operating theatre is being built as the town's memorial to the late Sir Richard Dickeson, for many years president of the hospital.

The View from Richmond Hill: Middlesex County Council Object.—At a meeting of the Middlesex County Council held last week a resolution was passed that the proposal that the Council should contribute £12,000 towards the purchase of the Marble Hill estate was unacceptable, and that four members should be appointed to enquire into the best means for preserving the view from Richmond Hill.

A Discovery in Jerusalem.—The Greek Catholic monks, who are in possession of the chief portions of the Church of the Holy Sepulchre, are building a bazaar opposite it, where pilgrims may purchase souvenirs of their visit to Jerusalem. During the process of clearing the site the foundations of an old mediæval church, forty mètres long and thirty wide, with three apses, were discovered. A number of fine capitals, fragments of basalt pillars, and bas-reliefs, with symbolic animals, were found, all these remains having doubtless belonged to the choir of the church.

The Edinburgh Architectural Association held a meeting last Thursday, Mr. Henry F. Kerr, president, in the chair. Mr. Louis A. Barnier, B.A., delivered a lecture on "The Old Monuments of Provence," showing how the influence of Greek and Roman civilization began earlier and finished later than in the rest of the Gaul, and therefore left a stronger mark on the people, who have ever since preserved an individuality, and have been, so to speak, a nation apart from the rest of the French. Some of the monuments, Roman theatres, amphitheatres, temples, mausoleums, &c., in the following towns were specially mentioned: Orange, Avignon, Tarascon, and Beaucaire, Arles, Aignes, Mortis, Carcassone, and Nimes.

Statue to Queen Victoria at Hull.—The Hull Queen's Memorial Committee has unanimously selected the joint design for the Queen's memorial in the new City Square by Mr. H. C. Fabr, sculptor, and Mr. J. S. Gibson, architect, London, after the various models submitted for its consideration had been inspected. The design consists of a figure of the late Queen, 9ft. in height, clad in State robes, upon a pedestal, on each side of which is a figurative group of statuary illustrating Great Britain and the Mistress of the Seas and her dominion over land. Round the frieze of the pedestal will be an inscription of her Majesty's titles, while on the panels at the back and front in bas relief will be a symbolical old-world galleon and an ancient Greenland ship, whilst on the four corners of the pedestal are dolphins and over the cornice a representation of the city arms. The statuary and enrichment will be in bronze and the pedestal figures in Portland stone. The cost of the statue, apart from foundations, will be £2,700. The memorial, including the pedestal, will cost something like £3,000. The work it is expected will be completed by August next. The total height of the statue from the flag level will be 30ft., and cover at its base a space of 25ft. by 20ft.

The Exhibition of the Queen Victoria Memorial Designs at St. James's Palace will be closed after Saturday, December 7th.

Mr. Edward Forrest, an architect, in Douglas, died last week from a severe cut in the throat' evidently self-inflicted with a razor that was by his side.

Mr. Walter Long, President of the Local Government Board, received a deputation last week from the Association of Municipal Corporations. In reply to Sir A. K. Rollit, he said that, if the time for the repayment of loans were extended from forty to sixty years, there was not sufficient evidence to show that the rents would be brought within the reach of the very poor. He was hoping that some such evidence would be sent to him.

The Victoria Station Hotel, Nottingham, was opened recently. It has been built in connection with the Central Station, jointly owned by the Great Northern and Great Central Railway Companies, and has been designed by Colonel R. W. Edis. It is built of red bricks with stone dressings, surmounted by a lofty tower with tapering spire. On the ground floor the hotel has a central hall, with reception and business rooms on the one hand, whilst on the other hand access is obtained to a lounge, coffee-rooms, a smoking-room, reading-room and buffet. The billiard room is on a lower floor, and on the same level is the domestic department. From the ground floor a grand staircase leads to the upper floors, which are also reached by an electric lift. The building has been built, fitted and appointed throughout by Messrs. Maple & Co., Ltd.

Masters and Men.

Trade Unions and Free Labour.—An important judgment was given in the Philadelphia Courts last week in a case involving the question of the legal right of trade unions to compel contractors to employ only union labour. The council of the Allied Building Trades, a prominent labour organisation of the United States, had compelled certain contractors to discharge some plumbers who were not connected with that society under a threat of ordering a strike of the members of the Allied Building Trades. An injunction was applied for, and the Court has made an order restraining trade unions from ordering contractors to discharge members of societies not affiliated with the Allied Building Trades. The judgment also restrains officials of the latter organisation from approaching buildings where mixed labour is employed for the purpose of interfering with the contractor's arrangements.

Engineering Notes.

The New Chapel and School at Summerhill, near Wrexham, have lately been fitted with the well-known "Small Tube" hot-water heating apparatus by Messrs. John King, Ltd., engineers, Liverpool.

The Brighton Corporation Electric Tramways were opened recently. They have been laid down on the overhead trolley system at a cost of £175,000, and practically cover the borough from the Pavilion northwards. There are four sections, known as the Lewes Road, Elm Grove, Ditchling Road and New England Road routes, but only the first-named has been opened. It is anticipated, however, that the whole system will be in use within a week.

Electric Railways to Brighton.—Major Cardew and Mr. Philip Dawson have been retained as consulting electrical engineers to the London, Brighton and South Coast Railway Company. Though the company does not contemplate the promotion of a Bill in Parliament for the conversion of the line to an electric railway in the immediate future, the appointment has been made with that end in view. The company has already considerable electric works of other kinds. Also expert advice is desirable in regard to what the general manager calls "fantastic" schemes of electrical traction to Brighton which may come before Parliament. Mr. W. Emden, L.C.C., is preparing designs for the terminus at Brighton of the proposed Brighton Electric Railway.

Trade and Craft.

Geysers.

A new illustrated catalogue of geysers and instantaneous water-heating appliances has been issued by Messrs. Ewart & Son, Ltd., of 346, 348 and 350, Euston Road, London, N.W. On pp. 12 to 15 is illustrated the "Califont" geyser, which is their most important novelty. It instantly supplies hot water under high pressure, without circulation, if desired feeding a tap above or below the level of the apparatus and at any distance, with a flow of water averaging from 1 to 8 gallons per minute. This geyser gives an adequate hot-water service to any number of taps. On pp. 2 and 3 the "Lightning" geyser is shown. To the usual stock sizes larger ones have been added, rapidly heating water in big quantities for baptistries, factories, &c. On p. 6 a convenient combination of geyser with shower-bath arrangement and lavatory supply is illustrated. The "Champion" geysers, sizes "X" and "Z," are very powerful inexpensive heaters, useful for bottle washing, laundries, &c. Page 23 illustrates a satisfactory and reliable geyser heated by oil, for which there are many enquiries. The "Success" geyser has been on the market for a few years, but has recently been improved. The "Bar" geyser (p. 30) shows a new departure in water-heating. Special arrangements are made for the easy removal of fur deposited by boiling water, and a patent controlling valve is provided by which a supply of boiling water is always maintained for restaurant use or tea-making purposes. On p. 31 is illustrated the "Albany" gas circulating boiler for connection with radiators, greenhouse pipes, &c. On p. 27 information and a sketch are given showing how to deal with the trouble which takes place in vent pipes, caused by downdraught; and some interesting bathroom sundries and fittings are shown on pp. 28 and 40.

Vulcanite Roofing.

The Patent Vulcanite Roofing and Asphalte Co., Ltd., of 2, New Union Street, London, E., draw attention to the following information regarding their patent roofing, which takes the place of asphalt, copper, lead or zinc. When completed it is entirely one flat surface, without seam or joint, requiring no drips or rolls; and, moreover, it is cheaper and more fireproof than slated or tiled roofs, and is perfectly waterproof and dustproof. Its efficiency is testified by the fact that it is now used by the War Office and the Admiralty, after the strictest examination by the Government surveyors. The following are the principal advantages of vulcanite roofing: The roof being arranged in an almost horizontal position, the area is reduced to the least possible extent, affording a great saving in the outlay on timber and wages. The boarding may also be used as a ceiling, still giving good rooms immediately under the roof. The construction is not only simple but adapts itself easily to the most complicated forms of ground plan, and the vulcanite roofing is also particularly suitable for the tops of Mansard roofs. It is claimed that the temperature in the rooms beneath a vulcanite roof is in summer and winter more even than under any other roof; and the material being bituminous, horn-like and elastic, while retaining its elasticity permanently, becomes in course of time of a metallic hardness and is absolutely impervious. It is a fire-resisting roofing of the first order, because the layer of gravel or soil is a protection against any burning objects and the hermetically-closed roof offers the greatest possible resistance to the spread of a fire, as it stifles the flames. Possessing these advantages, it demands inspection by all architects. Some time ago an appeal case was heard before Mr. Justice Grantham and Mr. Justice Channel in which the question was raised as to whether vulcanite roofing was incombustible within the meaning of the London Building Act. The justices of Edgware decided that the material was more fire-resisting than slates, metal, &c., and Mr. Justice Graham upheld this decision. The compliance of the patent vulcanite roofing material with the building by-laws is thus established, as no further appeal against this judgment is possible.

ANCIENT LIGHTS.

Mr. LEIGH CLARE pointed out in a recent lecture on "Some Points in the Law of Prescription," delivered in the Inner Temple Hall, that prescription is one of the oldest branches of the law, and goes as far back as legal memory can go. It is based on the principle that, when a man has exercised openly and for a long time without dispute any particular right, the law assumes that his action is rightful and not wrongful. Broadly speaking, this is a very wise and just principle, but, like all other general laws, it is inevitably open to some abuse. Mr. Leigh Clare asserts that its greatest defect arises in connection with ancient lights. The great drawback to the operation of this law is that in some cases the right to light is used out of all proportion to the value of the light which is claimed. Mr. Clare's opinion is that the courts should be invested with the power of saying that where the inconvenience and loss to the owner of an ancient light is infinitesimal compared with the injury which the exercise of the right would inflict, either upon a neighbour or the general public, it was a question of compensation and not, as at present, of injunction. Mr. Clare would have Parliament interfere in this matter, and impose upon our legislators the task of finding a remedy for what is sometimes an injustice. Sir Francis Jeune, however, is not so confident of Parliament finding a remedy or of the wisdom of leaving the subject to the Legislature.

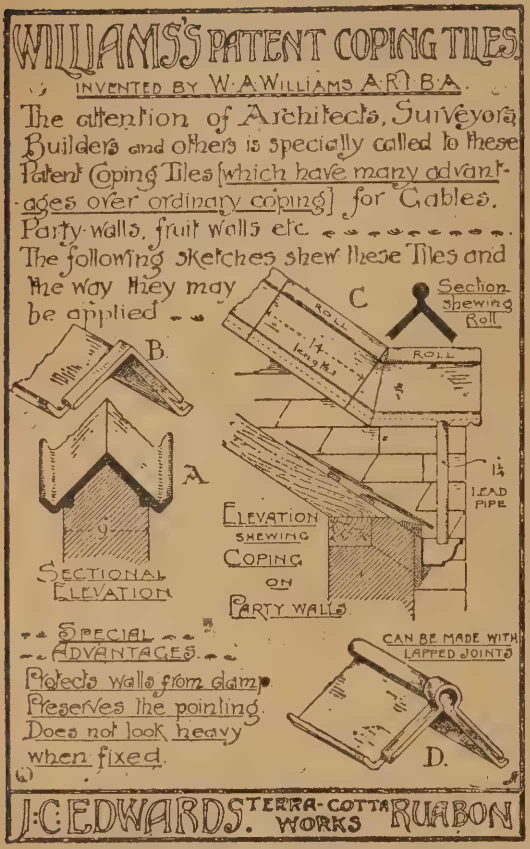
IMPROVED COPING TILE

(PATENTED)

For GABLES, PARTY WALLS, &c.



WILLIAMS'S PATENT COPING TILES.

INVENTED BY W. A. WILLIAMS A.R.I.B.A.

The attention of Architects, Surveyors, Builders and others is specially called to these Patent Coping Tiles [which have many advantages over ordinary coping] for Gables, Party-walls, fruit walls etc.

The following sketches shew these Tiles and the way they may be applied.

SPECIAL ADVANTAGES.

Protects walls from damp.
Preserves the pointing.
Does not look heavy when fixed.

J. C. EDWARDS. TERRA-COTTA WORKS RUABON

This Coping prevents the water collected by it from running down and soaking into the wall beneath.

The end tile is provided with outlets, from which the water can be conducted to the eaves gutter or elsewhere by a small lead pipe, or the outlet holes can be omitted, the tile throated and set to let the water shoot clear of the building, but the pipe is recommended and the expense is trifling.

It can be used as well on the flat, as raking, for with a little care it can always be laid to a slight fall, the outlets then should not be more than 10 feet apart.

The Tiles are set and jointed in cement, the edges being scratched up rough to form a key, making a permanent and water-tight joint.

It will be seen that with these Copings the walls are protected from dampness, pointing preserved, rooms in roof kept dry, and defective flashings and fillets do not cause so much leakage. No other ordinary Coping answers the same purpose.

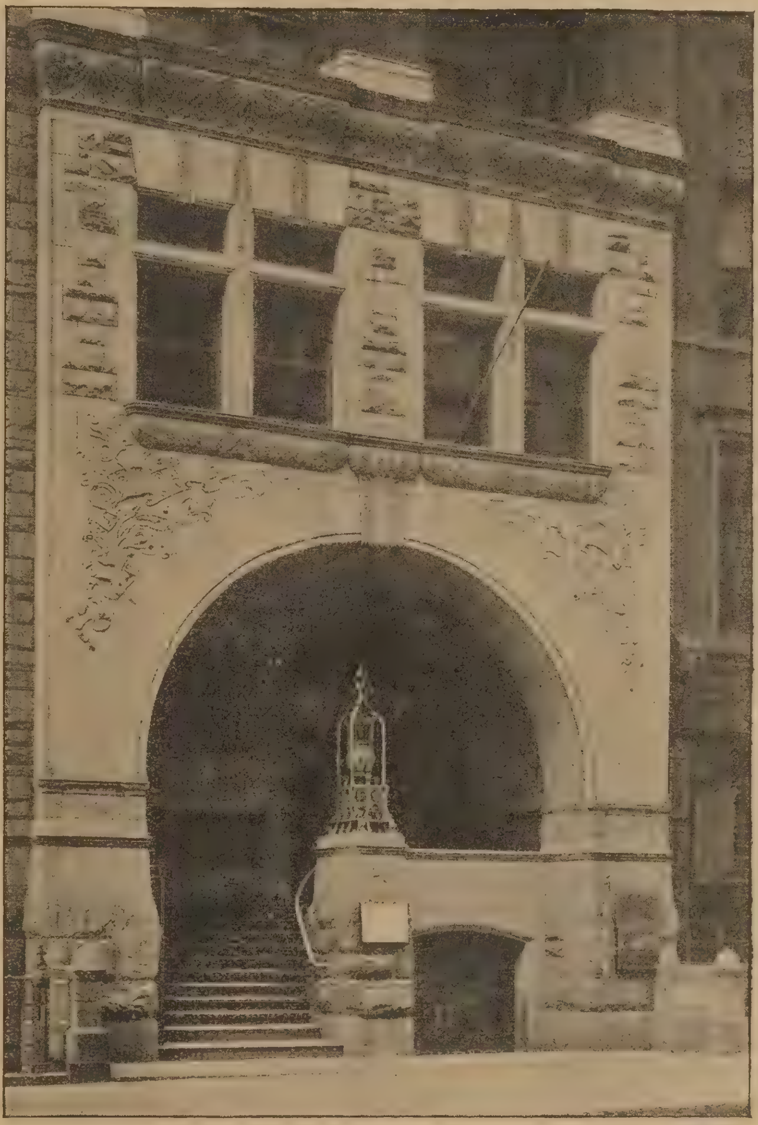
An Architectural Causerie.

A Weak Defence. THE smallest things sometimes furnish a clue to the greatest mysteries, and so it happens that when Mr. Akers-Douglas, First Commissioner of Works of His Majesty's Government, brings forward as proof of Mr. Henry Tanner's eminence as an architect the fact that he is a F.R.I.B.A. and won the Tite prize in 1878—we are inclined to think that the First Commissioner knows very little about the practice of architecture in this country to-day: and we feel rather sorry for Mr. Tanner himself, who, we are sure, would wish that something less ridiculous had been said about him. If it were not for Mr. Leonard Stokes, this controversy might be very one-sided, because so much depends on the exact state in which the drawings were left by Mr. Brydon, and as these have been in Mr. Akers-Douglas's possession for some time past we should not have been able to know the exact truth about them; for it is not probable that, without such bullying, the First Commissioner would have made the generous offer to exhibit the drawings in support of his action. However, Mr. Stokes, as one of the executors, happens to have had the drawings in his possession before they went to the Office of Works, and he has several times asserted that they were very incomplete, and, what details there were, hurriedly done. We do not accuse Mr. Akers-Douglas of dealing obstinately in this matter, for we feel sure he is desirous of securing the best results in the circumstances, but there are certainly two or three practising architects who are more capable of finishing Brydon's work than the Office of Works; and as to the question of an outside architect subordinating "his own inventive genius to that of the original designer," we never heard at the time when Mr. Brydon's design was first exhibited that it was such an immaculate work of art and that the creator of it was the apotheosis of architecture which Mr. Akers-Douglas apparently supposes he was: and if every little scratch he made when the Office of Works was hurrying him to get out the drawings for the contract is to be considered sacred, we certainly shall not have the building as Brydon himself would have built it. Rather, the incompleteness of these drawings demands that the hurried details shall be dealt with by a trustful hand, and we might name one architect especially who would be quite as sympathetic in his treatment as Mr. Henry Tanner. But we lose faith in the official sympathy, which Mr. Akers-Douglas is so confident he has secured, when we hear that, as a commencement, the sloping roofs of Brydon's design have been swept clean away and replaced by flat asphalted ones!

Mr. Holiday's New Reredos. IT is well known that owing to one circumstance or another—such as deficient lighting of the chancel, lack of convenient size in the panel spaces, or the blinding quality of the glass in the window over the altar—painting is generally ineffective as the principal part of a reredos. Indeed, an ordinary painting on panel or canvas in such a position is generally quite invisible 30ft. away. To remedy this defect many expedients have been adopted, such as gilding the ground, thus emphasizing the silhouette of the subject, making use of relief with the addition of colour, raising parts of the surface with gesso, &c.; and to most of these processes some objection, either æsthetic or practical, has been taken. The problem as to the absolute best still awaits solution, and yet another attempt has lately been made by Mr. Henry Holiday to solve it by combining enamel with relief, a material hitherto only used for small surfaces, at least in connection with serious art. Notwithstanding the richness and depth of colour obtainable by the use of enamel, the smooth and shining surface which it presents is quite unsuitable for large decorative work, and it is with the object of retaining the glow of colour while breaking up the surface that Mr. Holiday has made his experiments. He is now at work upon a reredos for the church of the Holy Trinity, Edinburgh, the centre panel of which is 7ft. high by about 2ft. 6in. wide, and the two side ones 5ft. by 2ft., which is an example of this fresh process. The central panel is finished, and some idea of the final effect may be gained from it, though the lighting of a studio is so different from that of a church that surprises are not unlikely. The subject is the "Crucifixion," and the side panels will be filled with "The Agony in the Garden" and "Christ bearing His Cross" respectively. The cross rears itself to the top of the panel against a dark blue sky in which the sun and moon are set, dull blood red; below, it is gashed with bars of light, against which the dark blue hills and the very successfully suggested town stand in solemn colour. The pale figure of the Christ is sustained by cords bound about his body in the manner suggested by J. J. Tissot in his drawings of the Passion. The figures of the Virgin, the Magdalene and St. John are in brighter colours—pale blues, crimsons, greens, purples and golden browns with some admixture of white. The design is modelled in low relief and the plates of silver or copper for each part (for the surface is cut up into many sections) are *repoussé* to fit the casting from the model; they are then coated with enamel colours and fired, some once, most of them twice, some even three times. The moulds are useful in the furnace to support the metal, which, being thin, would otherwise lose its shape in the great heat. The mixture of transparent and opaque enamels gives great opportunity for variety of effect, and beauty of colour is easily obtainable after a little practice. The several pieces are stuck down upon a shaped matrix with cement, the backs being made rough and coated thinly with enamel so as to ensure adhesion; but whether this will prove effectual time will show. Mr. Holiday has also in hand a wall panel for the chapel of Aysgarth School in Yorkshire. The subject is "The Carpenter's Shop," and the process used is the same. In this



ENTRANCE TO ALDRICH COURT, 45, BROADWAY, NEW YORK. CABLE AND YOUNG, ARCHITECTS.

GENERAL VIEW OF CAUDEBEC-EN-CAUX FROM THE LEFT BANK OF THE SEINE.

case it is proposed to add a frame in which a good deal of mosaic will be used, and it will be interesting to see how the materials will unite. The enamel colours are most of them made in the studio, or at least in a room opening from it, and Mr. Holiday has also been making pot metal for stained-glass windows, in which he has attained considerable success, as may be seen in a window now in his studio in which some very beautiful greens, blues and purples are introduced. The window is for a church in New York, and the figures of St. Paul, St. Stephen and Phebe are set beneath elaborate canopies of fourteenth-century style. The backgrounds are blue and ruby, counterchanged. This window is one of the most satisfactory which has come from Mr. Holiday's hand. A. W.

R.I.B.A.

THE following were elected members of the Royal Institute of British Architects at the last meeting:—

As Fellows—B. E. Baily (Nottingham), John Begg (Bombay), J. Cash (Oxford Street, W.), H. E. Farmer (Walsall), Henri Favarger (Cairo), J. H. W. Hickton (Walsall), F. E. Masey (Cape Town), M. B. Price (Pietermaritzburg).

As Associates—T. W. Aldwinckle (London, S.E.), H. Allberry (Dublin), J. P. Bishop (London, W.), C. H. E. Bridgen (London, W.C.), H. Cayley, M. A. (London, S.W.), F. D. Clapham (Eltham, Kent), W. B. Dawson (London, S.W.), H. D. Day (Godalming), W. M. Dean (London, W.C.), L. G. Detmar (Sutton, Surrey), T. N. Dinwiddy (Greenwich), L. W. Ensor (Sheffield), K. Gammell (London, W.C.), L. C. Gregory (London, W.C.), C. Ll. Hall (Blackburn), J. P. Hall (London, W.), S. J. Halse (Canterbury), G. R. C. Harding (Lincoln), A. Holstead (Alnwick), E. V. King (South Shields), A. G. R. Mackenzie (London, W.C.), E. G. Page (London, W.C.), A. Pickup (Blackpool), L. E. Pryke (Summers Town, S.W.), E. J. Pullar (London, S.W.), A. H. Roe (Forest Gate, E.), R. B. Rowell (Colchester), C. Stretton (Leicester), J. G. Walker (London, N.W.), R. C. Wrinch (Ipswich).

As Hon. Corresponding members—Señor don Enrique Mariá Repulles Y Vargas, President, Central Society of Spanish Architects (Madrid), Senor don M. Alberto de Palacio (Madrid).

On the motion of Mr. Lacy W. Ridge, F.R.I.B.A., the following resolution was passed:

> That the Royal Institute of British Architects desires to thank the Local Government Board for the issue of Model By-laws, IV. (Rural Districts). While doing so the Royal Institute would urge on the Board the desirability of preparing a Model to enable Rural District Councils to regulate party-walls as distinct from external walls, a matter for which the Urban Model By-laws, to which the Board refer them, are not available. The Institute grounds this on the belief that the existence of properly constructed party-walls has proved an efficient barrier to the spread of fire, and that it is undesirable that such protection should be withdrawn in places where it has already existed.

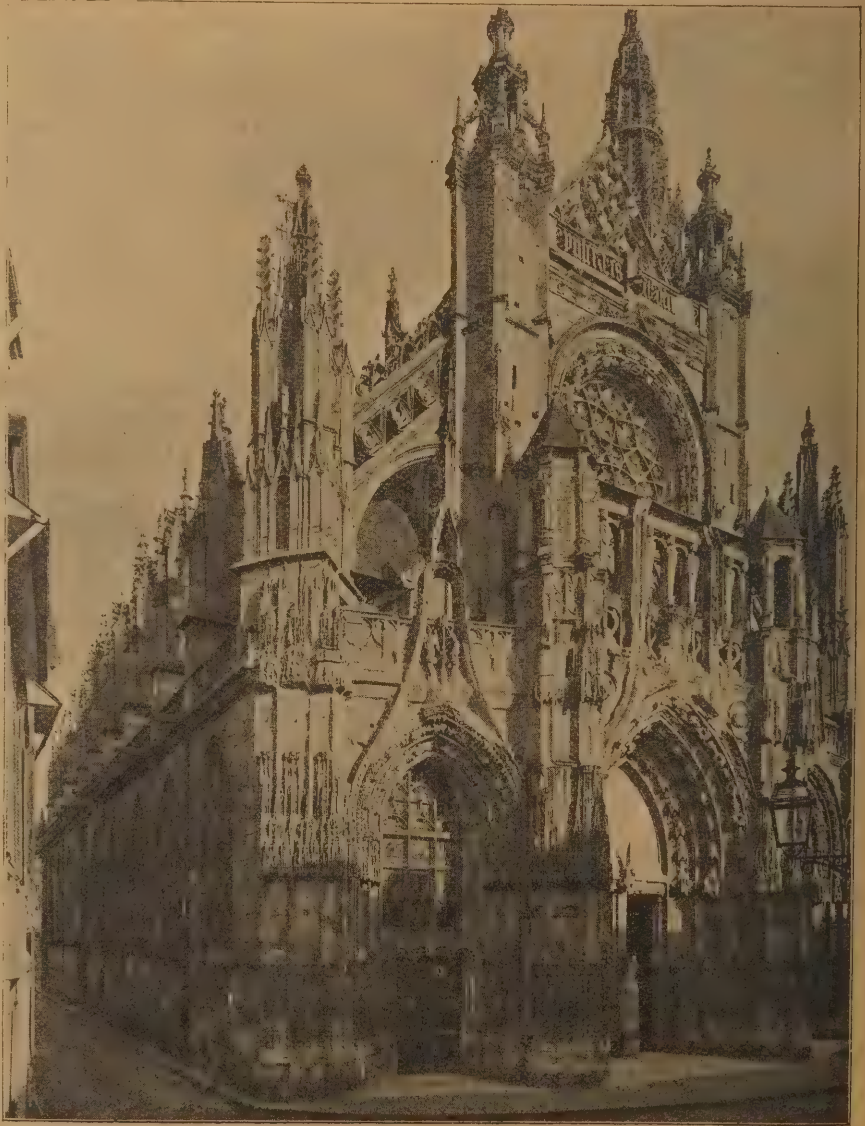
On the motion of Mr. H. D. Searles-Wood, F.R.I.B.A., the following resolution was also passed:

> That this Institute requests the Local Government Board to promote a Bill in Parliament to embody those sections of the London Building Act, 1894, which apply to ownership and the mode of dealing with party-walls, and make them apply to the United Kingdom.

CAUDEBEC.

By H. W. HOBBISS.

THE little town of Caudebec-en-Caux is situated in a beautifully-wooded country on the right bank of the Seine, about half-way between Havre and Rouen. The chief architectural interest is centred in its church, which is of the later Flamboyant period, with a western screen of the irresistible Francis I. date. This western elevation is remarkably beautiful in detail, and harmonises well with the earlier work of the nave and aisles. The accompanying illustration shows a characteristic French plan without transepts. As the south aisle is wider than the north aisle, it follows that either the west elevation has been "cooked" so as to bring the aisle doors equal, or there is a difference of 3ft. in their widths. I am inclined to think the plan is correct, as such a big difference would have been noticed at the time. The vaulting shafts to nave are corbelled out with figures immediately above the pier capitals. There are no capitals to the vaulting shafts. The nave effect is very similar to an English Decorated cathedral, with its beautifully-proportioned triforium and clearstory. One gets a somewhat



THE CHURCH OF CAUDEBEC-EN-CAUX.

discordant line in the triangular termination of nave, but this, however, produces a pleasing chevet arrangement. The church is full of interesting and most delicate carving; much of it was apparently restored during the Francis I. additions. The west end is occupied by the organ, which is corbelled out upon a gallery of Renaissance work. This, and the rose window above it, adds dignity and charm to the interior. Most of the aisle chapels contain piscinæ of the same period, and each is a gem of the mason's craft. There is a great deal of wrought-iron work used for screens, &c., and a dull brass lectern bearing the date 1716 is a work of art. The tower is 330ft. high, of open tracery, surmounted with a triple floral crown; but the effect is far from good architecturally, for it is of too jerky an outline. The town itself contains interesting work. There are many streets that have been unaltered (except by the hand of Time, and that has only beautified them) since the fifteenth century; and in their quaint romantic atmosphere one almost expects to see them suddenly peopled by Warwick's men-at-arms, for the town was taken by him and Talbot in 1419. The surrounding villages of Tumieges, Vatteville, Abbeyville, Norville, Boscherville, all contain work of interest and afford study for the architectural student; they are also within easy reach of Caudebec.

THE COST OF THE CRETAN EXPLORATIONS.

THE balance-sheet submitted by the Directors shows that since the Cretan Exploration Fund was established in the spring of 1900 about £3,500 have been raised by subscriptions, partly from learned societies, but mainly from individuals. Rather more than this sum has been spent on the excavations at Knossos, Kephale, the Dictæan Cave, Kato Zakro and Præsos. Knossos alone is accountable for £2,000, but unfortunately even this does not represent more than half the money spent on this important site. For, without reckoning his travelling or personal expenses, Mr. Evans has himself spent £2,000 on the work in the last two seasons. The large scale of the work, on which throughout the greater part of last season 200 workmen were constantly employed, makes it necessarily costly; and in this case, in addition to many other incidental items of expenditure, a great deal has to be done towards the conservation, and in some cases even the roofing-in, of the chambers discovered. To complete the excavation of the palace it is estimated that another £2,000 will be required, and, considering the unique importance of the discoveries made, it ought not to be difficult, even in these times, to raise so moderate a sum to complete so important a work. Mr. Hogarth has secured the right to excavate another very important early site which he would be prepared to undertake next season if a sum of at least £600 could be raised for the purpose. Unless this sum can be assured this very competent explorer must reluctantly abandon further work in Crete, which would involve a serious loss to archæological research.

Contributions to the Cretan Exploration Fund may be sent to the account of the Fund at Messrs. Robarts, Lubbock & Co., Lombard Street; or to the treasurer, Mr. George A. Macmillan, St. Martin's Street, W.C.

Mr. Shield's Pictures.—Last week, at the Dowdeswell Galleries in New Bond Street, a private view was given of seven paintings by Mr. Frederic Shields, intended to be placed in the Chapel of the Ascension, Hyde Park Place, W., of which Mr. Herbert P. Horne is the architect. Mr. Shield's paintings (which are not treated decoratively) comprise "The First Cleansing of the Temple," "The Lesson of Forgiveness," "The Leper Healed," "Faith," "Patience," "Hope" and "Love." In our opinion they fail in their most important particular—the colouring—and this is most noticeable in the robes of Christ, the fiery-rose tint of which stands out in unpleasant contrast to the rest. It is interesting to note that the pictures are painted on canvas which will be affixed with white lead to slate slabs riveted to the walls of the church, so as to leave an air-chamber behind, after the manner practised by Puvis de Chavannes at Amiens.

A SHORT HISTORY OF SEWAGE PURIFICATION.

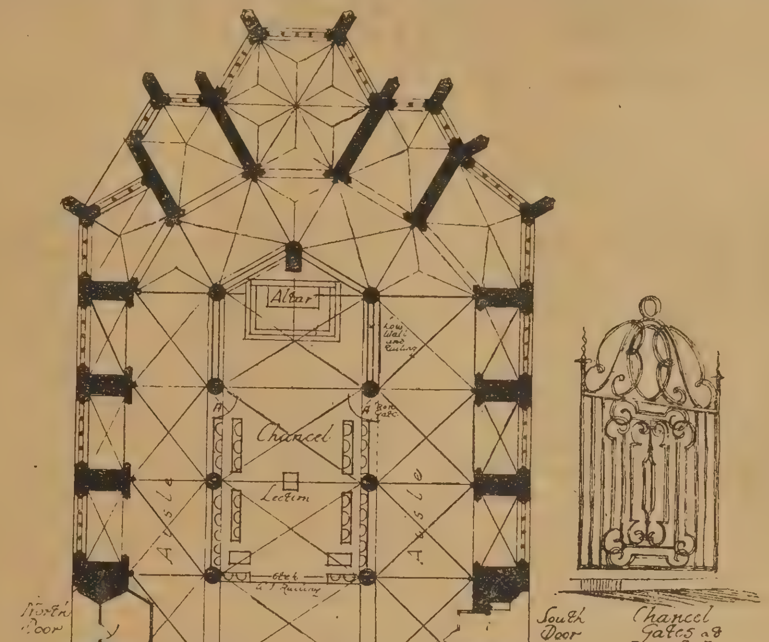
BY H. ALFRED ROECHLING, C.E., F.G.S.

AT a meeting of the Society of Engineers held on December 2nd a paper was read on "The Sewage Question during the last Century" by Mr. H. Alfred Roechling, C.E., F.G.S. After some preliminary remarks relating to his subject, the author gave a short history of the theory and practice of sewage purification during last century. Concerning its theory he remarked that from the position of pure instinct it had advanced through various stages until at last Pasteur and others had given it that form it now generally took—that in sewage purification, mechanical, chemical and biological agencies played an important part, and that the decomposition of the organic matter was in the main a bio-chemical process.

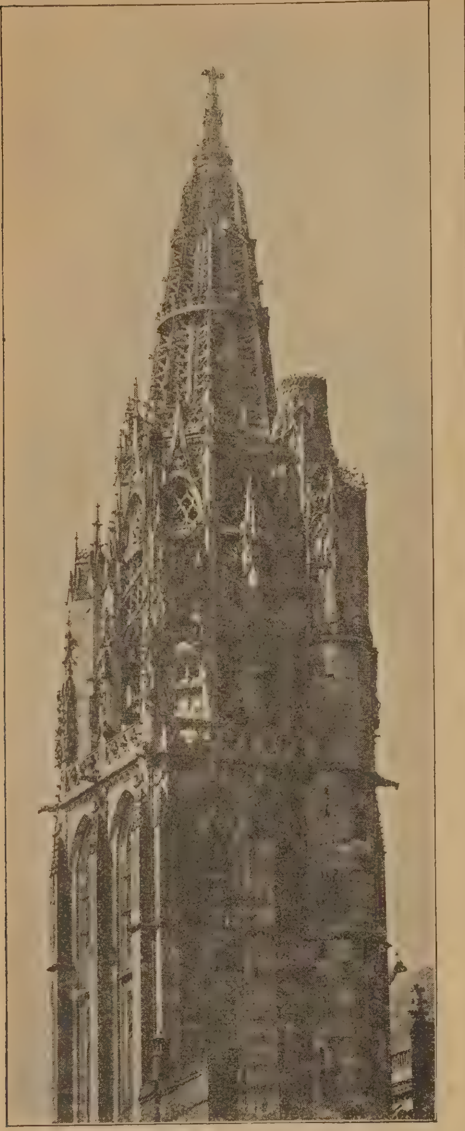
Dealing with the practice of sewage purification, the author observed that the only known method of sewage treatment at the dawn of the last century was irrigation on land. He then pointed out how, years afterwards, chemistry had tried to make a lucrative business out of it; how Commission after Commission, and in fact every authoritative enquiry, had expressed an unmistakable verdict in favour of land treatment, and how, in consequence of this mass of accumulated evidence, the Local Government Board had been compelled to insist on the land treatment of raw sewage or effluent in any scheme of sewage-disposal for which its sanction had been asked.

But the author observed that even the best of land could not do its work for ever if it was not well looked after. And so it happened that, through gross neglect and ignorance, the apparent failures created a strong feeling against land treatment, and finally led to the appointment of a new Royal Commission. This new Commission had just issued its interim report, in which it had re-established land in its position as the first and only natural method of sewage treatment, and had termed all the biological or bacterial methods "artificial," some of which would be admissible without land.

The author next referred to the natural self-purification of sewage, or to the self-purification of sewage in the only natural medium, land, and considered in detail the self-purifying powers of land, mentioning amongst other things that besides its retentive and absorbing properties it possessed also the power to decolorise, to deodorise and to retain and render harmless such poisons as strychnine, nicotine, &c. The self-purifying process, he said, might be likened to a



PLAN OF THE CHURCH OF CAUDEBEC-EN-CAUX. MEASURED BY H. W. HOBBISS AND G. DRYSDALE, AND DRAWN BY A. D. THACKER.



THE SPIRE, CAUDEBEC-EN-CAUX.

process of digestion; and when the digestive powers of land had been over-taxed, sickness was the only natural result.

After describing the work of bacteria in the soil and some products of their activity, the author stated that experience and experiment had proved that the chances of pathogenic germs doing further harm on sewage farms were exceedingly remote. No soil, with the exception of peat—owing to its great amount of moisture—was probably entirely useless, and a loamy sand subsoil had in many instances proved very effective. The depth of soil necessary for purification depended on local conditions, such as the character and thickness of the top soil (humus), the nature of its cultivation, the character of the subsoil (especially its facilities for retaining and exchanging air quickly), the surface slopes of the land, and the level of the subsoil water (thickness of the zone of evaporation, and of the passage and capillary zones).

Dealing next with the artificial self-purification of sewage, or the self-purification of sewage in artificial media, the author remarked that, apart from the sludge difficulty (which had been reduced but not altogether removed), these artificial methods had given very fair and encouraging results concerning the chemical purity of the effluent. But whilst warning his hearers not to expect that these theoretical results would be reached in practical working, and incidentally mentioning two cases of failure of works of this kind, he drew attention to the bacterial impurity of the effluent, which was little better in this respect than raw sewage. The Legislature, however, could not contemplate without the gravest concern the wholesale admission of pathogenic germs into the streams, as an action might lie againt a sanitary authority for causing an outbreak of typhoid fever lower down the stream.

After stating that the excessive quantities of manurial elements in the effluents from artificial self-purification works might engender such a luxuriant vegetation in the streams as to obstruct the natural flow of water and to completely cover the whole bed, the author stated that the objections raised led, in the natural order of things, to the supplementing of the artificial methods by the only natural one—land—when all reasonable requirements would be satisfied. It might likewise prove advantageous to partially treat the sewage by an artificial method before using it on the land. No system, however, would prove successful unless the present method of supervision of sewage-disposal plant was radically altered and the education of future managers systematically taken in hand.

NEW GOVERNMENT BUILDINGS.

MR. AKERS-DOUGLAS'S DEFENCE.

THE Right Hon. A. Akers-Douglas, M.P., First Commissioner of Works and Public Buildings, has taken occasion to publish in the "Times" a defence of his action in regard to the new Government offices in Whitehall and Parliament Street, more especially with respect to the completion of the new offices for the Local Government Board and Education Department designed by the late J. M. Brydon.

The R.I.B.A.'s Letter.

On November 8th last the following letter was sent from the Royal Institute of British Architects to Mr. Akers-Douglas:—

Sir,—The Council of the Royal Institute of British Architects have taken the opportunity of their first meeting of the session to pass a unanimous resolution that representations be respectfully addressed to His Majesty's Government with regard to the present proposal to execute the new Government buildings in Parliament Street from the late J. M. Brydon's designs without the aid of a specially-appointed architect of repute. The Council, with the warm support of the presidents of all the architectural societies in the United Kingdom in alliance with the Royal Institute, whose names are appended as signatories to this letter, venture to express the earnest hope that even at this eleventh hour an architect in sympathy with Mr. Brydon's artistic ideals may be appointed to superintend the erection of this vast building, which, if not very carefully detailed in the spirit in which it was designed, will lose much of the grace with which Mr. Brydon, had he lived, would have clothed it. They would also, with all deference, point out that it is only during the execution of his building that the architect himself arrives at the true development of his original conception, so that, for the successful execution of work of this important character, the inventive genius of a sympathetic colleague of the original designer is essential.

The Council of the Royal Institute of British Architects earnestly and respectfully urge the above considerations upon the attention of His Majesty's Government.

We have the honour to be, Sir, your most obedient servants,

WILLIAM EMERSON (President, Royal Institute of British Architects).
THOMAS DREW, Kt. (President, Royal Hibernian Academy, Member of Council R.I.B.A.).
GEORGE C. ASHLIN (President, Royal Institute of the Architects of Ireland).
F. MARSHALL (President, Sheffield Society of Architects and Surveyors).
S. PERKINS PICK (President, Leicester and Leicestershire Society of Architects).
ALFRED DARBYSHIRE (President, Manchester Society of Architects).
JOHN JAMES BURNET (President, Glasgow Institute of Architects).
FRANK CAWS (President, Northern Architectural Association).
FRANK W. WILLS (President, Bristol Society of Architects.)
ARTHUR MARSHALL (President, Nottingham Architectural Society.
F. M. SIMPSON (President, Liverpool Architectural Society).
W. H. BIDLAKE (President, Birmingham Architectural Association).
BUTLER WILSON (President, Leeds and Yorkshire Architectural Society).
H. G. LUFF (President, Devon and Exeter Architectural Society).
JAMES P. BRUCE (President, Dundee Institute of Architecture, Science and Art).
C. H. CHANNON (President, York Architecture Society).
EDWIN CORBETT (President, Cardiff, South Wales and Monmouthshire Architects' Society).
ARTHUR CLYNE (President, Aberdeen Society of Architects).

Lord Esher's Reply.

In reply to this letter Lord Esher wrote to the Secretary of the Royal Institute of British Architects as follows:—

Sir,—I am directed by the First Commissioner of His Majesty's Works, &c., to acknowledge the receipt of your letter of the 8th inst., together with a resolution signed by the President of the Royal Institute of British Architects and others; and to say that Mr. Akers-Douglas quite appreciates the point of view of those who would prefer some other method of carrying out Mr. Brydon's work than that upon which he has decided. It was, however, after careful examination, during which none of the considerations now urged were overlooked, that the decision to carry out the designs by the agency of Mr. Henry Tanner, F.R.I.B.A., the principal architect of this Department, was arrived at. I may say frankly that among architects of high repute the First Commissioner failed, after some confidential enquiry, to discover any one sufficiently in sympathy with Mr. Brydon's artistic ideals to subordinate his own inventive genius to that of the original designer. It appeared to Mr. Akers-Douglas due to the memory of Mr. Brydon that his work should remain intact, and that the designs which he left should be carried out with as little variation as possible. The question as to whether these drawings are in a sufficiently complete state to enable this to be done is one upon which the First Commissioner is aware opinions differ; but he has confidence in the judgment of his technical advisers, and he will be ready to exhibit these drawings to Parliament should his action, as a Minister of the Crown, be hereafter questioned.—ESHER.

On November 27th Sir John Aird, M.P., wrote a letter to Mr. Akers-Douglas in which he expressed the desire "to be able authoritatively to say that there is no ground for the great uneasiness which would appear to be felt in some quarters in reference to this important subject."

Mr. Akers-Douglas to Sir John Aird.

Mr. Akers-Douglas, in his reply, after detailing the measures originally adopted by the Government for the selection of the architects for the new public offices, said:—

THE LECTERN.
CAUDEBEC CHURCH.

Mr. Brydon left no son or partner to succeed him. It seemed to the Government to be out of the question to abandon his plans after the large sum already expended on them and on the foundation works; and if his designs, which are still satisfactory to the Government, are to be carried out they should be executed in their integrity. I satisfied myself, after careful enquiry, that this object would be best secured by entrusting the execution of the plans to the architects of my own Department. Fortunately, very abundant materials existed for ascertaining Mr. Brydon's intentions. His executors handed over to the Office of Works complete plans, elevations and sections, to the scale of 10ft. to an inch; also full, careful and clearly drawn ½in. scale details of all the important parts. The work of carrying out these designs was placed in the hands of Mr. Henry Tanner, principal architect to the Department, who is a Fellow of the Royal Institute of British Architects, and the winner of their Tite prize for classical design in 1878. Thus qualified, Mr. Tanner may fairly claim to have been recognized by that body as possessing talent for sympathetic treatment of the work. The employment of Mr. Tanner has the great advantage of securing that the building shall be erected with every regard to the requirements of the Departments which will occupy it; and for this end not only Mr. Tanner's own great experience in the erection of very large public buildings, but that of Sir John Taylor (who will be in consultation with him), will be available. Such saving of cost as there may be by this arrangement has only weighed with me as a secondary consideration.

It is obviously unfair to speak of this work, as many do, as if it had been handed over to draughtsmen or architectural clerks, or as if the attention of the Office of Works staff would be given to it in the intervals of ordinary official duties. On the contrary, I have made arrangements in the Department to relieve Mr. Tanner of much of his ordinary business; and Mr. Brydon's chief assistant, who prepared a large proportion of these drawings under Mr. Brydon's direction, has been engaged to assist in working out such details as yet have to be made up. I have confidence in the judgment I have formed upon the advice of my professional staff that this development of the drawings can be faithfully and effectually executed. I shall be prepared to exhibit Mr. Brydon's designs, stamped and signed as being those handed over by his executors, for the information of Parliament, and to defend my action if it should be questioned.

As a further guarantee that Mr. Brydon's work shall be respected, I propose that no variations in the external elevations shall be made without the assent of the advisory committee above mentioned, on which Mr. W. Emerson (president of the Royal Institute of British Architects), Mr. Aston Webb and Sir John Taylor will act; and, in the improbable event of any suggestions for such variations being put forward, I will refer them to this Committee. I venture to think that when my action is fairly considered in the light of the full facts it will be held to have been justified.

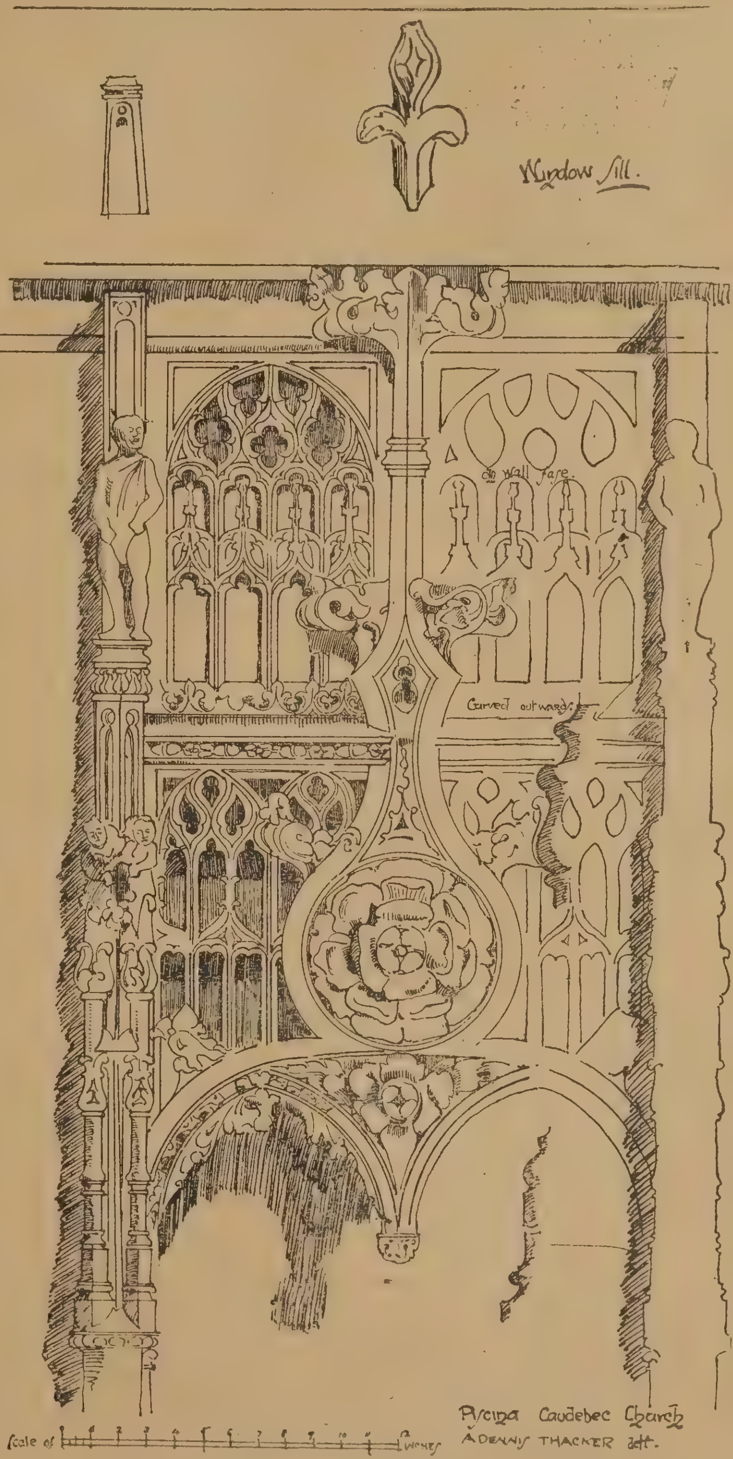
Mr. Leonard Stokes.

With regard to the foregoing correspondence, Mr. Leonard Stokes says:—

We are told "frankly" that the First Commissioner of Works failed, after confidential enquiry, to discover an architect of high repute who would subordinate his own inventive genius to that of the original designer. He therefore thought fit to entrust the work to Mr. Henry Tanner, F.R.I.B.A., chief architect to the Office of Works. Would it be troubling Mr. Akers-Douglas too much to ask for a hint as to the direction in which these "confidential enquiries" were made? I know more than one architect of repute, and I cannot help thinking that at least one of them would have entertained the idea had it been put to him nicely. It would be interesting to know the views of the advisory committee Mr. Akers-Douglas tells us of on the whole question—*i.e.*, if they have been consulted. I happen to have private information on this head, but, of course, I cannot use it here.

May I further trouble Mr. Akers-Douglas with the information that he can never hope to "retain his (Brydon's) work intact," as the drawings which I handed over to him—and for which he paid only two-fifths of the whole fees due—are nothing like complete enough to ensure this? Some other individuality must creep into the building. We had hoped that this might have been the individuality of an outside architect of repute, but fate appears to have decreed otherwise.

It is absurd, under a mistaken sense of loyalty to Brydon's memory, to blindly carry out this great work from details hurriedly made by him, for he would have been the first, as the work proceeded, to thoroughly amend these drawings himself, but the last, I fancy, to ask the Office of Works to do so for him. It is equally absurd to maintain, as Mr. Akers-Douglas suggests, that any gentleman who happens to be a F.R.I.B.A.—their name is legion—and who may have won the "Tite prize" (a small students' affair) in his youth, is therefore to be recognized as suitable to complete the greatest building of the age.



Window Sill.
Wall face.
Carved outwards
Scale of 0 1 2 3 4 5 6 7 8 9 10 11 12 inches

Piscina Caudebec Church
A Dennis Thacker delt.

It is admitted that Mr. Tanner is a very able man, but it is news to some of us that his ability lies in the particular direction now stated. If it does, the wonder is that this has not been discovered sooner, and we shall, I hope, hear more of him in times to come, as there is a great field open before him at the Office of Works.

P.S.—*I have just heard on credible authority that the Office of Works has made a clean sweep of the whole of the sloping roofs as designed by Brydon and substituted flat asphalt ones instead. How does this tally with their recently-published pledges?*

Painswick Parish Church has recently had several additions. The framework of the bell had for some time been in a dilapidated state, and a few months ago steps were taken to rehang the bells in an iron framework. With the old woodwork a lych-gate has been erected at the end of Stroud Road. In addition to these improvements, a screen has been erected at the west end of the church at a cost of £700 by Messrs. Boulton & Son, of Cheltenham, from designs by Messrs. Protheroe & Phillott.

BRICKLAYING AND TRADE-UNIONISM.

A LITTLE RETROSPECT.

MR. SIDNEY WEBB and his wife, Mrs. Beatrice Webb, contend that the absence of any contradiction in the columns of the "Times" is no proof of the correctness of the assertions made in that paper with respect to the decadence among the building trades caused by trade-unionism. "Working men do not read the 'Times,' any more than your correspondent reads our 'Industrial Democracy,' in which he would have found all his charges against trade-unionism examined in full and minute detail, and, we hope, with candour, four years ago. This elaborate work has not been refuted or replied to." They then go on to state in their letter to the "Times" that the complaints as to diminished quantity or energy of work, and of the tacit conspiracy to discourage individual exertion, occur with curiously exact iteration in every decade of the last hundred years at least. "Even in the sixteenth century there were found those who, in the words of Orlando in 'As You Like It,' sighed for—

> The constant service of the antique world"
> When service sweat for duty, not for meed.

But such complaints are evidence only of the psychological condition of their utterers—they prove no objective fact. To give one instance only, we have found exactly the same accusation of the bricklayers limiting the number of bricks, and precisely the same belief that they were only doing 'half as much' as they did twenty years before, in the great strikes of 1833, in those of 1853, again in 1859-60, and again in 1871. We believe them all—that is to say, we take them as some evidence that the employers felt the workmen's constant attempt in all ages to alter the bargain to their own presumed advantage. But we have found absolutely nothing that can be called evidence that the actual *quantum* of work done per hour, quality and conditions being taken into account, is less to-day than it was a hundred years ago. (It must be remembered that brickwork differs enormously, and that some that passed muster in old days would not now be allowed by the architect or district surveyor.) We must add that we entirely disbelieve in the existence of any unwritten limit of 400, or any other number, of bricks per day as a consciously agreed-upon limit. This is another old story, for which, after much investigation, we have never been able to find any evidence."

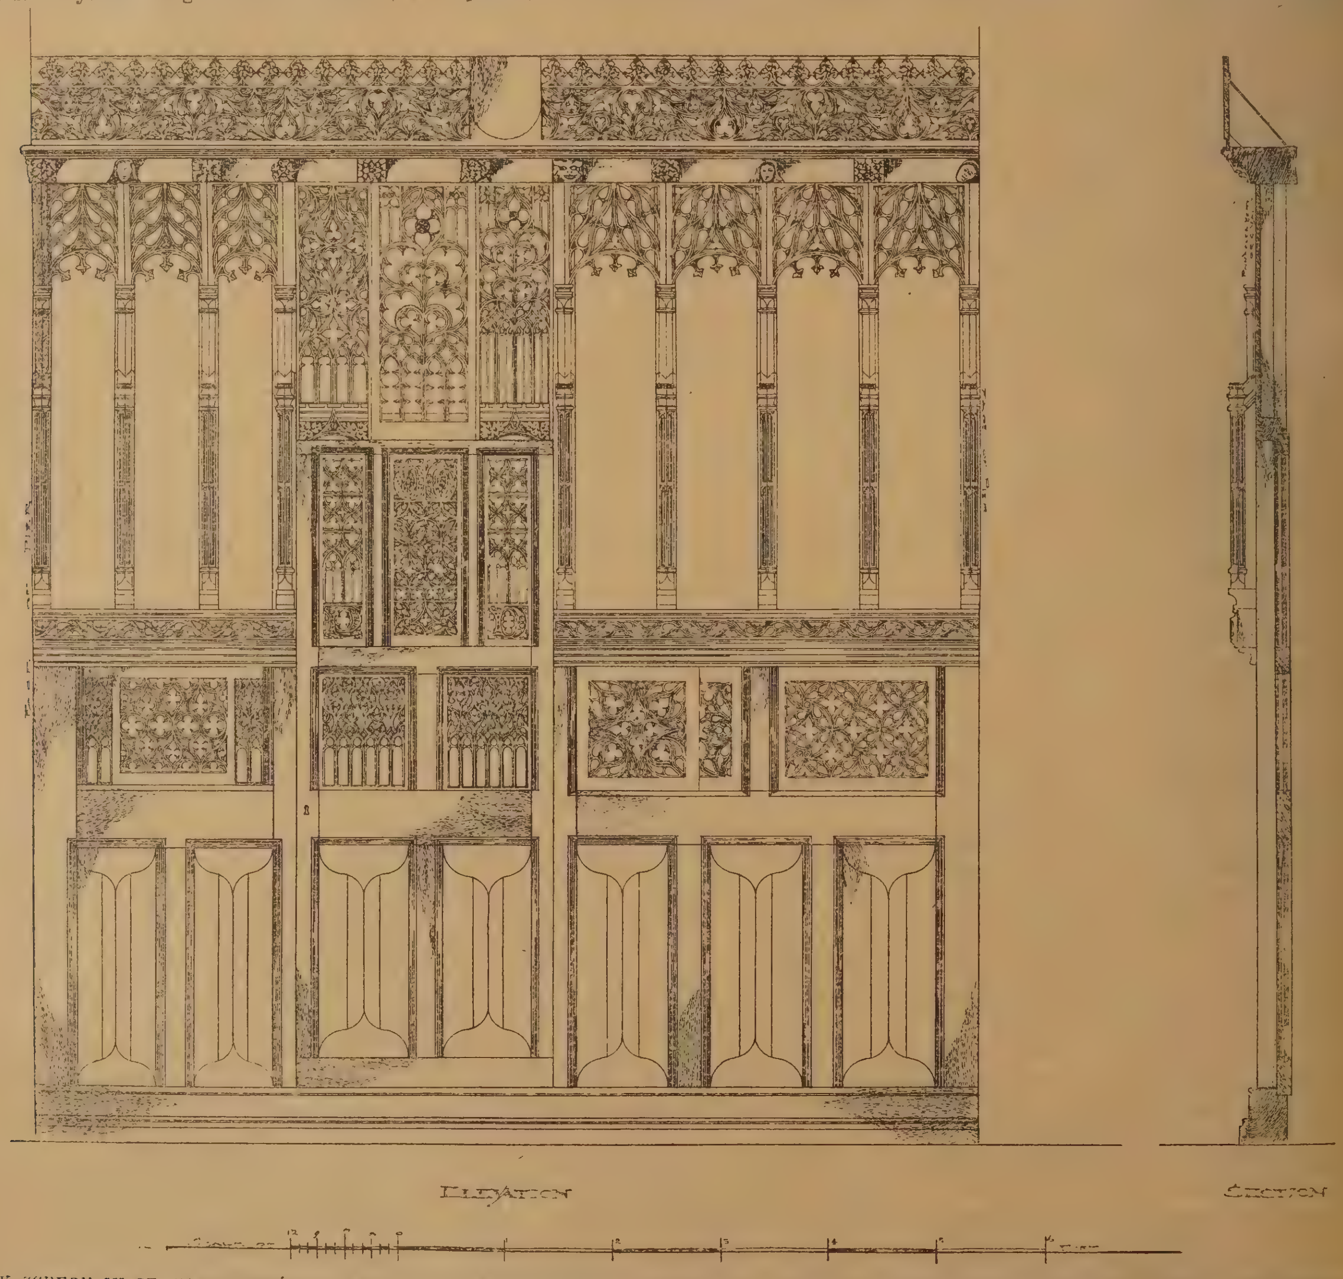
Mr. Webb and his wife occupy the rest of their letter with a lengthy discussion of the merits and demerits of trade-unionism, which we have not the space to print. They state that, though they hold no brief for trade-unionism, they believe, after considerable investigation, that the statements made in the "Times" are "quite incorrect and the reverse of the truth."

Earl Grey's Views.

Speaking at Bolsover on Saturday last, Earl Grey referred to the effect of trade-unionism on British industry, and said that what was wanted was education, conferences between the representatives of employer and employed, and a full knowledge of the cost of production both in this and other countries. The standard of wage which aimed at not a minimum but a maximum, beyond which a workmen should not be allowed to go, killed excellence and produced dishonesty. The building trade furnished the greatest illustration of the evils which result from restriction of output. In this business there was no international competition. The builders of New York could not compete with the builders of Bolsover, and the builders of Bolsover could not compete with the builders of London. The restriction of output increased the cost of building, raised the rents, caused overcrowding, produced debility, which in its turn drove people to drink. What was wanted was the application of co-partnership principles and the imitation of the example set by Mr. Bainbridge, who had endeavoured to secure for his workmen the advantages of the towns and the fresh air of the country.

A Bricklayer Explains Why Fewer Bricks are Laid.

Mr. J. D. Maitland says in a letter to the "Times":—An average brick and its bed weigh 7lb., 1,000 equal 3½ tons, and it is impossible to properly lay this number in an ordinary day. The reason why fewer bricks are laid per day are: (*a*) A nine-hours' day, as against the 10½ of old. (*b*) The disappearance of the jerry-built front, with its sham masonry, stucco veneer and backing of



OAK SCREEN IN ST. CATHERINE'S CHAPEL, CARLISLE CATHEDRAL (DATE ABOUT 1480). MEASURED AND DRAWN BY DANIEL B. PATTERSON.

shoddy bricks. This is now replaced by sound honest work, well and truly laid. Some class of facings, notably stocks, on good work frequently cost twice as much to select as to lay, owing to the inferior nature of the bulk sent in by the contractor. (*c*) The generation which did such marvellous things were, for the major part, coarse, ignorant, beer-loving men, exploited by their shrewder compatriots, rightly called taskmasters, who, taking work by the piece, succeeded by the aid of a little beer and a copious supply of adjectives in inducing the workmen to slave like the fools they were.

New Patents.

These patents are open to opposition until January 13th, 1902.

1900.—Fastening Door-Knobs.—20,495. H. C. PRUCE, of the firm of A. Brown & Co., Smallbrook Street, Birmingham. Holes are drilled through the spindle at intervals, and the neck of the door-knob has a hole in it which is straight to the middle clearance and then diverges at each side. Thus, when a split pin is driven in, it spreads and so secures the knob to its spindle.

Conveyors.—21,238. W. H. ASTON, 46, Eagle Wharf Road, London, N. This conveyor is intended for transferring goods from one level to another—for example, from a railway truck to a shed. It consists of a girder frame carrying a drum at each end, over which passes an endless band. This frame is pivoted at one end to a suitable carriage having a motor (preferably electric) for driving the band attached to it. By these means goods are transferred continuously from one end of the frame to the other, thus facilitating discharge.

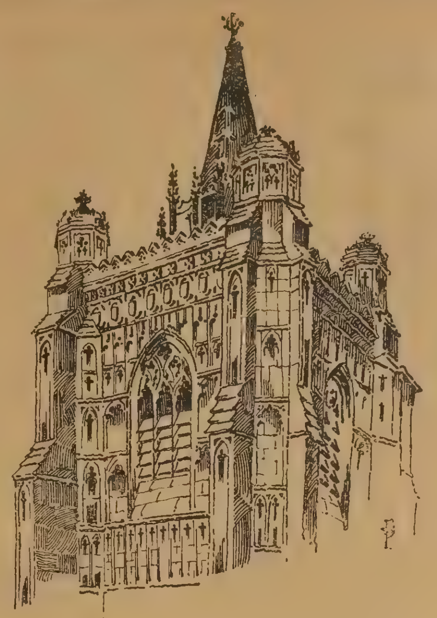
1901.—Preventing Steamy Windows.—1,526. B. WOLFENDEN, 809, Attercliffe Road, Sheffield. At the bottom of the window, in the centre, a gas burner is fixed. Over this fits a perforated metal chamber or hood having arms stretching across the window and perforated on the glass side. The hot air which is thus distributed over the window surface prevents steam condensing on the glass.

The following specifications were published on Saturday last, and are open to opposition until January 20th, 1902. *The names in italics are those of the communicators of the inventions. A summary of the more important of them will be given next week.*

1900.—20,239, KEITH, apparatus for heating and ventilating. 20,320, PFEIL, tenon joint. 20,667, BRAILSFORD, straightening and tempering saws. 20,917, HOGGART & ARNOTT, sliding catches, bolts or detents. 22,645, HUMFREY, gas stoves. 22,838, JENKINS, folding trestles. 23,362, HARVEY, hinges. 23,446, HOLDEN, iron-pipe wall-fastenings.

1901.—379, PARKES, locks. 511, SCHICKE, door-locks. 906, SEFTON-JONES (*Fader*), automatic gas-lighting apparatus. 2,482, COOKE, overflow and waste-water pipes and valves for lavatory basins. 3,917, WILLS, water-closets. 4,257, OGDEN, securing rainwater pipes. 18,368, HOYER, locks and fastenings for doors. 18,419, RÜCKGAUER, device for lifting and removing heavy weights, buildings, &c. 18,480, GUMPEL, circular saws. 18,580, DÜR, adjustable supports for scaffolding, staging, &c. 19,994, GIBSON (*W. S. Tyler Co.*), elevator gates. 20,297, LESLIE, door-knobs and spindles. 20,380, MONSHAUSEN, roofs of metal plates or tiles. 20,746, PLATT, traps for drains.

The Oak Screen to St. Catherine's Chapel, Carlisle Cathedral (of which a measured drawing by Mr. Daniel B. Patterson is given on the opposite page), is situated in the western transept, and probably dates from about the middle of the fifteenth century. Portions of it have been destroyed, such as the pinnacles which once surmounted the buttresses; also, some of the panels have been partly replaced by others of a different design.



TOWER OF ST. PETER MANCROFT, NORWICH.
G. E. STREET, ARCHITECT.

Bricks and Mortar.

APHORISM FOR THE WEEK.

Construction should be the origin of decoration and ornament; but in its turn should be subservient to them, as in the flying-buttresses of our Gothic edifices.—PROFESSOR DONALDSON.

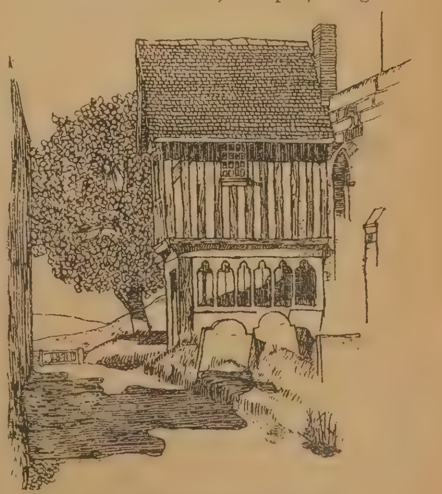
Our Plates. THE police entrance to the Central Police Station at Hull will be erected on the site of the present police station. Plans and a description of the new building were given in our issue for September 11th last.—The mission room attached to and adjoining Camden Church (famed for its chancel designed conjointly by the late Sir George Gilbert Scott and Mr. Ruskin) is one of many such buildings either completed or to be erected in South London under a scheme instituted by the Bishop of Rochester, who has personally interested himself in the work, and opened it in the spring of last year. The vicar, the Rev. Philip S. O'Brien, D.D., and Committee, placed the work in the hands of Mr. A. H. Ryan-Tenison, A.R.I.B.A., of 12, Little College Street, Westminster, who has executed considerable work in the parish. The design comprises a large hall and choir assembly-room, classrooms, retiring rooms and a caretaker's house. The hall alone is erected, but it is hoped at no far distant date to complete the whole scheme. It might be pointed out that the architect has met with considerable difficulty with reference to the levels on account of the instructions that the building must be placed within a few feet of the church and yet not impede the lighting to this latter, and that he has coped most successfully with both points. The contractor was Mr. H. H. Hollingsworth, of High Street, Peckham; and the furnishing was carried out from special designs of the architect by the Educational Supply Association, Limited. The cost to the present has been a little under £2,000.

St. Peter Mancroft. THE church of St. Peter Mancroft was restored in 1881 by the late Mr. G. E. Street at a cost of £14,000, the tower being completely restored at a cost of several thousand pounds and surmounted by a leaden flèche 40ft. in height, making a total height from the ground of 150ft. This tower is said to contain the finest peal of twelve bells in the kingdom. The church is cruciform in plan and of fifteenth-century date. The church was built in the Magna Crofta, or "great field" belonging to the castle, and became known as St. Peter in the Magna Crofta, and in course of time, by contraction of names, as St. Peter Mancroft. It is a fine specimen of Perpendicular architecture. The drawing is by Mr. Frederick G. Pain.

To Improve Manchester. MR. EDWARD SALOMONS has a scheme for improving Manchester. Instead of purchasing the Infirmary as a site for the new Art Gallery and home for the Reference Library, he would place these buildings in a square to be created by the acquisition of the whole of the land in Oxford Street, bounded by the M. S.J. and A. Railway, Great Marlborough Street, Sackville Street and Pritchard Street. This would give an open space of 58,000yds., or about twelve acres. Of this, 27,700yds. would have to be purchased, the streets accounting for the rest of the area. The extreme value of this land he puts at from £6 to £7 a yard, at which figure the cost would be about £194,000, as against a minimum, say, of £500,000 for the Infirmary. There would be ample space for an Art Gallery and Library, and a new open space formed only half a mile from the Town Hall. This district, he thinks, would in a few years become the fashionable centre of Manchester. A municipal theatre might also with advantage be erected on the site, and run with profit to the ratepayers. Mr. Salomons further suggests that if such an open space were made Oxford Street should be widened to, say, 120ft. right up to Whitworth Park, and this, he says, would at once decide what would be in the future the fashionable and literary, educational and art centre of Manchester.

Berkswell Church Porch. THIS church is dedicated to St. John the Baptist, and is a very interesting building. The chancel is a very good specimen of Norman architecture, one of the principal points of interest being the Norman crypt, which lies under the chancel and east end of the nave, the portion under the latter being octagonal and supposed to be of Saxon origin. The half-timber porch is not very often found in old churches. This one is of seventeenth-century date, and has a room over it which is used as a committee-room; it is reached by an outside staircase, and the woodwork has good details and carvings. The nave of the church has three different levels, and the aisles on the west and south have some finely carved and cut oak screens, one or two of the arches being Norman. The nave also has some Early English and Decorated portions. The clearstory and tower are seventeenth-century work. The drawing on this page is by Mr. E. Stanley Mitton.

Bewcastle Church Restored. BEWCASTLE CHURCH was practically rebuilt in 1792 and irredeemably spoilt. Six yards and a half were cut off the west end of the nave, and a curiously ugly tower erected. Inside galleries were inserted across the west end, and right up the north side to the chancel. To make room for this the walls had to be raised some 4ft., altering the old high-pitched roof into an ugly 45-deg. pitch. The old Early English windows thereupon appeared too short, so to make matters worse their shapely lancet heads were cut off and lintelled over square, and the upper part of the south wall was pierced with a second tier of square-sashed windows. Fortunately the east end and ancient buttresses (which are said to bear date 1066) escaped, though the



PORCH, BERKSWELL CHURCH.

two side-lights of the east window were walled up, so there are still to be seen the credence table in the north wall and the piscina in the south wall, and the two windows mentioned were reopened out some time ago. Since this "restoration" in 1792 no material alterations have taken place until now. The timbers had all become rotten, and the plaster peeled off, while the heavy roof was in danger of falling in, so that the present work of restoration became needful. Assistance has been given in the matter by Mr. W. G. Collingwood (the late Mr. Ruskin's secretary), and through his interest Mr. J. F. Curwen, architect, of Kendal, undertook the restoration. The result of the effort to give back to the church the character it possessed before 1792 has been successful. The piece cut off the nave could not be replaced, but the windows have had their lancet heads restored to them, the gallery running west to east has been removed and the walls lowered, the roof has again its original pitch, and the whole building has been re-lined and re-seated at a cost of about £620.

The Late Mr. C. J. Innocent.

WE regret to announce the death of Mr. Charles John Innocent, architect, of Sheffield, which occurred last Saturday week, at his residence, Wellesley Road, Sheffield, at the age of sixty-two years. Mr. Innocent was a Sheffield man, his father being Mr. John Innocent, a publisher well known in his day. His school-days over at the Sheffield Commercial Academy, he was articled to the firm of Weightman, Hadfield & Goldie, architects. In the year 1862 he commenced practice on his own account. The adoption of the Education Act of 1870, and the immediate demand for school buildings of an up to-date kind, proved a good thing for more than one architect. Mr. Innocent was fortunate enough to be appointed architect to the Sheffield School Board in 1871. School after school went up in quick succession from plans of his preparing, and about twenty of the older schools were designed by him. He also invented various school appliances, and included in his published writings is one on "Public Elementary Schools." Mr. Innocent was elected a Fellow of the Royal Institute of British Architects in 1889, and had served on the Council. He was also a Fellow of the Provincial Committee of the Surveyors' Institute. He acted as honorary secretary of the Sheffield Society of Architects and Surveyors for some years, and had also been president. In his professional capacity he had a considerable amount of work for the Sheffield Board of Guardians, providing the plans for and superintending the erection of the headquarters of the Children's Homes and the Cottage Homes for selected aged people. He acted as architect for Montgomery Hall, Glossop Road Baptist Church, St. John's Chapel, Crookesmoor, and many other well-known buildings in Sheffield and district. He recently took his elder son, Mr. C. F. Innocent, into partnership.

Street-Decoration.

NEXT June at the Coronation the City of Westminster will have an opportunity of distinguishing itself in the matter of street adornment, and already there is talk of starting the preparations. The General Purposes Committee of the Westminster City Council, it is stated, will take some part in deciding on the method of decoration, and it will doubtless have many plans submitted. Among them will be one suggested by Mr. F. Vigers, which provides an harmonious scheme of decoration for the whole of the route to be followed by the Coronation procession. He proposes that the roadways between Buckingham Palace and Westminster Abbey should be lined with Venetian masts, of original design, decorated with garlands of leaves and flowers, and also with celluloid spheres for illumination at night. In the immediate vicinity of the Abbey the masts would be replaced by white columns decorated with the royal arms, the garter and the crown, and surmounted with winged figures capable of being illuminated from below. At intervals along the route there would be triumphal arches of varied design. The first would represent Great Britain and Ireland, the second the Indian Empire, the third Canada, the fourth British Africa, and the fifth Australasia. Perhaps the most effective of all would be the Indian arch. This would consist of two white towers surmounted with gilded and coloured domes which could be electrically illuminated after dark. Between the towers would hang a large canopy of yellow silk topped with the Imperial crown. There is also a design for a royal canopy for use outside the Abbey. The scheme of decoration adopted should be both harmonious and in good taste. The local authorities charged with the consideration of the matter will, therefore, no doubt meet the public wishes if, without in the first instance committing themselves to any particular design, they adopt the principle laid down in the following passage from a letter from Mr. H. H. Armstead, R.A., to Mr. Vigers: "It would be much better to have the decorations designed and produced by an artist like yourself, who would make a labour of love of the work, than by an ordinary firm of contractors."

Princes Street, Edinburgh.—The photograph on this page (by Mr. F. J. Pape) shows on the left the new railway hotel at Waverley Station, a most unhappy building. It hides the view of Carlton Hill from many points and spoils it from all; it is of a white stone which does not harmonize with the blue-grey local stone of the rest of the city, appearing glaring in comparison.

PRINCES STREET, EDINBURGH.

Builders' Notes.

The Scarborough Master-Builders' Association held its annual meeting recently, Mr. A. W. Sinclair (president) occupying the chair. The annual report and balance-sheet, presented by Mr. R. H. Carr, were considered very satisfactory and were adopted. The officers for the ensuing year were re-elected as follows:—President, Mr. A. W. Sinclair; vice-president, Mr. T. B. Jowsey; auditors, Mr. W. Malton and Mr. W. Tindall; secretary, Mr. R. H. Carr.

The Master House Carpenters' and Joiners' Association held its annual meeting at Aberdeen recently, Mr. J. A Smith, president, in the chair. The death of Mr. Samuel Milne (of Messrs. M'Robbie & Milne, builders) was referred to. The following are the office-bearers of the Association for the ensuing year:—President, Mr. J. A. Smith (D. Macandrew & Co.); vice-president, Mr. Alexander Hall, Mile End; secretary, Mr. Henry Peterkin; treasurer, Mr. James Robertson, Princes Street; convener of Contracts Committee, Mr. William Dawson, Huntly Street; convener of Trades Committee, Mr. James Leslie (Leslie & Hay).

London County Council.—At last week's meeting of the Council the report of the Highways Committee, dealing with the tramway accounts for the year ending March 31st last, came up for consideration. It showed that from the southern system worked by the Council there had been a profit of £14,325 14s. 10d., and from the northern system (leased to the North Metropolitan Tramways Co.) a profit of £40,151 17s. It was recommended that a further £29,000 be transferred to the Special County Account, making £89,000 transferred in relief of rates for the year under review. After discussion this was agreed to.

The National Association of Slate Merchants and Slaters held its ninth annual conference at Scarborough recently. The president, Mr. Jonathan Davies (Portmadoc), in his address, said the Association had in several directions taken a practical step forward. The quarries were favourable to the Association, and an arrangement between the Welsh quarries and the Association was not only feasible but probable at no distant date. He considered that if roof-slating was to hold its own in the future it must be well done and be more artistic than in the past. Mr. Davies was re-elected president and the other officers were elected:—Vice-presidents, Messrs. William Follit (London), J. B. Johnson (Liverpool), R. Mascall (Middlesbrough), D. Nelson (Sunderland), J. E. Nelson (Sunderland), R. B. Starkey (Leicester); hon. solicitor, Mr. F. W Spink (Hull); hon. treasurer, Mr. Joseph Hunter (Hull); hon. general secretary, Mr. James Townsley (Hull).

Fire Tests with Doors.—A series of investigations were conducted by the British Fire-Prevention Committee on Wednesday last at their Bayswater testing station. Mr. Edwin O. Sachs, chairman of the Executive, presided; and among the principal visitors were Sir Joseph Renals, Bart. (late Lord Mayor), Sir James Szlumper (late Mayor of Richmond), Major Fox (London Salvage Corps), Captain Dyson (Windsor), and a number of representatives from the London County Council, the local authorities and principal fire-insurance companies. The afternoon was devoted to tests, first, with two double deal doors and two double oak doors; and then with a single "Jarrah" wood door and a single "Karri" wood door, the thickness of the doors in each case being 2in. The double oak doors appeared to have very considerable fire-resistance compared to the deal double doors, the test in each case extending to $1\frac{3}{4}$ hours. The "Karri" and "Jarrah" wood doors were unfortunately badly constructed by the makers, and, although the wood itself showed considerable resistance during a test of one hour, the fire appeared to get through where the joints had not been satisfactorily made. The full official reports will shortly appear in the usual way. It might be noted that the testing operations were somewhat hampered by the fog, all the photographs and records having to be taken by flashlight. Prior to the tests, Mr. Sachs entertained a party of officials and visitors at luncheon in the principal committee-room.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Party Wall Notices under the L.B.A.

E. H. D. writes: "A. and B. are adjoining and building owners respectively. A. has instructed me to act for him, B. having commenced pulling down and clearing his site for rebuilding. There are two walls built against each other, instead of a party wall dividing the premises. Both buildings are of old construction. I request B.'s surveyor to serve notice on A. in accordance with the Act. He declines to serve notice. My contention is that B. has no right to commence to pull down the external wall or take away support by clearing his site or shore up A.'s wall without having previously served notice on A. under Part VIII. of the Act. B.'s surveyor contends that there is no section under Part VIII. of the Act which compels him to serve notice on A. until he has cleared the site and determined what is required to be done; and if he does not require to excavate deeper than the foundation of A.'s wall, he is not bound to serve notice at all. My interpretation of the Act is that every building owner is bound to give notice to an adjoining owner before he commences to pull down, whether the wall is a party structure or external wall built against the adjoining owner's wall, and that it is an offence against the Act not to do so. Is this interpretation correct?"

B.'s surveyor is in the right.

Fumigating Oak, Preventing Condensation, &c.

Northampton.—Youngster writes: "(1) I wish to fumigate a large hall fitted up in Austrian and Canadian oak. How should it be done? In what vessel should ammonia be put, as I find it comes through glass and earthenware dishes? Why do the fumes darken the oak? (2) How is it possible to prevent condensation on a glass shop-front? (3) Would aluminium letters on a teak fascia board require much cleaning, as they will be 12ft. above the ground. (4) Where one's client decides to buy fittings direct, who is entitled to the builder's discount."

(1) The process of fumigating oak is described in detail on page 392 of our issue of December 19th last. Beeswaxing protects the oak, but imparts a disagreeable finish; oil is perhaps better, though the whole process of imitating antique oak is wrong in principle and much to be deprecated. The fumigation should not be performed in the hall itself, but the furniture removed to a small receptacle or room, otherwise everything will smell of ammonia for some time. Ammonia does not penetrate glass or glazed earthenware dishes. The cause of it turning the oak a dark colour is probably due to the tannin in the oak being resolved into gallic acid, which, absorbing oxygen from the air, turns black. (2) The usual method of preventing condensation is to put a high screen behind the window, with ventilation at the top near the ceiling, and to place close to the glass several Bunsen gas burners, which will keep moisture in suspension in the upward current of air they will produce. Condensation might be prevented by forcing up a current of warm dry air near the glass. In Russia we have noticed that boxes of salt are placed in the windows of houses to absorb the moisture, and they act admirably, though with the atmosphere heavily laden with moisture, as in a shop, the salt would need frequent replacing and be somewhat of a nuisance. Too much ventilation in the window would let cold air in there, and condense the moisture just where it is not wanted. The cold air should be brought in on the other side of the window back or screen. (3) The aluminium will not need much cleaning, though it will not remain polished without constant attention. (4) We think the client is entitled to the discount, but this should be clearly stated in the quantities. It is only fair, however, that the builder should be allowed to buy everything, so that he may have the advantage of gaining any extra discounts he may be able to obtain from his constant dealings with the manufacturers or merchants.

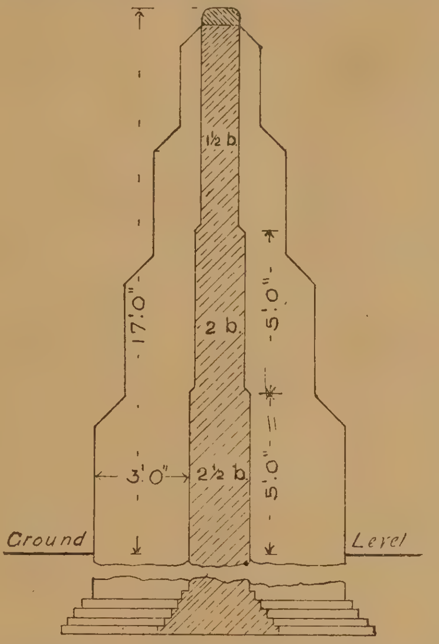
Skittle Alleys.

Bristol.—Luap writes: "I have to reconstruct a skittle alley. Kindly state the correct length and breadth, and other particulars."

See p. 45 of our issue for February 21st, 1900, and p. 344 of our issue for June 13th, 1900.

Stability of High Wall.

Whitley Bay.—A. H. writes: "I have to design a brick wall 17ft. high and 400ft. long. It has not to sustain any load, being merely a screen, and only the wind-pressure need be taken into account. According to calculation, allowing only the resultant weight of the wall about its middle-third to balance the wind-pressure, the thickness required seems to be ridiculously large. What it your opinion of the following section (not reproduced)? Do you think it excessively heavy? The wall would be built in 3 to 1 cement mortar. I have been unable to find anything written on this subject."



So far from querist's sketch showing too thick a wall, it is not substantial enough, and the writer would suggest that it be built in English bond of the accompanying section, with buttresses 12ft. centre to centre on alternate sides. If the wind is much stronger from one side than the other, the buttresses may be all on the side opposite to that on which the wind blows. The wall is estimated to be just safe with a wind-force of 22lbs. per sq. ft. on the upper section and 18lbs. per sq. ft. on each of the lower sections. This, of course, is much less than the reported values of wind-pressure in exposed places, and may not be sufficient for the case in point, but would be enough for ordinary town work. Without knowing all the circumstances one can hardly give a definite opinion, as another half-brick in thickness for the whole height might be necessary or an increase in the number of the buttresses. HENRY ADAMS.

Strength of Cast-iron Gutter as a Girder.

W. C. B. writes: "Kindly give a formula for calculating what weight the gutter shown on the accompanying sketch will carry at different spans."

This example (Fig. 1) partakes of the nature of a cast-iron girder with bottom flange, two webs and no top flange, and owing to its irregularity no exact calculation can be made. It may, however, be assumed as equivalent to a cast-iron inverted tee, as Fig. 2, having a flange of 15in. by 1½ sq. in. and web of 9in. by 1½in. The centre of gravity, and therefore neutral axis, of the assumed section, measuring from top edge, will be

$$y = \frac{d}{2} + \frac{\frac{1}{2}\text{BDT}}{\text{BT} + dt}$$
$$= \frac{9}{2} + \frac{\frac{1}{2} \times 15 \times 10\frac{1}{2} \times 1\frac{1}{2}}{15 \times 1\frac{1}{2} + 9 \times 1\frac{1}{2}}$$
$$= 4{\cdot}5 + \frac{118{\cdot}125}{36} = \text{say } 7{\cdot}8.$$
$$x = \text{D} - y = 10{\cdot}5 - 7{\cdot}8 = 2{\cdot}7$$
$$z = x - \text{T} = 2{\cdot}7 - 1{\cdot}5 = 1{\cdot}2.$$

The amount of inertia will be

$$\text{I} = \frac{\text{B}(x^3 - z^3) + t(y^3 + z^3)}{3}$$
$$= \frac{15(2{\cdot}7^3 - 1{\cdot}2^3) + 1{\cdot}5(7{\cdot}8^3 + 1{\cdot}2^3)}{3}$$
$$= \frac{269{\cdot}325 + 714{\cdot}42}{3}$$
$$= 327{\cdot}915, \text{ say } 323.$$

Working strength in tension = 1½ tons per sq. in., compression 7 tons per sq. in. Now, in all such cases Effort = Resistance, *i.e.*, Bending Moment (M) = Moment of Resistance (R), but the bending moment is $\frac{\text{W}l}{k}$, where W = load, l = span, k = coefficient of reaction = 8 for distributed load; and the moment of resistance $= \frac{\text{I}}{y}\text{C}$, where I = moment of inertia, y = distance from neutral axis to furthest edge of section, C = stress allowed = 7 tons per sq. in. in compression.

$$\therefore \frac{\text{W}l}{k} = \frac{\text{I}}{y}\text{C},$$
$$\text{whence W} = \frac{\text{I}}{y} \times \text{C} \times \frac{k}{l}$$
$$= \frac{328}{7{\cdot}8} \times 7 \times \frac{8}{l}$$
$$\text{W}l = 2355 \text{ inch tons.}$$

For l in ft.

$$\text{W}l = \frac{2355}{12} = 196,$$

or the safe distributed load for a span of 1ft. = 196 tons, and for any other span

$$\frac{196}{\text{span ft.}} = \text{tons distributed.}$$

HENRY ADAMS.

Liability for Kerbing Old Road.

Bradford.—X. Y. Z. writes: "A certain road has existed in a large provincial city for more than a hundred years. Forty years ago it was partly widened by the corporation and its name altered. Are the city council responsible for the kerbing, sewering, &c., if the road is developed as a building estate? The vendors would be prepared to give the land necessary for the widening in conformity with the building by-laws."

Querist does not give sufficient details of the exact circumstances to enable us to form a definite opinion on the matter. Has the road-

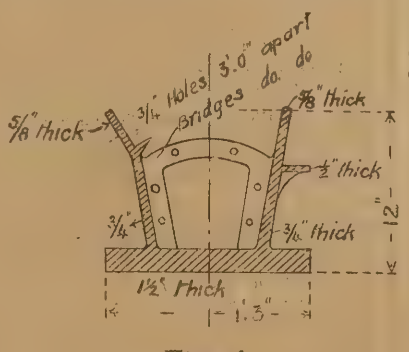


Fig 1

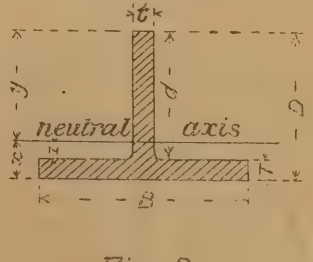

Fig 2

STRENGTH OF CAST-IRON GUTTER AS A GIRDER.

way in question ever been formally "dedicated" by the authority, and is it a "highway repairable by the inhabitants at large"? The probability is that formal dedication has not taken place, and that the latter clause of section 150 of the Public Health Act, 1875, applies. This states in regard to the making-up of "private streets" that "the same proceedings may be taken and the same powers may be exercised in repect of any street or road of which a part is or may be a public footpath or repairable by the inhabitants at large." The Act therefore enables the authority to call upon the abutting owners or frontagers to make up the whole of a street, if part of it is not repairable by the inhabitants at large, although the remainder may consist of an ancient footpath or may be otherwise repairable by the inhabitants at large. In the case of *Evans* v. *Newport Urban Sanitary Authority* an old road, repairable by the inhabitants at large, was widened by the adjoining landowner, and houses were built along it. The authority made up the road so widened under the section above quoted, and were held entitled to recover the expenses by virtue of the last clause of the section. Querist's case appears to be a parallel one to this, and, in the absence of further details, our opinion is that the authority are entitled to call on the abutting frontagers to bear the cost of making up the street in question. W. H. M.

Marbles for Floors.

LEEDS.—J. C. writes: "Which is the most durable kind of marble to use for a floor outside? It is to be in 9in. squares, black and white."

See an article on Marbles on pp. 230 and 239 of our issues for November 15th and 22nd, 1899.

Cellar under Roadway.

HASTINGS.—NIMANEB writes: "A. lives in a house fronting a main thoroughfare, and part of his cellarage extends under the public pavement. The road is to be widened, and will then come partly over the vault, which has apparently 9in. walls and arch only. What strengthening would be necessary to take the increased weight of traffic? Are there any recognised data for calculating probable weights and strains, &c.?"

When the traffic is entirely unrestricted, and road rollers, traction engines, boiler trollies, &c., may pass over the roadway, an allowance of 5 cwt. per sq. ft. must be made beyond the dead weight of material; but over a small bridge, cellar arch, or similar structure, allowance must be made for 8 tons concentrated on one wheel over centre of span, assuming it to be spread over a width of the arch equal to the depth below the surface to centre of thickness of arch. Querist does not say whether there are adjoining cellars, nor does he give the rise of the cellar arch. These are two possible methods of strengthening:—(1) To build two more 4½in. rings in cement inside the present arch, with the skewbacks on half-brick lining-walls in cement. If the centre upon which the arch is turned were limited in width to 18in. or 2ft. the extrados of the new rings could be packed close to the soffit of the old. (2) To uncover the cellar to the extent of the proposed widening, remove the arch, build 9in. brick wall in cement at each side within present walls, lay three 10 by 6 by 45lb. rolled steel joists over the space, about 2ft. 3in. centre to centre, on 3in. York stone templates 18 by 9, or 14 by 12; put temporary stage underneath, and lay cement-concrete within the full depth of the joists, resting on the back wall of the cellar and on a 6in. by 3in. by ½in. angle on the front edge. HENRY ADAMS.

The Annual Dinner of the York Architectural Society was held on Thursday last, Mr. C. H. Channon, F.R.I.B.A., presiding. In reply to the toast of "The Royal Institute of British Architects and Allied Societies," Mr. W. J. Locke, B.A. (secretary, R.I.B.A.) spoke of architectural registration, and said that so long as any scheme was put forward which did not recognize as a basis the sixty years of strenuous work and diplomas of the Institute, so long would the Institute refuse to act; and whilst so many qualified members of the profession in England did not join the Institute, it would not be in a position to go before Parliament with a cry for registration.

Law Cases.

Insanitary Angles of Drains.—At the Marylebone Police Court on November 29th a case was heard in regard to the drainage of 70, Canfield Gardens, Hampstead, the plans for which (prepared by Mr. Mark H. Judge, A.R.I.B.A., F.S.I.) were objected to by the Hampstead Borough Council. The Council's Sanitary Inspector Edmonds took exception to the new drain as constructed from the soil pipe at the back to the inspection chamber No. 2, as shown by the drawing on the opposite page, and he wrote to Mr. Judge on September 6th stating that the work "is being carried out contrary to by-laws, and I must therefore ask you to give instructions for the drain to be laid with an even gradient from end to end." The new drain thus asked for by the inspector is 75ft. long, exclusive of the old drain which Mr. Judge proposed to retain between inspection chambers 2 and 3, shown thus:— ▪ ▪ ▪ ▪ ▪ ▪ ▪ Borough Sanitary Inspector Smith on September 13th served on Mr. Judge's client a notice under the Public Health (London) Act, 1891, calling for execution of the following works: "Take out the defective drains and construct a new water-tight drain from manhole in front of house to soil pipe at rear." The borough medical officer of health on September 13th wrote to Mr. Judge objecting only to the length of drain between inspection chambers 1 and 2. He said, "What is necessary is a uniform gradient from the one to the other, without perpendicular fall." The new piece of drain thus asked for by the medical officer is 29ft. long instead of the 75ft. asked for by the inspector on September 6th. Instead of "an even gradient from end to end" the medical officer thus consented to allow these different gradients as follows:—46ft. with a fall of 1 in 15; 29ft. with a fall of 1 in 5; 36ft. with a fall of 1 in 30. The new drain asked for by the medical officer is shown thus:— × × × × × × It will be seen that the new drain as put in by Mr. Judge is below the foundations of the house. His strongest objection to both requisitions of the borough council was that to comply with them would involve needless and serious disturbance of the foundations. He further maintained that the new drain as laid by him and shown on the accompanying drawing was a thoroughly satisfactory drain in every respect. He contended that it most certainly had "a suitable fall" in every part, and that the vertical part had a bend at its foot in the same way as the two vertical soil pipes have bends at their connection with the stoneware drain. At the hearing of the case the sanitary inspector, the medical officer of health, and the surveyor to the Hampstead Borough Council gave evidence, and said a suitable fall was not provided where a drain was vertical, and therefore the drain as put in by Mr. Judge did not comply with the new drainage by-laws made by the County Council, and which had been in force since June last. Mr. Judge gave evidence, and contended that as a vertical soil pipe provided a fall which was accepted by the Hampstead Borough Council as suitable, the same rule must apply to the vertical drain which had been constructed under his direction and to his approval. The magistrate (Mr. Curtis Bennett), in finding for the Hampstead Borough Council, said, "In my opinion a suitable fall is not obtained where a drain is vertical, and therefore that part of the drain must be taken out and be reconstructed." Mr. S. N. P. Brewster, solicitor, said that he was instructed to appeal, and he asked the magistrate to state a case. The request was refused on the ground that the question was one of fact.

The Portland Breakwater Appeal Case.—On December 2nd the House of Lords gave judgment on the appeal of the Government from the decision of the lower Courts in favour of Messrs. Stewards & Co., coal merchants and quarry owners, Portland. It will be remembered that the latter claimed that they had a contract to supply 2,000,000 tons of rough stone for the breakwater at Portland. They were, however, only allowed to provide 254,928 tons, the Admiralty ceasing to draw from them on January 15th, 1898. The Department had, in accordance with the decision of the Liberal Government in 1895, been building the breakwater by directly-employed labour; but the close of its dealing with Messrs. Stewards indicated a change of policy, the work being transferred to a contractor.—The Lord Chancellor said the difficulties were such that each side had been able to argue plausibly. The question was, what had they agreed to? In 1895 the Admiralty were proposing to build a new breakwater at Portland, and not far from the site was the respondent's quarry, with a large quantity of—he would not say rubbish, but he might say, without offending Sir Robert Reid, stone of such inferior quality that the owners had a double object in getting somebody not only to pay for it, but to remove it, because there was probably no other market for it, and its disappearance would assist them in getting at better stone. In his opinion, the Admiralty did not agree to take either 2,000,000 tons or the amount that would be required for the breakwater. The only definite contractional obligation was that the respondents should supply when demanded such quantities of rough stone at such times as the Admiralty might choose, the price being 4d. a ton. In moving that the appeal should be allowed and judgment given for the Crown, he did so with reluctance, because the Admiralty and a responsible firm of contractors ought not to have left the Courts to determine what should have been perfectly free from doubt. The other Lords Justices concurring, judgment was given for the Crown, the defendants at the same time being ordered to pay the costs of both appeals.

Tunnels for Wires under Streets.—In the Chancery Division of the High Court of Justice on November 29th the case of *The Walker Urban District Council* v. *Wigham, Richardson & Co. (Ltd.)*—*Wigham, Richardson & Co., (Ltd.)* v. *The Walker Urban District Council* was heard. These cross-actions raised important questions under section 26 of the Public Health Act, 1875. In April last the company constructed a tunnel or subway (without the knowledge or consent of the Council) under Fisher Street, Walker, Northumberland, and so connected their premises on either side of that street. Mr. Justice Farwell, in delivering judgment, said that the action had resolved itself into the question of fact whether the company's pipes in the tunnel they had constructed were part of or placed in any structure which the local authority were entitled to remove. It was admitted that the company were the lessees of the land on both sides of the street, and that consequently the subsoil belonged to them. The local authority did not claim the subsoil, but relied solely on section 26 of the Act. The company, being owners of the land on each side of the street, were minded to take electric mains from the one side to the otber. But the local authority themselves supplied electric light, while the company got theirs from a rival source, and the real object of the action by the local authority was to prevent the electric mains from remaining under the road. The company built a tunnel with an arched roof, and sides, and floor of concrete, unquestionably in contravention of section 26, as no permission had been obtained from the local authority. Instead, however, of laying their wires in the *alveus* of the tunnel, the company cut away the concrete floor in the middle. Here was where the testimony for the company came in. He held as a fact that the company did cut right down to the clay below, though an inch or two of concrete might have been left here and there. Two pipes were then laid on the clay, ond two others on the top of them; 15in. of concrete were then laid on the top. The local authority now claimed that they were entitled to remove the whole structure, including the floor and the pipes in or under it. In his view, where the pipes now were was not part of the floor or of the structure, and he agreed with the company's witness that the whole tunnel could be removed without interfering with the pipes. It was not necessary on that view of the facts to consider the question of *bonâ-fides*, but a serious question might hereafter arise how far a local authority was entitled to use its powers against rival traders. As the general result the Council was entitled to the declaration it claimed, while the injunction granted by Mr. Justice Buckley in favour of the company would continue. The Council must pay the costs of the action by the company, and the company the costs of the other action.

An Architect's Claim for Commission.—The case of *Thompson* v. *Tolhurst* was heard in the King's Bench Division of the High Court of

Justice on Thursday last. This was an action to recover commission. The plaintiff, Mr. James William Thompson, said that he was an architect, surveyor and land agent at Southend, and the defendant, who was a solicitor, was the proprietor of the Warrior Square Estate at that place. The defendant's affairs were conducted chiefly by his son, Mr. Bernard Tolhurst, who asked him if he could introduce lessees or purchasers, and said that the usual rate of remuneration would be paid. They agreed that there should be a fixed remuneration of 2½ per cent. for introducing a purchaser. As to leases, it was left to the usual terms, which were one year's rent. The plaintiff disposed of a plot to a Mr. Burdett, and the Hotel Victoria, of which plaintiff was architect, was built on it, and he was paid commission at 2½ per cent. in January, 1899. The plaintiff prepared plans for an hotel for another plot, and ultimately introduced Mr. F. D. Hayward; and the Hotel Metropole was built by him on the site. The plaintiff had received something under £3,000 as architect's fees for his five years' work. When he asked for his commission, the defendant's son said that the appointment as architect was the only remuneration to which he was entitled. A sum of £300,000 had been spent on the Hotel Metropole. The jury found a verdict for the plaintiff for £1,300, and judgment was given accordingly.

Correspondence.

Insanitary Angles.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In this age of the Universal Provider "Enquire Within upon Everything" may soon have to be announced over the entrance to our police courts. It speaks volumes for the character of our magistrates and the patience of our people that honesty of purpose has so long been accepted when it is patent to all concerned that the instrument of Justice is so often wanting in the technical knowledge without which an opinion is as likely to be wrong as right. When a sanitary inspector of a local authority differs from a qualified and experienced architect or engineer as to the inclination at which a drain should be laid, the Legislature, in its wisdom, has imposed upon our magistrates the duty of deciding between them, and thus it came about on November 29th, at the Marylebone Police Court, that Mr. Curtis Bennett decided that a new stoneware drain, bedded in concrete, proved to be sound and watertight and thoroughly well ventilated, should be taken out and reconstructed because he shared the opinion of the sanitary inspector that a pipe at an angle of 90 degs. with the horizontal did not give a suitable fall. Is this the discovery of an insanitary angle, or is it a gross interference with reasonable liberty? Because I constructed a drain with a vertical fall rather than endanger the foundations of the house by putting the drain several feet below them, can anyone seriously maintain that such a drain is, therefore, dangerous to health? If this cannot be maintained, has not the interference of the sanitary inspector reached a stage when some serious stand should be made against it?

The accompanying drawing shows the construction of the drain which has been condemned; also the soil pipe which is *not* condemned though it has the same "unsuitable" fall and is connected in the same manner to the same inspection chamber.—Yours truly,

MARK H. JUDGE, A.R.I.B.A., F.S.I.
Assoc. Society of Medical Officers of Health.

[A report of the case to which Mr. Judge refers will be found on the opposite page.]

Books on Elizabethan Architecture.

To the Editor of THE BUILDERS' JOURNAL.

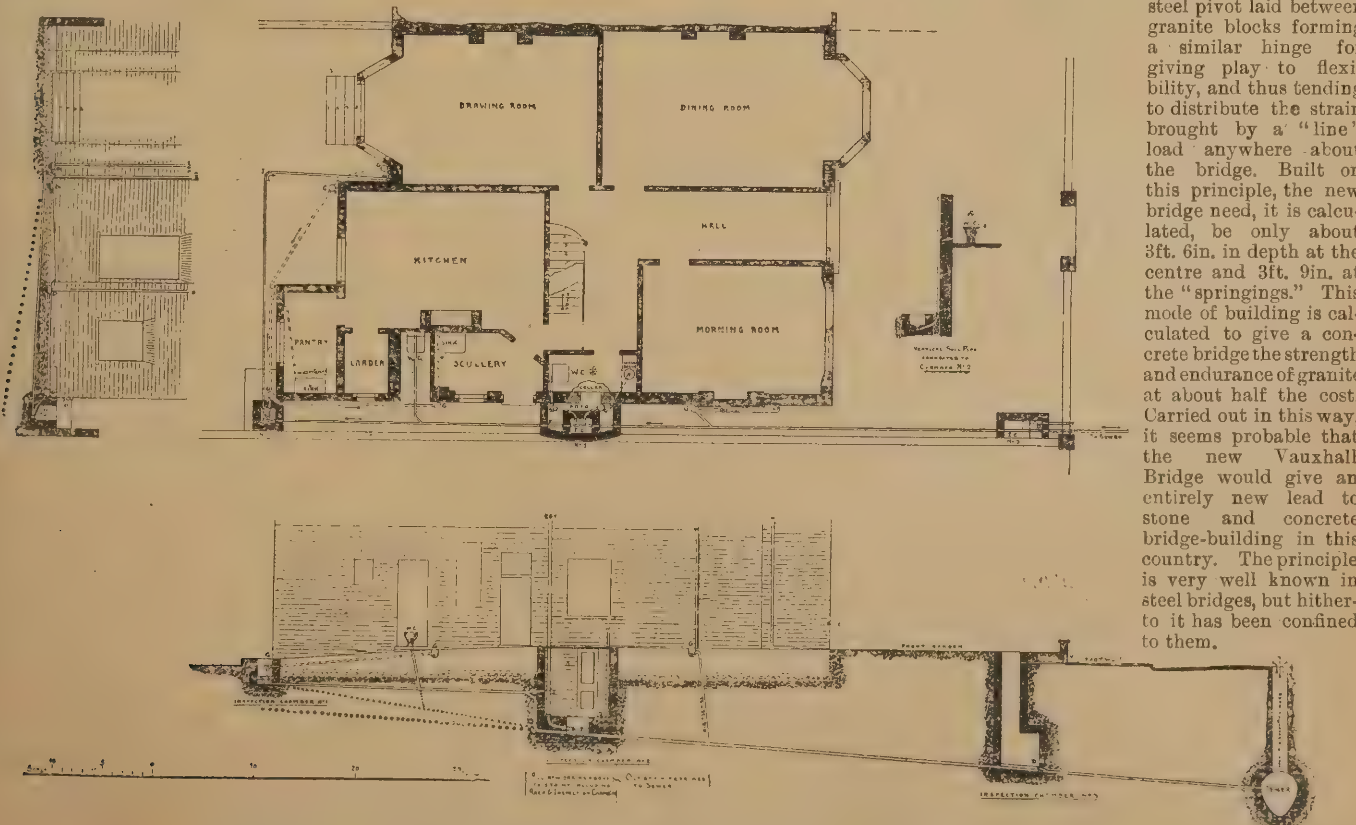
EXETER.

SIR,—Under this heading Mr. J. Alfred Gotch's new work on "Early Renaissance Architecture in England" was recommended in your last issue. In a review of this book which appears in the current issue of "The Antiquary" the following passage accompanies an illustration of the exquisitely-beautiful fifteenth-century font-cover at the church of St. Mary the Virgin, Pilton, in this county: "Font covers, with elaborate canopies from which they were suspended, are occasionally found of a Transitional character. Mr. Gotch gives a good instance (Fig. 1) from the church of Pilton, North Devon; the work on the top of the canopy is of later and coarser design. In the neighbouring church of Swimbridge there is a yet more remarkable fond-cover and canopy of similar date, which is not here figured." As a matter of actual fact, there is nothing of the sort! The spiral cover at Pilton is by far the fairest example of a fifteenth-century Perpendicular font-cover in the four south-western counties. The stationary triptychal font-cover at Swymbridge is quite a hundred years later—it is certainly not earlier than the middle of the sixteenth century. Pilton's font-cover has always been known as exceptionally pure fifteenth-century work. It is, therefore, more than a little surprising to find it illustrated as an example of "Early Renaissance Architecture in England." It is, however, perfectly correct that some early Renaissance panelling, &c., was put up behind this particular cover, and a canopy added by some admirer after the old cover had been *in situ* upon the font for more than a century.—Yours truly, HARRY HEMS.

VAUXHALL BRIDGE.

The System of Construction Adopted.

THE object of the new system of construction adopted for the new Vauxhall Bridge—at present embodied only in a model—is to give to stone or concrete bridges something of the elasticity which it has already been employed to give to steel structures, and by this means to permit of a great reduction in the necessary dead weight of the bridge and of the amount of material employed. If the new principle is finally adopted, each arch will consist of two distinct sections, divided from each other to the centre of the arch and from each abutment or pier. In other words, each arch will have a slit or division at either end, and another in the middle, instead of being one solid structure throughout. The bridge as a whole will be of concrete, but the ends coming together will be formed of solid blocks of granite. Across the width of the bridge there will be thirty-five of these granite blocks on each side of the slit. If these masses of granite were built into the bridge in the ordinary way, two rows of them would of course come together at the crown of the arch. But by this new system they are kept slightly apart by massive cast-steel pivots laid in sections between them. There is a steel groove let into the face of the granite on each side of the slit; and the steel pivot is laid in this groove, forming a sort of hinge between the two sections of the arch, paraffin wax being poured down into the groove to prevent corrosion. If a very heavy load is brought over a bridge the arches of which are constructed in this way instead of the fabric bearing up rigidly against the load, there is a slight flexibility. The crown of the arch is slightly depressed. The weight comes down upon the steel pivot in the middle of the slit and the pressure tends to distribute itself evenly throughout the arch. At each of the shore ends of the bridge there is a similar steel pivot laid between granite blocks forming a similar hinge for giving play to flexibility, and thus tending to distribute the strain brought by a "line" load anywhere about the bridge. Built on this principle, the new bridge need, it is calculated, be only about 3ft. 6in. in depth at the centre and 3ft. 9in. at the "springings." This mode of building is calculated to give a concrete bridge the strength and endurance of granite at about half the cost. Carried out in this way, it seems probable that the new Vauxhall Bridge would give an entirely new lead to stone and concrete bridge-building in this country. The principle is very well known in steel bridges, but hitherto it has been confined to them.



DRAINAGE OF 70, CANFIELD GARDENS, HAMPSTEAD; BY MARK H. JUDGE, A.R.I.B.A., F.S.I.

R.I.B.A. EXAMINATIONS.

November Pass List.

Of the 188 candidates admitted for the preliminary examination qualifying for Probationership R.I.B.A., held in London and the provinces on November 5th and 6th last, 37 were exempted, and the remaining 151 were examined with the following results:—

	Passed.	Relegated.	Total Examined.
London	59	15	74
Birmingham	8	3	11
Bristol	7	3	10
Exeter	3	4	7
Leeds	20	6	26
Manchester	17	6	23
	114	37	151

The names of the successful candidates, and of those exempted (making a total of 151 newly-registered probationers) are as follows:—W. L. Allen (Regent's Park), F. L. Atwell (Plumstead), H. J. Axten (Crouch End), C. H. Barlow (Widnes), J. J. Beck (Doncaster), A. L. Belcher (Brixton), W. T. Benslyn (Birmingham), H. E. Bernton-Benjamin (Windsor), A. Bolton (Bingley) A. Boulton (Dundee), T. Brameld (Hull), J. E. G. Burroughs (Bristol), H. Carnelley (Barnsley), W. Carver (City Road), E. S. Charlton (Tunbridge Wells), H. G. Cherry (St. Albans), C. Chippindale (Harrogate), H. H. Christie (West Kensington), W. T. Clark (Birmingham), W. T. Clarke (Liverpool), R. H. Cochrane (Dublin), J. Cocker (Timperley), G. S. Cockrill (Gorleston), H. R. Collins (Exeter), A. S. Constable (Stocksfield-on-Tyne), W. H. H. Cooke (Stroud), A. Cooper (Rickmansworth), F. C. B. Dabbs (Clapton Common), G. F. B. Daniell (London, S.W.), J. S. B. Davidson (Aberdeen), A. H. Davis (Kensington), F. M. Dean (Streatham), D. W. Ditchburn (Leytonstone), A. H. Douglas (Maida Vale), A. Douglass (Morpeth), G. B. Dransfield (Barnsley), W. T. Duncan (Rochdale), A. Dunn (Moseley), E. Edmonds (Stamford), A. H. Edwards (Leicester), A. C. M. Edwards (Rickmansworth), E. S. England (Blackpool), H. L. Etherington-Smith (Putney), E. W. C. Faulkner (Freshfield, Liverpool), W. G. Fearn (Clacton-on-Sea), H. Fielding (Accrington), A. H. Fitz-Roy (Lincoln), F. B. Foster (Leamington), H. J. Fox (Stamford Hill), D. S. Gardner (Weston-super-Mare), J. H. Goodchild (Crouch End), B. R. Gribbon (Leeds), A. H. Gully (Bedford), R. W. Gunson (Manchester), B. G. Gwyther (Egham), G. Hanson (Bradford) F. H. Healey (Bradford), J. H. Higgs (Leicester), H. H. Hill (Liverpool), J. R. Hobson (New Eltham), J. N. Horsfield, junr. (Kingston-on-Thames), W. H. Huckvale (Tring), A. H. Kirk (Pall Mall), F. R. Jolliffe (Penarth), B. W. Jones (Bexhill), G. H. Jones (Cardiff), L. de Barr Kelsey (Kensington), A. W. Kenyon (Sheffield), A. S. Killby (Highbury), C. U. Kilner (Bayswater), S. J. Lampshire (Devonport), A. A. Langham (Wimbledon), H. Langman (Southport), H. B. Laycock (Manchester), H. G. Lay (Wellingborough), T. Linton (Leith), J. H. Lowry (Liverpool), P. J. Maffey (Southampton), E. H. N. Major (Mecklenburgh Square), H. W. Markwick (Devonport), R. H. Mason (Birkenhead), F. J. Matthews (Clapton), M. G. St. John Maule (Huntingdon), F. C. Mears (Edinburgh), E. H. Mills (Shrewsbury), H. G. H. Mills (Southsea), A. M. Millwood (Barnes), E. Milnes (Rochdale), S. W. Mobbs (Lowestoft), E. Morley (Bradford), P. W. Mulready (Brondesbury), F. T. Negus (Woburn), W. H. Nevell (St. Albans), G. E. H. Newbold (Gainsborough), J. Norquoy (Chorlton-cum-Hardy), D. Mary O'Connor (Southall), S. S. Parkinson (Gravesend), G. Pemberton (Edgbaston), G. E. Peto (Bath), G. E. Phillips (Cambridge), A. P. H. Pierce (Auckland, N.Z.), A. E. Poley (Hampton Hill), W. D. Quirke (Camden Road), N. L. Reid (Leicester), A. G. E. Rebbeck (Frome), H. J. Roberts (Portmadoc), R. G. Roberts (Doncaster), A. H. Robinson (Birmingham), B. Royce (Leicester), W. P. Rylatt (Hull), H. Shackleton (Keighley), W. H. Shute (Newport, Mon.), E. H. Smith (Leicester), J. W. Smith (South Hampstead), J. C. Smythe (Mutley, Plymouth), R. G. Stevens (Bromley), J. D. Stevenson (Redhill), R. Stockton (Stockport), R. Stokoe (Sunderland), H. S. Stowell (Croydon), P. M. Stratton (Salisbury), L. W. Taylor (Newcastle-on-Tyne), C. E. Tebbs (Upper Tooting), F. W. Tempest (Sutton-in-Ashfield), E. E. Temple (Upper Norwood), C. à Beckett R. Terrell (Tonbridge), R. A. Thomas (Gosport), M. Thompson (Doncaster), G. M. Trench (East Dulwich), J. R. Truelove (Sharrow, Sheffield), R. F. Tucker (Upper Teddington), J. T. Turner (Wanstead), H. G. Turner (South Croydon), M. J. Wadsley (Hull), P. F. Warren (Norwich), A. J. Watson (Newcastle-on-Tyne), B. Watson (North Shields), R. F. Wheatly (Bromley), H. E. White (Moseley), R. W. White (Kentish Town), A. H. Whyte (Kensington), T. S. Wilcockson (Chesterfield), L. Wilkinson (New Southgate), H. A. Willatt (Nottingham), E. J. Williams (Leicester), J. R. Wills (Derby), R. H. Willson (Kingston-on-Thames), J. D. Winder (Wandsworth Common), A. T. With (Anerley), W. O. Wright (Morecambe), J. A. Yells (East Dulwich).

Intermediate Examination.

The intermediate examination, qualifying for Studentship R.I.B.A., was held in London, Bristol, Leeds and Manchester, on November 5th, 6th, 7th and 8th, with the following result:—

	Passed.	Relegated.	Number Examined.
London	29	23	52
Bristol	5	4	9
Leeds	3	4	7
Manchester	8	3	11
	45	34	79

The names of the successful candidates are as follows (in order of merit):—A. Scott (Glasgow), C. M. Crickmer (Regent's Park), H. W. Asman (Bradford), W. F. C. Holden (Cambridge), C. H. Brightiff (Southampton), W. J. Freeman (Halifax), A. Gilpin (Bristol), E. L. Hampshire (Rye Hill Park), V. C. Cook (Wolverhampton), D. Anderson (Hampstead), J. E. Mundell (Poole), C. B. Cleveland (Cambridge), B. D. Tracy (Camden Road), J. H. Taylor (Battersea), J. Wilcock (Bradford), C. P. Moss (Crouch Hill), H. Slater (Preston), K. D. S Robinson (Westminster), C. H. Heaton (Wigan), H. R. Crabb (Exeter), W. B. Colthurst (Taunton), A. R. Crisford (Eastbourne), P. A. Horrocks (Bolton), E. M. Ellis (Fenchurch Street), P. R. Strong (Balham), F. Sykes (Manchester), F. G. Brooker (Peckham Rye), W. T. Curtis (West Dulwich), S. H. Rainforth (Lincoln), J. W. Jarvis (Moseley), H. W. Stone (Taunton), J. T. W. Brooke (Bowdon), R. W. A. J. Cosway (Wandsworth), E. Harding (Brixton Hill), Florence F. Hobson (Belfast), E. R. Kennedy (Belfast), S. Maddock (Frodsham), L. Morris (New Brompton), B. S. Murphy (Edinburgh), W. R. Osborne (Swindon), F. J. M. Owen (Liverpool), S. H. Penlington (Sunderland), E. R. Sladen (Bourne End), J. B. Smith (Bedford), C. J. Thompson (Wandsworth).

Final and Special Examinations.

The final and special examinations, qualifying for candidature as Associate R.I.B.A., were held in London alone from November 15th to 22nd. Of the 63 candidates examined the following 35 passed, the others being relegated to their studies:—C. T. Adshead (Stockport), S. W. Bensted (Wandsworth Common), E. G. Besant (Cambridge), A. E. Biggs (Felixstowe), A. B. Botterill (Streatham), C. A. Broadhead (Nottingham), H. Busbridge (Plumstead), R. S. Cockrill (Great Yarmouth), W. J. Devlin (Adelphi), W. E. Dobson (Hampstead), W. W. Ellison (Erith), J. Ewing (Regent's Park), E. L. Gaunt (Ilkley), A. E. Gibbins (Islington), F. R. B. Haward (Marylebone), R. E. Hemingway (Nottingham), A. E. Hughes (Regent Street), A. T. Hussell (Ilfracombe), E. W. Lees (Mecklenburgh Square), H. L. E. Merille de Colleville (Brighton), E. B. Norris (Birmingham), L. R. Oakes (West Kensington), H. F. Ponton (Hammersmith Road), W. B. Rees (Cardiff), C. H. Reilly (Victoria Street), F. G. Richardson (Tufnell Park), E. G. Rodway (Weston-super-Mare), G. L. T. Sharpe (Barnes), W. Slater (Nottingham), F. D. Smith (Victoria Street), T. M. Smith (Tollington Park), W. S. Tucker (Newmarket), A. H. Verstage (Camden Square), J. A. Woore (Derby), E. L. Wratten (Croydon).

The following shows the number of failures in each subject of the final examination:—

I. Design	23
II. Mouldings, &c.	18
III. Materials	11
IV. Sanitation	13
V. Specifications	1
VI. Construction: Foundations, walls, &c.	11
VII. Construction: Iron and steel, &c.	10

The Ashpitel Prize.—This prize has been awarded to Mr. C. T. Adshead (Probationer 1894, Student 1897), he having most highly distinguished himself in the final examinations this year.

A Special Prize of books (value £10) has been awarded to Mr. F. Dare Clapham, in recognition of the merit displayed by him in his work at the special examination held last June. Mr. Clapham obtained the highest number of marks ever awarded at the final and special examinations.

UNDERGROUND TRAMWAYS.

THE L.C.C. REPORT.

The London County Council have just issued the joint report made by their tramways manager (Mr. Alfred Baker) and their electrical engineer (Mr. John H. Rider) on the construction and working of the Boston underground tramways and the Rapid Transit Subway now being constructed in New York; with an addendum by Mr. J. Allen Baker, vice-chairman of the Highways Committee. The main facts about these tramways have already been published in our columns, but the report affords some interesting particulars of the methods of construction adopted at Boston. The subways there are of three distinct types. In the first, the side walls and the arch are of masonry, a single wide arch covering the whole subway. In the second there are two distinct tunnels side by side, each built of masonry. In the third upright steel columns for the side walls and transverse steel girders for the roof are used, with masonry and concrete around and between them. The open inclines leading to the surface roads have granite walls, and are protected by railings. The standard height of the roof is 14ft. clear above the surface of the rails, and the roof is generally about 3ft. below the street-surface. In some places, however, the subway is considerably lower than this. One of the most important differences between a shallow subway and a deep-level tube, from the point of view of the travelling public, is well illustrated at Boston. Instead of having to descend a very great number of steps or enter a lift in order to reach the cars, passengers use a short well-lighted stairway, having from twenty-five to thirty steps. Persons can thus descend to the platforms or ascend to the street in a very few seconds.

In New York, instead of the arched roof and massive masonry walls of an ordinary underground railway, the plans of the Rapid Transit Commission call for a structure rectangular in shape and built in an open trench. On a concrete bottom will be erected, at intervals of 5ft., running across the line of street, frames of steel beams securely riveted together. Between these frames, or ribs, will be built a concrete wall and a concrete roof of sufficient thickness to enclose the steel structures entirely. In addition to the side walls thus formed, the roof will be supported by rows of light steel columns between the tracks. The contract price for the construction of the subway was £7,000,000. Mr. Baker and Mr. Rider express the opinion that by the construction of shallow underground subways in London two important objects would be gained: (1) A method of linking up existing tramways by taking surface cars underground through congested and, what might be termed, prohibited areas. (2) A provision for pipes, cables, wires, &c., which would obviate the continual breaking up of the streets. The ideal form of transit, in their opinion, is the one proposed in New York—a subway, easy of access from the street, catering for express and local traffic (as explained on p. 239 of our issue for November 20th last).

A New Hotel at Bath, named "The Empire," has been opened by Messrs. Spiers & Pond, Ltd. It is built of Bath stone, and is the largest in the city, providing for over 200 visitors. The architect was Major C. Davis. There is the usual open lounge and spacious reception-rooms and corridors, and also ten complete private suites in the building, which has been erected by Messrs. J. Long & Sons, of Bath. The furnishing has been carried out by Messrs. Smee & Cobay, of New Bond Street, W.

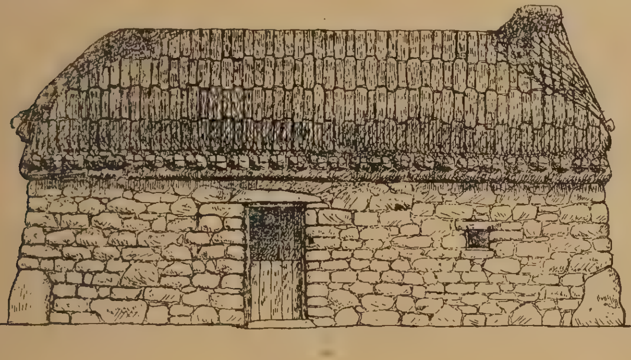
BUILDING CONSTRUCTION.

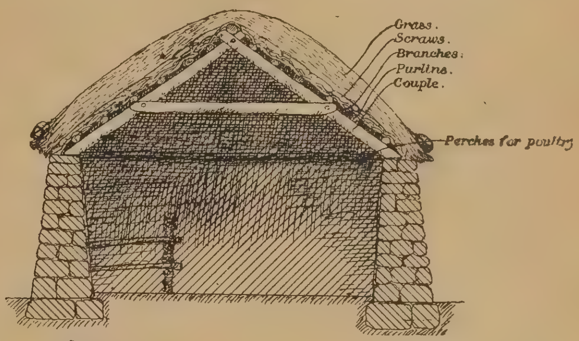
(*Continued from p.* 286 *of No.* 356.)

53. THESE articles on forces applied to structures go a very short way, but they go far enough for the *needs* of a practical man, who, if he is curious in this direction and has a taste for mathematics, may go as much further as he likes. In my endeavour to be practical I have written from my own experience of the kind of calculations which arise in ordinary office-work. The subject is a department of mechanics. I have tried to pick out, without any show of want of sequence or incompleteness, the questions which arise in building construction. The student may reasonably assume that if he studies these articles and understands them he will be prepared to deal quantitatively with any strength question, moderately determinate, likely to arise in building practice. It is surely of advantage to have the essential things selected and put in concise order. We know that the pendulum of a clock does not fulfil all the conditions of a "simple pendulum," but it keeps time with sufficient accuracy for practical purposes. We know that no two separate pounds of sugar weighed out to customers by a grocer are of exactly the same weight, and that no two separately cut yards of cloth sold by a draper are of the same length, but the weights and lengths are practically correct. It is not sought to be conveyed that any carelessness of estimate or measurement is pardonable; this is not so. The test of accuracy in a clock's pendulum is that the clock will keep time; of the grocer's and draper's accuracy, that their customers reweigh and re-measure and are satisfied, and that the quantities sold agree in their totals with the quantities which the grocer and draper bought wholesale. A constructor must design safely and economically.

The few principles which have been illustrated and dealt with are of very frequent application in very different ways, but the student must not for a moment think that they are restricted to the cases given. For example, some of the considerations in connection with beams fixed at one end apply to a pillar to which a heavy gate is hung, or to a wall or chimney in a wind. The question of distribution of pressure between surfaces which has been considered in reference to arch voussoirs, and again the same principle in connection with the consideration of the centre of pressure at cross-sections of struts, is one of very wide application. But it is not necessary to multiply instances.

These few words must not be taken as any "farewell address" to force calculations. On the contrary, the student has been introduced to principles which it is to be hoped will remain in his mind for everyday application and extension. It is to be feared that building students have not hitherto had their attention sufficiently directed to this *fundamental* part of their work.





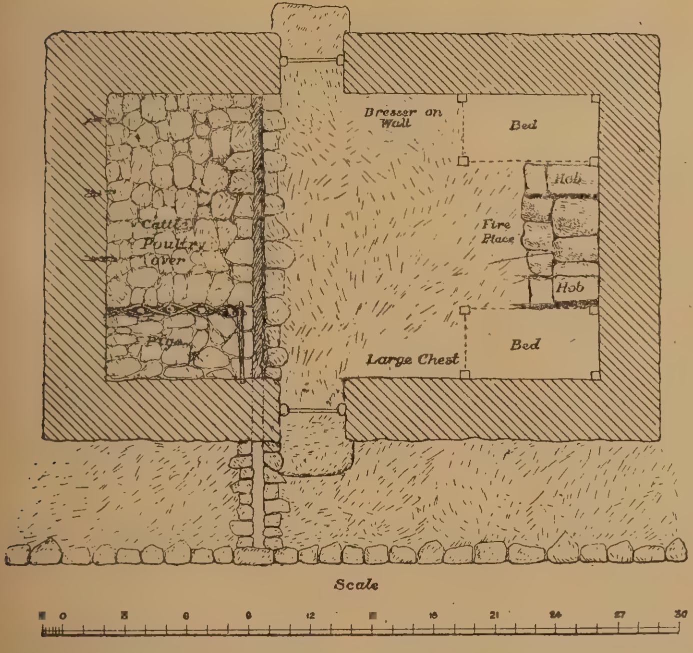


FIG. 76

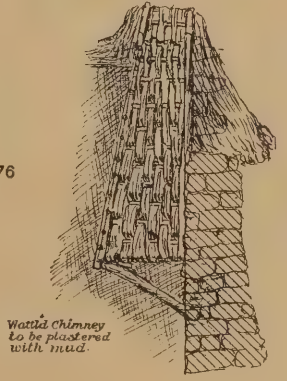

Wattld Chimney to be plastered with mud.

House-building.

54. There is no human construction that does not exhibit care and carelessness, wisdom and lack of wisdom; and it is the business of the student to see both sides and to profit by what he sees. The new syllabus for the South Kensington examinations suggests that the natural course of building education is to commence with elementary buildings and to proceed from these to more complex buildings, or, as a naturalist might express it, to buildings showing high specialization of function. There are minute animals called amœbas, which consist of small sacs with a hole or opening. They appear to be simple detached stomachs: they may be turned outside in, and it is found that they thrive just as well, and what was the outside skin is found to perform the functions of digestion and the previous inside stomach-surface equally well serves for an outside skin. The simplest kind of house or shelter is probably the piece of bark with which the Tierra del Fuegan shields himself from the cold wind as he moves about. The Australian blackfellow sets up three pieces of bark to shelter his head and shoulders when he sleeps. We are aware that we skip a large number of terms in our advancing series when we take a Connemara cabin (Fig. 76) as our starting-point for the study of house-building. We are further discriminating, because our Connemara cabin is a specially good example and we shall find admirable construction points in it. The builder of this cabin has as good grounds for pride in his work as the builder of many more pretentious houses. In judging a man's work we must take account of all the circumstances. This single-roomed house to shelter the Connemara peasant and his live-stock is what he can afford, and it must be made of such materials as he has at hand. In some places he cannot get lime within miles of his house, and so he must build with very little lime. The walls are dry-built of granite (in the house shown) and the inside is pointed and rough-plastered with mortar; when it can be afforded the outside is also pointed, and when this is done the house is fairly warm and comfortable—warmer than a solidly mortar-built house because the air enclosed in the dry walls is a non-conductor. The house has two doors, as some people think (and, indeed, as the people who live in the house will tell you), so as to use either side for entrance when it happens to be the lee side. There is something in this, because if you observe the window you will see that an open door is needed to give light; but the two opposing doors have another function—the peasant's small growing of oats is winnowed on the floor in the current of wind between the two doors. We, pampered people, know that a door opening directly from the outside is a draughty arrangement, and we protect ourselves with a porch and second door. It is still more draughty to have these two badly-fitting doors opposite to one another, and to mitigate the draught the closed-up door is lined inside with a plaited-straw mat (*sugan*, a paillasse), which is held up close to the door and the side chinks with raking props. The enclosure for the pig must be very strongly paved and secured, because these animals can perform wonders of destruction with their snouts. The fastenings for the cattle are hooked branches of bushes built into the wall. The bed mattresses are *sugans*. Other sitting accommodation is provided by stools (not shown). The principal table is the lid of the chest; the dinner is potatoes, and the dinner-table is a flat basket placed on a bucket or stool. The roof is peculiar; the thatch is not of straw, and it is not secured with scollops. There is not much straw available, and scollops are not to be had; hazel bushes do not grow within twenty miles of this house. Note the network of roping and the row of stones along the eave. The foundation for thatch is prepared in the usual way: that is, a few collar-braced rafters (couples), pegged together with wooden pegs, are set up, then some rough branches are laid across them, and over these small branches are laid, lying up and down the slope of the roof. On these are laid "scraws," which are sods of a suitable kind skinned off the land very carefully and carried to the house in large rolls—one of these scraws may be 2ft. wide and 10ft. long. The thatch is coarse sedgy grass, laid on carefully up and down the slope of the roof in sufficient quantity to give the proper contour, without any fastening; it is held in its place by the network shown. In

many of the cabins the work is badly done; ordinary straw-thatching is apparently imitated and the side of the roof is given a plane surface. Now it is easy to see that if there is not a rounded surface the network cannot give support or pressure to the grass thatch, and flat thatching is therefore bad and unscientific. The cords are mostly twisted, made from the same grass which is used for thatch; but cocoanut-fibre string is not uncommon—it stands the weather well and it is lasting. A rounded waggon-shaped roof is successful in this case, for much the same reason that it is successful as a felted roof. If you cover a flat piece of boarding with felt, any wind that gets inside (through a door or other opening) lifts the felt off the boards, the nail heads pull through and the felt is carried off. With a waggon-roof it does not lift off; any attempt to lift at any part tightens it against the boards at every other part, and the friction against the boards helps the nails to keep the felt in place. The drawing shows the strings held down by stones along the eaves; they are quite as frequently fastened to pegs driven into the walls below the eaves. The drawing also shows the thatch covering the ends (the roof hipped) of the house, the gables. This is not the most common way, but it it is the best way. With ordinary thatch a gabled house has the barges made to the thatch with mortar, and some care is taken with mortar flashings to the chimney stacks. This cannot well be done with loose grass thatch, and, as commonly done, the barges are a very unsatisfactory job; the method shown is quite good. This is the necessary kind of roof where the walls of the house are of dried mud (whether thatched with straw or grass), and with mud walls the eaves must be more projecting than as shown. If we take full account of all his surroundings, the builder of one of these humble dwellings may be a brother member of our craft who is fit to hold up his head among us.

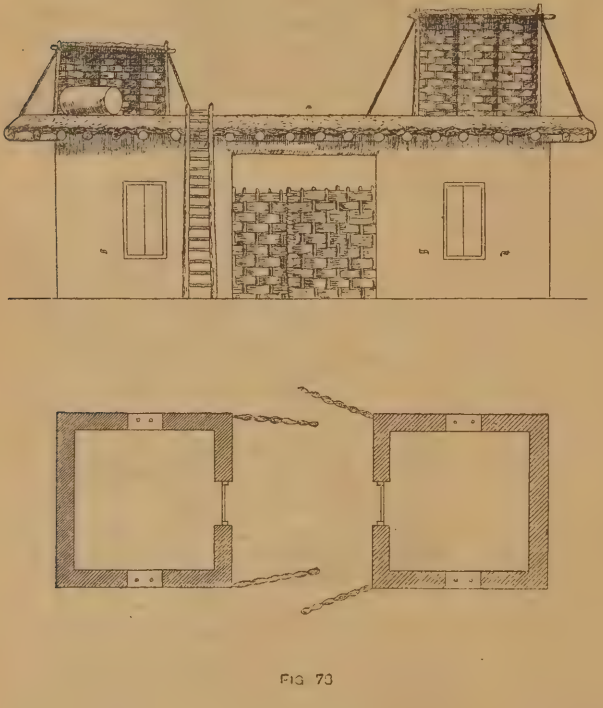

Fig 78

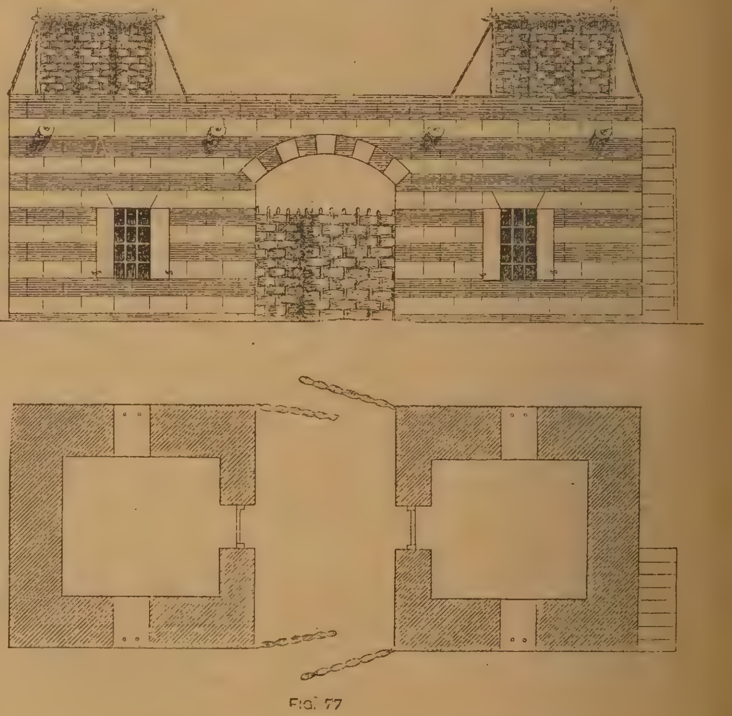

Fig. 77

55. Let us watch a man thatching with wheaten straw. He is putting on a "new coat" of thatch; he has moved his ladder, which lies evenly on the old thatch, and now marks the extent of the strip he is about to lay. The edge of the work he has before completed is kept from spreading by a number of straight scollops (hazel rods) stuck at right angles to the roof close to the edge of the new straw; he takes a handful of wheaten straw, regulates the butt ends with the palm of his right hand while he lays it in its place, then another and another, till he has as much as a scollop will properly span; he bends his scollop into a flat staple and thrusts it into the old thatch, enclosing the new. A second scollop brings him to the side of the ladder, then he takes a third and a fourth scollop, bends them sharp in the middle and pushes them in so as to hold fast the centres of the first pair; he lightly settles the scollops with his mallet, and repeats the operation till he reaches the ridge, where, if he is an artist, he finishes in looped and twisted handfuls of straw which are made fast by scollops in the loops in a way to remind one of the dowelling of roll ridge-tiling. The operation is exceedingly simple. Why does not the small farmer or peasant do his own thatching? Why also does he not make his own baskets and heather brooms or besoms? How many of us know the difference between a granny's knot and a reefing knot? Can anybody but a shopman make up a neat paper parcel? If we are to control workmen we must have their respect; if we are to have their respect we must understand their work. We must not only know bad work; we must know why it is bad work. We can only come to this knowledge by effort, and by becoming familiar with workmen, watching them intelligently at work and occasionally taking a hand ourselves.

56. Fig. 77 shows a Syrian house built of stone, such as may be seen in the neighbourhood of Beyrout. Because timber is expensive the walls are thick, and the roof is formed by vaulting. The face work is ashlar in alternating bands of light-coloured and dark-coloured stone. The roof is flat, and has a parapet. There is an outside stone stairs, and there are two shelters formed of cane mats on the roof (except in the rainy season the roof is the sleeping place). The opening through between the rooms is really the living room, and is designed for draught and coolness; the cane mats shown enclose the place and give privacy to the family. The windows are barred openings which may be closed up by the shutters shown. The way in which the centering for the vaulting is formed is as follows: Some pieces of timber are put up on sufficient supports, either timber or temporary dry walling—hewn pine pieces, kept to be let on hire for this purpose and charged for if cut or damaged in any way—the spaces between the planks are spanned with spauls of stone, and this is covered with mud which is worked to the shape of the vault. When the mud has dried so as to be fairly stiff it is covered with sand which is pressed firmly, and on this the sheeting is worked. It was a common plan in our own country to use wicker hurdles as lagging for vaulting. This house has a low parapet, four gargoyles are shown, and it has the usual flat roof of a Syrian house. There is no chimney. Cooking is done over small charcoal fires kept bright by the use of a feather fan, and only alight when they are required for cooking. Why are these roofs flat? What is the use of the small stone roller to be seen on every housetop (shown in Fig. 78)? The reason for the roofs being flat is very simple and natural: the roof is of clay or of a mixture of clay and lime, and it must be flat to prevent strong currents of rainwater washing it into channels and destroying it. The roller is for rolling the roof to close up cracks and generally consolidate and make the roof good during the "welcoming month" before the rainy season sets in.

57. Fig. 78 shows a house of the same character and giving the same accommodation as Fig. 77, but it is built of unburnt sundried mud blocks instead of stone. Houses of this kind are to be seen at Zahleh in Lebanon, where the eastern slope of Gebel Sunnin approaches the plain of the Bukaa. A brawling stream from the mountains runs through the little town, and on its banks some poplars grow; these poplars appear to furnish the poles to carry the clay roof. There are many other places where the houses are of mud (Damascus is a mud-built city). The poles are cleared of their bark, and when one gets inside the building he finds that peeled small branches have been laid to form simple patterns lying on the poles, showing appropriate ceilings having a good decorative effect. The doors of these houses have wood hinges; they are fastened with wooden locks which are opened with wooden keys. The projecting eaves protect the mud walls from being washed by the heavy rains of the rainy season. Fig. 79 shows one of these locks with its key. The "Encyclopædia Britannica" says: "The earliest lock of which the construction is known is the Egyptian, which was used four thousand years ago." This is the common lock used on the doors of these Syrian houses.

58. Have such elementary buildings any architectural value? The Eastern houses between which and the Connemara cabin some comparison is suggested are not nearly the poorest kind of dwelling to be seen in Syria. There is evident intentional efforts at decoration, and they also have a satisfactory effect when seen from a distance. A village of these houses built on rising ground, placed as the houses of Eastern villages are, without any regard to regularity in respect of road or street and mixed with the green of a few mulberry bushes or similar things, is a very pleasant sight. The builder of such houses has very little room for the display of originality; he works to a cut-and-dry design, a type as permanent as the dress which poverty makes unchanging in countries where people can barely live. Yet in such houses there is room for the display of taste and skill.

I must not be understood as saying that habitations like the Connemara cabin are satisfactory for human beings to live in. We have a Public Health Act, and we have sanitary

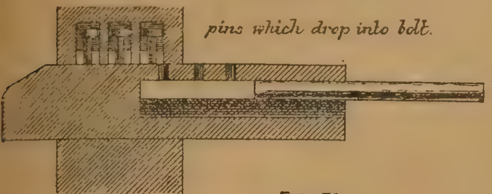

FIG. 79

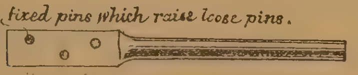

KEY

officers and inspectors, and we have laws by which the district council may build suitable houses for labourers; but these remedies do not touch, in any practical way, the evil. Where the ratepayers of a district are all equally poor, they cannot collectively help each of them to a new house with reasonable accommodation for animals and separation of the sexes. Our political conscience has reached a point at which it is allowed that civilisation may say, without suspicion of Socialism, "We will not allow the owner of a soul to die of hunger." Education is the present cry, and we want every educatable citizen educated, as a measure to sustain the nation in industrial competition with other nations. How can we hope to educate people who live in houses of this kind? I shall not be sorry when the public conscience reaches the further point—that every owner of a soul is entitled to Christian shelter and means of decency. The Congested Districts Board has made roads into districts hitherto inaccessible, and it has built some houses, but for want of funds it is not able to move with a very small fraction of the speed necessary for the work.

(*To be continued.*)

Engineering Notes.

A New Laboratory for Electrical Engineering.—In the basement of the Royal School of Art Needlework, now being completed at the corner of the Imperial Institute Road, is a new laboratory which, when completed, will give to the Central Technical College an up-to-date equipment for the teaching of electrical engineering, and will once again place the college in the foremost position among the higher technical schools in this country.

Institution of Civil Engineers.—At the ordinary meeting on Tuesday, the 3rd December, 1901, Mr. Charles Hawksley, president, in the chair, the monthly ballot resulted in the election of one Member—C. E. Allan (Belfast); forty-three Associate Members, namely: R. B. Addis, F.C.H. (Bombay); T. M. Aitken (London); W. R. Baldwin-Wiseman (London); C. B. Blackburn (Wolverhampton); R. W. A. Brewer (Glasgow); W. Broadbridge (Penang Straits Settlements); C. Brown (Bedlington); G. E. Clarke (Sheffield); W. L. Craig (Melbourne); W. H. Davis (London); E. Dodd (Birmingham); J. R. Elliott (Nottingham); G. Ellson (London); J. Foley (Carlisle); C. F. Franks (London); H. W. Hanbury (London); W. S. Harrison (Hong Kong); W. Jamieson (Liverpool); F. W. Jones (Derby); S. C. Jones (Swansea); J. R. Laing (Leith); G. C. Laurie (India); A. Leitch (Port Glasgow); A. E. Marrian (London); E. S. Martin (Calcutta); W. G. Morris (Dartford); A. H. Ough (Hong Kong); A. D. Pack-Beresford (Sheffield); F. J. Rodwell (Leeds); C. H. Rudge (Chester); L. Sikes (Harrogate); C. F. Slade (Melton Constable); J. McFall Smyth (Keighley); G. Stirling (Melton Constable); G. Stow (Shoreham); J. D. Stuart (London); G. Swayne (Guildford); E. A. Tarrant (London); O. V. Thomas (Dursley); C. K. Trubshaw (Derby); W. H. J. White (Cheltenham); A. Wyatt-Smith (Cape Colony); and G. F. Zimmer (London); and six Associates, namely: J. H. Armytage (London); R. M. Barklie, Brigadier-Gen., R.E. (Andover); B. E. D. Kilburn, M.A. (London); A. E. A. Maia (Rio de Janeiro); H. C. Travers, Lieut., R.G.A. (Jersey); J. Winn, Major, R.E. (Chatham).

Keystones.

A New Church at Shotton, Flintshire, is in course of erection.

The New Town Hall at Ilford was opened last week. The building has been erected at a cost of about £30,000.

Mr. S. Inskip Ladds, A.R.I.B.A., of 7, Doughty Street, W.C., has opened a branch office at Market Place, Huntingdon.

Mr. Alfred Waterhouse's Retirement.—It is stated that Mr. Alfred Waterhouse contemplates retiring from the Treasurership of the Royal Academy, (if, indeed, he has not already done so)—this on account of his health.

A New People's Hall for Shepherd's Bush is being erected in Olaf Street, Latimer Road, by the Nonconformist bodies in the district. The hall includes a number of club-rooms, and will cost £6,846, of which sum £1,910 has been paid for the site.

Mr. Norman Shaw, R.A., has sent in his resignation from the Academy, apparently with the intention of retiring after his long career and giving place to younger men—a most laudable action. Mr. Watts has for some years been an Honorary Retired Academician.

M. Alexander Léon has been chosen by the directors of the Beaux-Arts as the artist most fitted to carry out the ideas of the late Puvis de Chavannes in regard to the beautiful frescos of the Pantheon, which remain unfinished in consequence of that painter's untimely death. For fifteen years M. Léon was the intimate friend and devoted collaborator and disciple of the master, and his own decorations at Courbevoie serve to show that he is the right man in the right place.

A New Church at Loxwood has been erected. It is built of light bricks with stone dressings, tiled roof of darker hue, and simple interior. There is a tower with a spire of Sussex shingle. The cost of the building is approximately £2,500. The ground around it has not yet been laid out. One of the most interesting features is the retention of some ancient oak pews in use at the old church; these are at least 400 years old. The architect is Mr. Rowland Plumbe, F.R.I.B.A., of Fitzroy Square, London, and the builder Mr. Spooner, of Loxwood. The building is heated on the most modern principles, and lighted by lamps. The church is capable of holding 300 persons.

Views of London Buildings.—Messrs. Marion & Co., of 22 and 23, Soho Square, W., send us Nos. 9 and 10 of their series of illustrated booklets—"The Empire; Its Cities, Palaces and Buildings." Each contains sixteen half-tone reproductions, 10in. by 8in., admirably printed, accompanied by descriptive notes of the buildings. No. 9 shows "Famous Buildings of London," while No. 10 is devoted to St. Paul's Cathedral. Of the other numbers published, No. 1 deals with Westminster Abbey, No. 5 with Windsor Castle, No. 7 with the Houses of Parliament, and No. 8 with the Tower of London. The illustrations are from most excellent photographs and form a useful and highly interesting series. The price of each number is only 6d.

Architectural Association of Ireland.—At an ordinary general meeting of this Association held at Dublin on December 3rd (Mr. George F. Sheridan, presiding), two short papers were read. The first, by Mr. E. Bradbury (one of the hon. secretaries), dealt with Northamptonshire as a field for sketching and study for architects, in the course of which the lecturer described (and in some cases illustrated by sketches) a large number of churches and old houses in the villages and towns of Northamptonshire. In proposing a vote of thanks to the lecturer, Mr. F. G. Hicks suggested that it might be possible to arrange that a party made up of members of the Association should visit some of the places described during the ensuing summer, a proposal which met with considerable approval. Mr. T. E. Hudman gave a short lecture on "Architectural Odds and Ends," in which he described a few strange experiences he had had whilst on sketching trips, and also some interesting but very little known facts in connection with matters of an architectural nature.

All Saints' Church, Ladysmith, South Africa, is proposed to be enlarged by the addition of north and south transepts and extension of the chancel at a cost of £3,300.

Mr. Charles Villiers Wilson, architect, of 31, Saughall Road, Chester, died last week of heart disease. Mr. Wilson was about fifty years of age.

A Painted Sketch for a Ceiling, by Sir James Thornhill, representing an incident in the life of St. Francis, has been presented to the National Gallery by Mr. Charles W. Dopson, and is hung in Room XIX.

St. Mary's Church, Elloughton, has been re-opened after renovation and improvements. A new chancel screen of oak, elaborately carved and costing about £300, has been erected from designs by Mr. Temple Moore, of Westminster and Driffield.

New Cottage Homes for Beaminster.—Mr. Peter Meech, who is a native of Beaminster, Dorset, has communicated to the authorities of that town his intention to erect and endow a set of cottage homes. The benefaction is worth about £5,000.

Garden City Association.—The third annual report states that very satisfactory progress has been made by this Association, due almost entirely to the five months of active propaganda. The number of members on the books is at present 530, as compared with 325 last year, but the numerical growth is by no means representative of the increased strength of the Association, as the majority of those who have recently identified themselves with the movement are men and women of considerable influence and eminence.

The Tower of Yatton Church, Somerset, was re-dedicated recently. Some time ago the tower and some of the parapets were found to be in an unsafe state, and Mr. Detmar Blow, on behalf of the Society of Antiquaries, reported that the tower could be repaired and made as efficient as if rebuilt, but Mr. Edmund Buckle (diocesan architect) unfortunately reported strongly in favour of re-building, and this latter course was at length adopted, and the work has been carried out by Messrs. Merrick & Son, of Glastonbury, who have preserved as much of the original stone as possible.

The Cuckfield Rural District Council are erecting new offices in the Boltro Road, Haywards Heath. The building is to be faced with local red bricks, with Bath-stone and terra-cotta dressings. The accommodation comprises dwelling houses, on either wing, for the surveyor and manager of the Council's waterworks, with offices for these officials and also for the clerk and sanitary inspector on the ground floor. In the basement will be stores and a substantial strong-room. On the first floor will be a council-chamber and two committee-rooms. The building has been designed by Mr. A. R. Pannett, of Haywards Heath, and the contractor is Mr. Stephen Knight, of Cuckfield.

A.A. New Premises Fund.—The following are the latest additions to the Architectural Association New Premises Fund:—

	£	s.	d.
The Architectural Association	1,000	0	0
Basil Champneys	50	0	0
H. T. Hare	50	0	0
E. W. Mountford	50	0	0
Ernest George & Yeates	50	0	0
John Belcher, A.R.A.	25	0	0
Beresford Pite	20	0	0
E. Guy Dawber	12	12	0
R. S. Balfour	10	10	0
E. M. Gibbs	10	0	0
Francis Hooper	10	0	0
H. D. Searles-Wood	10	0	0
A. Paull	6	6	0
W. A. Forsyth	5	5	0
A. H. Hart	5	5	0
H. P. G. Maule	5	5	0

Donations previously announced	1,684	0	0
Total	£3,022	0	0

Vulcanite Roofing.—We understand that the name of the makers of this roofing, which is referred to on p. 288 of our issue for December 4th, has been changed to Vulcanite, Ltd., 2A, New Union Street, E.C.

Notice to R.I.B.A. Members.—Mr. Arthur Evans having, for reasons of health, been obliged to postpone his paper on "The Palace of Knossos in Crete," the general meeting of the R.I.B.A. fixed for Monday, December 16th, will not take place.

A Memorial to Prince Christian Victor, eldest son of the Prince and Princess Christian, is proposed to be erected at Windsor on a site near the foot of the Hundred Steps leading from the main thoroughfare through the town into the upper wards of Windsor Castle. The statue has been entrusted for execution to Mr. Onslow Ford, R.A., and will be placed in a canopied niche designed by Mr. A. J. Nutt, architect and clerk of works at Windsor Castle. The total cost will be £1,200.

Applied Art.—At a meeting of the Associate section of the Edinburgh Architectural Association held on December 4th (Mr. J. Stuart Syme in the chair), Mr. John Ednie read a paper on "The Applied Art of To-day and Yesterday," in the course of which he referred to the great changes effected through the agency of William Morris. The suburban villa came in for strong condemnation, and a suggestion was made that a committee of competent artists should be empowered to act as censors to prevent the amenity of beautiful districts being ruined by the wholesale multiplication of such monstrosities.

The Ancient Font of Great Staughton Church, Hunts, has been restored to use after being buried for some thirty-five years. It has been mounted on a new base and five short shafts designed by Mr. S. Inskip Ladds, A.R.I.B.A., of Huntingdon and London and the work was executed by Mr. Wade, of St. Neots. At the same time the fine bells (five in number) have been quarter-turned and rehung by Messrs. Warner & Sons of London. The east end of Wistow Church, in the same county, is being underpinned by Mr. A. Pettit, of Godmanchester, under the superintendence of the same architect.

New Barracks for Salisbury Plain.—The Government are about to provide additional barracks on Salisbury Plain to accommodate eight battalions of infantry, and the contract for the work, which it is expected will entail a cost of about £1,000,000, has been given to Mr. Henry Lovatt, builder, of Wolverhampton. The barracks are to be erected at the foot of Clarendon Hill, and will run from east to west and extend a distance of a mile and a half. The buildings will include thirty-two double company blocks for men's quarters, canteens, sergeants' mess, band rooms, drill sheds, guard houses, and officers' and commanding officers' quarters. It will also be necessary to build a village to accommodate the large number of men required to be employed on the works, and the location for it will be Brimstone Bottom, between Tedworth and Ludgershall, about a mile and a half away. Two railway lines have been constructed by the War Department to carry the material from Tedworth station to the site of the new barracks. It is expected that the work will be commenced almost immediately.

The Glasgow Technical College Architectural Craftsmen's Society held a meeting last Friday, when a paper was read by Mr. C. Ernest Monro, vice-president, entitled "Hotel-Planning and Construction." The question of site aspect and prospect was discussed, and, following this, the position on plan and general treating of the various public rooms, illustrated. Among these the coffee-room was important, and should possibly have bay windows, ceiling of good height, say 14ft., the floor of parquetry, and musicians' gallery provided, if desired. The lounge should be situated conveniently to coffee-room. The drawing-room also should be ready of access from coffee-room and have good outlook. The lecturer recommended the use of double sashes to these rooms, as also to the reading- and writing-apartments, to ensure the exclusion of outside sounds. The matter of prospect was also to be considered in the bedrooms, as good outlook is desirable to these. The various other rooms including kitchen, servery and offices, with the sanitary treatment necessary, were each in turn dealt with.

"Berliner Kunst" is the title of a new art monthly published by Ernst Wasmuth, of Markgrafenstrasse, 35, Berlin. It is chiefly devoted to furniture and decoration, and, like its predecessor, the "Berliner Architekturwelt," deals solely with the work of modern Berlin artists.

The "Clamond" Gas Radiator, in which the well-known Kern incandescent gaslight burner system is adopted, has recently been the subject of a careful investigation by the "Lancet." They state that the heating efficiency of this radiator is very great, "and we doubt whether such an output of radiant heat has ever before been attained at so little cost and so low an expenditure of gas . . . the combustion of coal gas is complete, and without the production of those partly-burnt gases or escaping unburnt gases which are injurious to health. . . . . The results of this enquiry distinctly confirm what is claimed for the 'Clamond' gas radiator—it gives a cheerful, healthy, radiant heat, is remarkably economical, and, as far as our experiments have gone, shows no deteriorating effect upon the air." The makers of the radiator are Messrs. The Kern Burner Co., Ltd., Kern Buildings, Gravel Lane, Southwark Street, S.E.

COMING EVENTS.

Wednesday, December 11.

Society of Arts.—Prof. Ernest Wilson, M.I.E.E., on "Aluminium," 8 p.m.

Northern Architectural Association.—Mr. J. Miller Carr on "Terra Cotta, &c.," 7.30 p.m.

Masters and Men.

Perth Plasterers' Wages Reduced.—The master-plasterers of Perth reduced the men's wages from 8½d. per hour to 8d. on November 30th. The building trade in Perth at present is, on the whole, very quiet, and consequently the reduction was received by the men without opposition.

A Strike of County Council Workmen has taken place at the Horton Manor Asylum buildings. Nearly 200 workmen are affected. The cause of the strike is due to the objection which the bricklayers have to work in conjunction with the tilers.

The Master-Builders in the West Bromwich and surrounding Black Country districts gave an intimation to their operatives some time ago that, owing to the depressed condition of the trade, they found it necessary to ask for relief in the shape of a reduction in wages, and it was suggested that the men should concede a reduction of ½d. per hour. It is reported that the operatives have determined to refuse this, but some of the leading employers assert that they have not as yet had any official intimation of the decision of the men. It is not likely that any further action will be taken on either side before March or April next.

Trade and Craft.

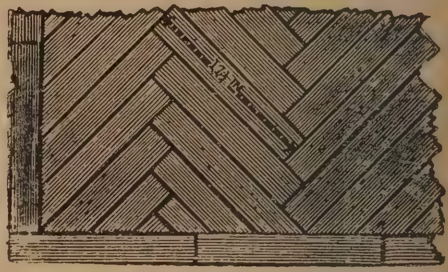
Ladders.

Ladders of all kinds are supplied by Messrs. Drew, Clark & Co., of 19, Waterloo Road, London, S.E. Extension ladders in two or three sections can be obtained from 8ft. 6in. to 36ft. long, while hinged or fixed double steps, tapering ladders, step ladders, braced back steps, builders' trestles, lattisteps, and folding trestle tables of various sizes are made by the firm.

Metallic Packing.

The Fairbanks Co., of 16, Great Eastern Street, London E.C., have placed on the market "The Merwarth Metallic Gasket," made in America. It is a metallic packing for steam and other pipes, and consists of a ring of lead wire enclosed by a piece of copper wire. When the flanges of the pipes are drawn together by screwing up the nuts, the lead is forced into every inequality and seals the joint, while the copper holds and preserves it. The joint will withstand the highest superheated steam-pressure, though it is certain that an electrolytic action would eventually be set up between the lead and the copper; the cost of renewal is, however, small.

FLOORING BLOCKS.



Per 100 Blocks out of sizes.	YELLOW		PITCH PINE

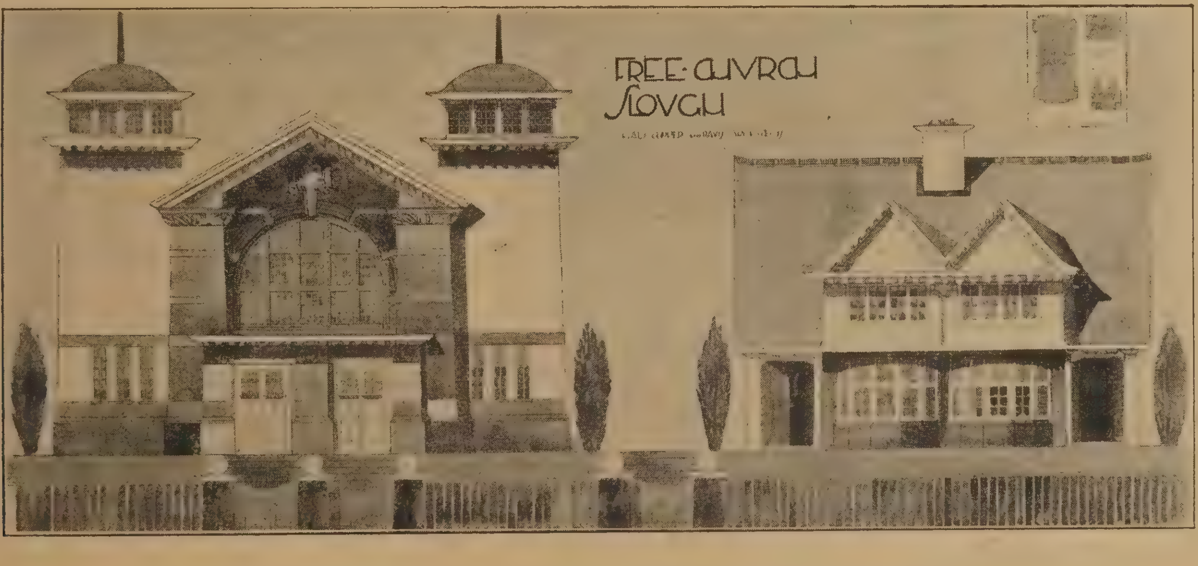
An Architectural Causerie.

O! The Public Taste. IT behoves everyone who produces a public commodity to examine the taste which creates the demand for it, or is influenced by it; and this more especially in regard to art and architecture. Our attention is re-drawn to this subject by the speech made by Mr. Augustine Birrell on Thursday last, when opening the exhibition of pictures by Scottish artists now on view at the Whitechapel Art Gallery. He pointed out that in the course of his career an artist (and, in a limited sense, an architect also) came to the time when he had to choose between painting in obedience to public taste or following the instincts of his own art. If he chose to paint to please the public, that was the moment when he was going to the devil. The public liked what was called a bad picture, because they were so horribly sentimental. The artist had only to put on the canvas some forlorn mother with tear-stained cheeks, bending over an empty cradle, and the public were done for. They wept, and, having wept, declared the picture to be a fine one, though the odds were it had no merit except the power to make them cry. Two hundred and fifty millions of people might prefer a coloured oleograph to one of Turner's landscapes, but they were wrong, quite wrong, even though their opinion were expressed by ballot.—Now these remarks by Mr. Birrell are eminently true of the public: and though one kind of art be deified by this critic and abused by that, though opinions on art differ more confusingly than in politics even (for there is never a cry, "What are politics?"), still, on certain grounds, all cultivated persons are agreed, just as, in architecture, the staunchest supporter of Gothic will admit the glory of the Parthenon and the most zealous advocate of Classic will revere the work of the Cathedral-builders; and all are surely agreed on the truth of Mr. Birrell's statements. Anyone with taste would condemn the prints for which the picture-dealer finds such a ready market, while the better work is bought by the few. It is, of course, in the more complex questions where art opinion divides. When Mr. Whistler affirms the maxim of "suggestion never depiction" he rouses many voices against him, just as when he asserts that a picture *is* a picture irrespective of what its morals (if any) may be. And it is here that the banalities of the public occur. In our own opinion, while we hold it quite possible to admire a picture simply for its colour or for its form, yet we cannot believe that an artist like Hogarth was prompted by no moral motives when executing his stupendous satires—we cannot think that they were nothing to him but a series of admirable drawings. The great thing in forming a judgment is to weigh both considerations; but the public do nothing of the sort—they see only the sentimental side, just as they will admire any building provided it is big enough and ornate enough. As for a hope of improvement, it is difficult to find one. But we certainly seem better off now than we were fifty years ago, and, maybe, the process of improvement is going on. It is the question of reform that sets one thinking, for the schemes (however admirable) of improving public taste which are discussed by the art and architectural societies are never heard of by the very persons for whom they are formulated, just as the ideas for improving the taste of the modern builder are either not known to him or pass unheeded. If you ask a builder why he covers his house with such tawdry ornament, he replies: "The public like it: it sells"—and as it is his living to build houses that will sell, it seems hardly fair to blame him; yet he should be blamed, because very often it is he that creates a bad taste among the public by erecting such commonplace houses, and not the public which is alleged to demand them. The public want cheap houses, not bad ones; and it is better to use good bricks and no ornament than bad bricks and bad ornament. But builders fail to see this.

Municipal Architecture. WE can always expect something strong (and probably sarcastic) from Mr. Reginald Blomfield, and he has maintained this reputation in the first of the two Warburton lectures which he delivered last week at Owens College, Manchester. He said that before about 1850 public buildings might have been unimaginative and dull, but the majority of them preserved some glimmerings of an architectural sense, whereas future generations would look with wonder and contempt on the mere barracks and masses of vulgarity that had too often done duty for our hospitals and our town halls. This caustic criticism sets forth generally Mr. Blomfield's views on the matter, but his particular contention was that, for good or ill, the municipal buildings of to-day represent the average public taste of the time, and it is not architects who are to blame, but the town and county councils who select them to do the work. Much as we are in accord with Mr. Blomfield's views, we can hardly accept this latter assertion, because we think that more often than not it is the inability of the architect which results in the unsatisfactory buildings in question. Money is spent freely on them both inside and out, but it is the design itself which is at fault. We are glad therefore to note that, in the latter portion of his lecture, Mr. Blomfield laid stress on the necessity for architects to receive a thorough technical training, and that before the student enters an office he should preferably have had some tuition at college or school. This, of course, is the system now established by the Architectural Association Day School, which, it is to be hoped, will be but the forerunner of many others throughout the country. London and Liverpool are the only cities in England where architectural education has been at all adequately recognised, but other towns also should provide such facilities—in the same way as technical institutions have been established, with inestimable benefit, throughout the length and breadth of the land. At Manchester it is intended to create a Chair of Architecture at Owens College when funds permit. We trust that this will soon be done; for it will be of a great help to the rising generation of architects in that district.



THE FREE CHURCH, SLOUGH. HALL, COOPER AND DAVIS, ARCHITECTS.

Free Church, Slough. THE materials used in this new church are brick, stone and rough-cast, the roofs being covered with green slates. Messrs. Hall, Cooper & Davis were the architects; and Mr. Joseph Seagrove, of Slough, was the contractor. The caps and shields are by Mr. A. Bernard Sykes, sculptor.

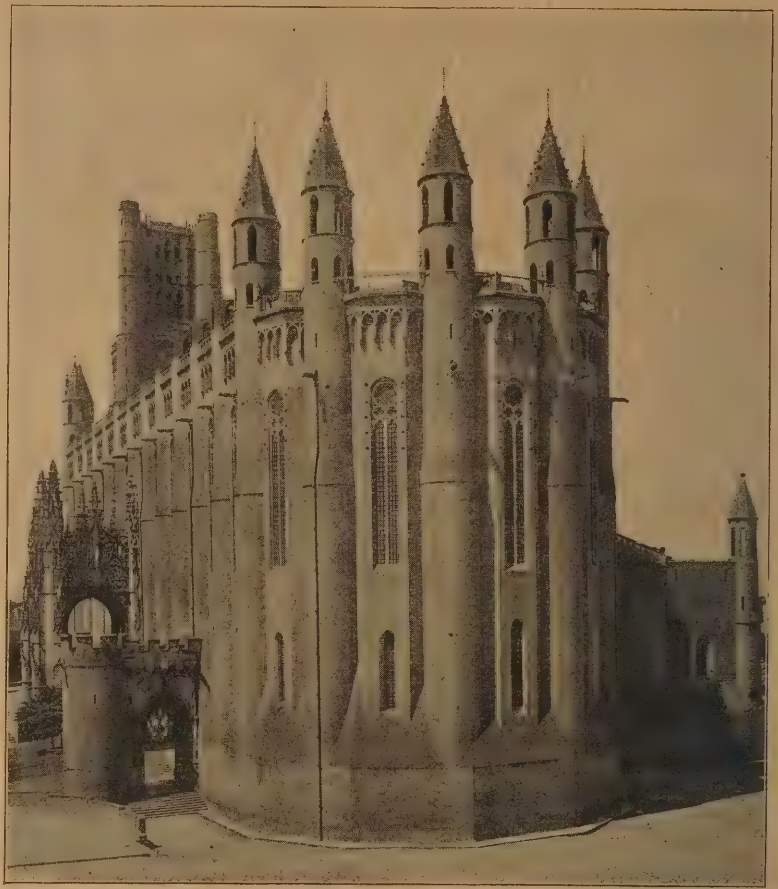
ALBI CATHEDRAL.

ALBI, the capital of the Tarn department in Southern France, though it is not fifty miles north of Toulouse, is not so often visited as it should be. The River Tarn flows quickly through it, and across the stream are several bridges, one being a structure which dates from the thirteenth and fourteenth centuries.

The cathedral was once a fortress and a church as well. It never could be mistaken for anything else. The church and the palace, with its adjoining buildings, form the southern and eastern sides of a large quadrangle. The north, with the fortifications, was towards the river. The west front of the cathedral, with its huge tower, partly occupied the other side. This tower is a mass of brickwork, like a great keep, rising in many stages with the angles formed by what might be considered four round donjons enveloping a high core which united them into one whole. From this group high walls of great thickness were built towards the river to meet those on the northern face.

The eastern end of the church rises as a great single apse, showing buttresses of an unusual circular form, between which are the small apsidal terminations to the five chapels within. These diminutive apses only exhibit on their exteriors the long windows which pierce them in two ranges. They rise out of the long sloping finish by which a deep base to the whole mass recedes into and receives upon itself the bays of the apses and the curved forms of the buttresses. The great apse rises with a vertical face to the top. The only "set-offs," which are very slight, are made in the buttress cylinders of brick.

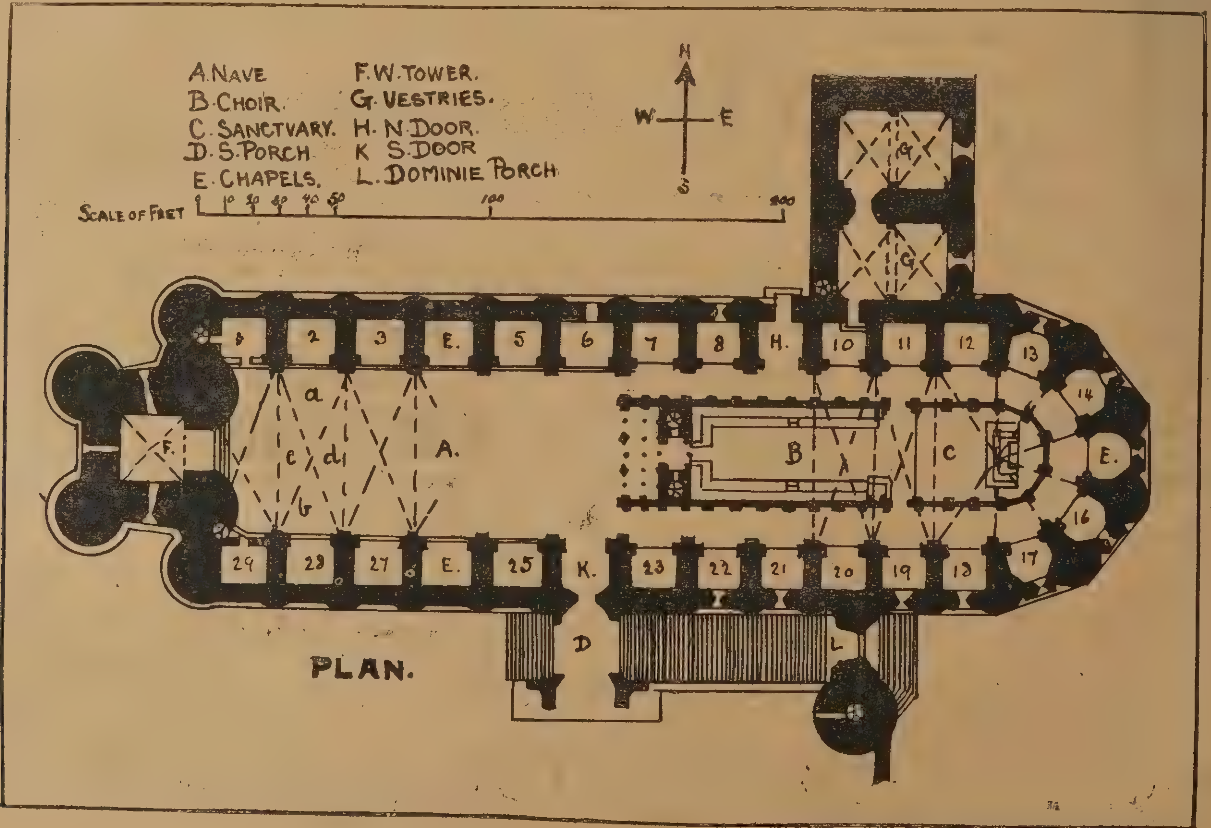
This strong mass is very impressive. The materials of which it is made help this effect, for the small bricks with the long white lines of the wide jointing, running like the silver threads of an extensive web laid on a red field, break up the broad plain surfaces. The little human figures at the base become a scale by which to measure its size, as, buying and selling, they move about in the market-place.



ALBI CATHEDRAL FROM THE SOUTH-EAST.

To the south of this end is a kind of porch which now serves to unite the last relic of the southern fortifications to the church. This remnant is a round brick tower, which was built in the thirteenth century. It was originally one of a chain defending the wall which enclosed the great cloister, and within which was a cemetery, a treasury, the houses of the canons, the chapter-house, and other buildings connected with the service of the church. These have all disappeared. The porch, named after Dominic of Florence, who was Bishop of Albi about the end of the fourteenth century, was strongly fortified, because by it was the only approach to the one entrance on the south side. There were two smaller doorways into the cathedral on the north, but, being protected by the palace and fortifications, they needed no such defence as this.

This tower, now forming part of the smaller southern gateway or porch near the east end, was once higher, but has been reduced to its present size by "restoration!" The veiling wall between it and the south side of the church had been much enriched by the prelate after

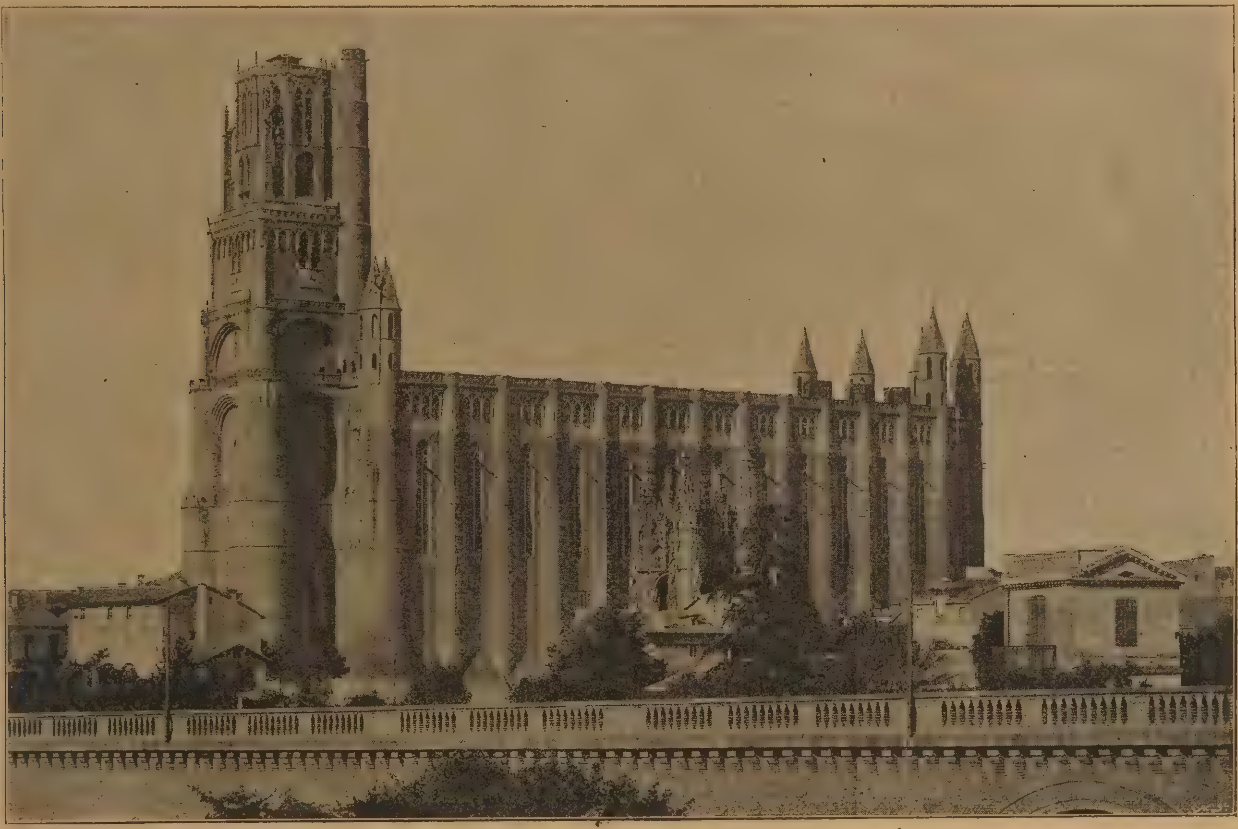


whom it was named. But nearly all the statues and reliefs were cut away by the vandals of the Revolution last-century. Now many of them have been restored or repaired, following the original idea and design devised from documents which remained.

Within this outwork fifty steps lead up to the great south portal, a Flamboyant structure standing on strong piers which support arches opening into it on three sides. The arch on the south was the one that used to lead into the cloisters; the western opened into a chapel, founded in 1521, now destroyed; and the northern formed the way into the nave.

The nave in this case really means the whole building. There had been a cathedral church in Albi in the ninth century. It remained until it was replaced by the present one, which was begun during the last quarter of the thirteenth century.

It has already been said that the church was part of a fortress. The great western tower, 256ft. high, was one of its most important points of defence. It was, no doubt, because of the uses this keep was to serve that there could be no entrance to the nave from the west.



ALBI CATHEDRAL FROM THE SOUTH.

The whole fabric is built of brick, with the exception only of the mullions and tracery of the windows, the porches, steps, some later portions of the west tower added during the fifteenth century, and the screen-work within the nave enclosing the choir and sanctuary, which was also a work of the same century. The foundations are a little more than 150ft. away from the river-level, and the walls as now "restored" rise 130ft. from the ground, but they were lower at an earlier date. These latter are 8ft. thick. The buttresses only appear on the exterior as slightly projecting curved portions of walling between the long windows, the sills of which are high out of reach from the ground. The real buttresses were, as the plan shows, inside the building, and between them were the chapels. These chapels stand 1ft. above the level of the nave floor, which is an uninterrupted span of 63ft. 6in. The whole width, adding the depth of the chapels, is 92ft. The internal length of this single vast nave is 300ft., and its height from the paving to the crown of the vault is 100ft.

The chapels are vaulted with diagonal ribs, and open into the nave by pointed arches. Above them, occupying the place of a clearstory and triforium combined, runs a gallery 14ft. wide, communicating completely round the interior except at the west. In this it was no doubt intended that the occupants of the fortification might still take refuge for further defence in case of necessity. They were well protected in such a position, as it could be reached only by very small and easily defended spiral staircases. The gallery is altered now in some details from its original condition.

The nave has twelve vaulted bays, counting from the west end, up to the transverse rib and buttress, where the apse begins its polygon of five sides, with an equivalent number of chapels. In the sixth bay from the west and on the south side is the principal entrance—a splendid feature under the great portal from without, and a truly glorious piece of design from inside the building. Westward, high up between the curved bases of the tower, is the great organ, with an interesting case. Beneath this, and painted upon the brickwork, are scenes of Life, and Death, and Judgment. Above all is the vaulting of the nave, with transverse and diagonal ribs dividing it into forty-seven compartments, with five more made by the vault of the apse. The whole vault is a most astounding work of colour-decoration. There is much to be found in Italy, much in France, in Germany, and in Belgium; but there is little painted decoration so impressive as this.

The twenty-nine chapels each still retain some of their original designs decorated in colour. Many have, unfortunately, been defaced. Further, there is that marvel of design and craftsmanship, the choir and sanctuary screen, and the rood loft, with their accompaniments. There is some fine glass of the fifteenth century still to be seen in a few fragments distributed among the windows.

The large painting on the barrel piers of the tower is the oldest, and one of the best, in the church. It is 50ft. high, and if the whole were still there it would represent one of the largest pictures to be seen. Though executed during the first decade of the fifteenth century, it is in a far better state of preservation than Michael Angelo's "Last Judgment" in the Sistine Chapel, where no pains have been spared to prevent decay. It was apparently painted directly upon the brickwork with so little preparation to receive it that the lines of the brick-jointing all show upon its surface. This does not in any way impair the effect of the whole, but rather improves it by giving a play to the surface.

The choir-screen was commenced about 1485–90, and has been described as the richest example of the kind in existence. The plan will show that it begins just eastward of the bay in which is the south door. There are three arches leading from the nave—one into the choir and the others to the side passages or ambulatories north and south. From these aisles are two other entrances to the central space between the sanctuary and choir. The northern of these still retains its old wooden door, which, like those opening into the nave, is a fine piece of design and craftsmanship. The south doorway was barricaded with boarding (as some "restoration" was still going on) in 1896, and the door itself had been removed.

Passing into the choir, there are, north and south, two doors giving access to the circular staircases leading to the gallery above. The space between them is vaulted, and in every direction is carving and tracery of the most lovely kind. Standing here under the arch, and facing east, the whole place is revealed.

The woodwork of the stalls is very plain in comparison with the masonry. The contrast is most valuable.

The altar now in the sanctuary is not the original one, and the paving, only lately finished, is also entirely new both in the choir and the sanctuary. The next things to notice are the sculptures of the Apostles and Prophets, which are still preserved upon the screen inside the choir and also outside in the ambulatory. These figures (which are 4ft. 6in. high) are all painted, but the colouring on the flesh parts is not realistic, and there is little, if any, attempt to imitate Nature.

There remains now the great vault of the nave, with its decoration. And it is upon this that the glory of the cathedral largely depends. But even this, if it did not cover so grand a field, could not be so impressive as it is. As a work of construction it is quite simple. The plain surfaces of the interior were of brick plastered to receive the colour. The ribs which support this

ALBI CATHEDRAL: THE DOMINIE GATE.

filling of the vault are stone, moulded very little. Transverse ribs divide the whole into twelve bays, and these are subdivided by diagonals into forty-seven compartments. Excepting ten compartments above the windows in the first, second, third, fifth and sixth bays, it has painted on it, besides the ground colour and the designs traced upon that, figurework of some kind with much variety of treatment.

The great vault is painted a blue almost as lovely in hue as the heavens. It is covered all over this ground, except where the figure groups occur, with designs in white, toned with grey. The ribs are now dull yellow; they once were brilliant lines of gold, between which are placed the pictured groups. The work, excepting the five compartments of the apse, has never been "restored." It is now as it was left by the Italian decorators who executed it between the years 1502 and 1512. The blue has lost none of its depth and purity, and all the colours are apparently as fresh now and as brilliant as they were 450 years ago. After some enquiry it was found that the blue used for colouring the vault had been obtained from carbonate of copper, or, in the language of chemical analysis, "from the precipitation of salts of copper by carbonate of potassium."

ARCHITECTURAL ASSOCIATION.

A MEETING of the Architectural Association was held on Friday evening at 9, Conduit Street, W., the chair being occupied by Mr. R. S. Balfour. After the minutes of the last meeting had been read and confirmed, Mr. Edward Cooper (Camden Square, N.W.) was elected a member of the Association.

Some "Notes on Oxford," by Mr. J. E. Forbes (A.A. Travelling Student, 1901), were then read by Mr. J. D. Tate, as Mr. Forbes himself was unable to be present. The author observed that so much had been written and said about the architecture of Oxford that it would be quite unnecessary for him to repeat facts which were so well known, and he therefore proposed to deal with his subject historically. The paper was illustrated by about fifty lantern slides.

A vote of thanks was proposed by Mr. N. F. Barwell, and seconded by Mr. W. J. H. Leverton. Mr. Balfour remarked that he was not quite in sympathy with the lines adopted by Mr. Forbes, who had been asked to give in this paper an account of his studentship. With regard to the remark that nothing new could be said about Oxford, he thought Mr. Forbes thus confessed himself unobservant, or so excessively modest as to deem that what he might say about the architecture would not be interesting to others. Yet he (Mr. Balfour) always thought that what one student could tell another was of great interest. He was therefore disappointed with the method adopted by Mr. Forbes.

In the course of the evening the chairman announced some additional donations to the New Premises Fund, as follows:—

	£	s.	d.
J. Alfred Gotch	31	10	0

A New Stained-Glass Window at Chipping Norton Parish Church is to be erected from a design by Mr. E. C. Kempe, of Nottingham Place, London, in substitution of the westernmost window in the south wall of the chancel.

MR. REGINALD BLOMFIELD ON MUNICIPAL ARCHITECTURE.

THE first of two lectures under the Warburton Trust was delivered on Wednesday last at Owens College, Manchester, by Mr. Reginald Blomfield, whose subject was "Municipal Bodies and Architecture." Mr. Alfred Hopkinson, principal of the College, presided.

Mr. Blomfield said he did not propose to offer any suggestions as to the practical business details with which municipal bodies were concerned in relation to architecture; a far more widely reaching question was the mental attitude of municipal bodies towards architecture, the faculty of judgment which they possessed—or did not possess—as representing the average public. He hoped to show that there was here a growing necessity for wider and more intelligent education, and to offer some suggestions as to the lines that this education should follow.

Municipal Buildings.

Municipal bodies in modern cities had more important functions to discharge in dealing with architecture than anybody else. The buildings for which they were responsible were public buildings, and therefore were, or should be, monumental in character, with regard to the fact that they were built once and for all, for certain special and permanent uses. For good or bad, they represented the average public taste and intelligence of the time. It was a reflection that should make the more thoughtful of our public men ponder on their misdoings—with some misgiving that future generations would look with wonder and contempt on the mere barracks and masses of vulgarity that had too often done duty for our hospitals and our town halls.

Unkind things were said about modern architecture, all tending to the conclusion that there was no such thing and that architects had nothing to say. This might or might not be the case, but it was not the fault of the architects. It was the fault of the bodies who employed them—bodies who too often took a very easy view of their responsibilities, and, considering architecture a matter of slight importance, cheerfully treated the selection of their architect as a matter of merely local and ephemeral interest.

The Attitude of the General Public.

The attitude of town and country councils to architecture but too faithfully reflected the attitude of the general public towards the art. That this attitude was quite unsatisfactory there could be no doubt. He thought that any competent observer who took note of the average of architecture in our great cities would be driven to the conclusion that the general level of taste and ability was low. He would find that some of the least admirable of these buildings were the most admired. He would find, too, no common standard of appreciation, but merely a mass of unrelated judgments, amounting to little more than individual expressions of like or dislike. He would, in short, find public opinion in architecture in a state very little removed from chaos. He would find that there was no intelligent body of opinion to which a competent architect could appeal as a matter of course; and that the public in the pursuit of architecture were like sheep without a shepherd. The uncertainty of taste shown in the treatment of the public buildings of the last fifty years was conclusive evidence of the confusion of judgment which existed in the minds of our representative public men. There was no reason in the nature of things why this state of chaos should indefinitely continue.

It had not always been so in English architecture. In the seventeenth and, still more, in the eighteenth century, when a building was to be erected such questions as had recently exercised the Liverpool Cathedral Committee did not exist. Architects who were called upon to design a building knew exactly what they had to do. They had no necessity to clear the ground by a long preliminary discussion as to the style to be adopted. But about 150 years ago a new element appeared. The amateur and the virtuoso assumed an importance which they had never previously enjoyed. Distinguished noblemen dabbled in design, and eminent men of letters amused themselves with architecture.

From Walpole to Ruskin.

Mr. Blomfield quoted the example of Horace Walpole, who, he said, subordinated architecture to the elegant insincerity of his own taste. When a direct attempt was being made to reproduce Gothic architecture, in obedience to a purely literary sentiment, it was hardly to be wondered at, he thought, that the layman should have lost his bearings.

Thus the nineteenth century opened with three styles struggling for ascendancy—the old traditional classic of Chambers and his school; the new Greek method, which was to be carried to such a high degree of excellence by Decimus Burton, and later by Thompson, of Glasgow; and, lastly, this revived Gothic. All architects of reputation followed one or the other of the first two manners. The amateurs stuck to the Gothic—and the amateurs carried the day; but when one considered that the whole force of the Romantic movement was behind them, the result was not surprising.

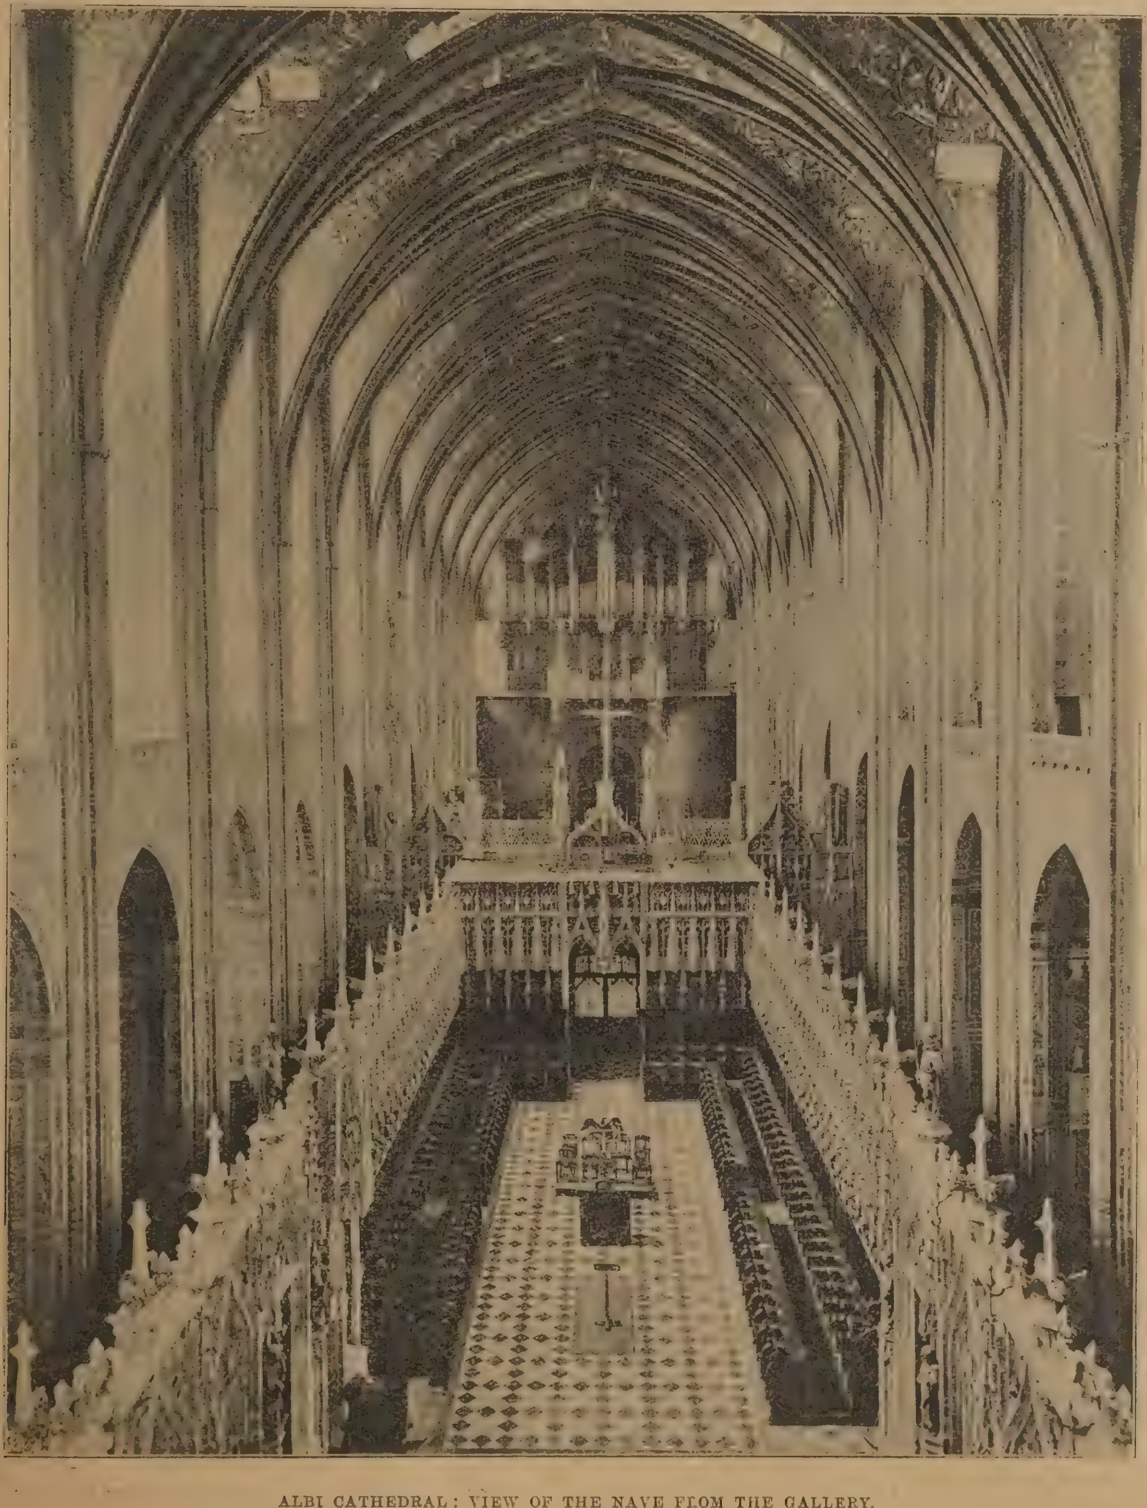
So Wyatt, or Wyattville, started his career of architectural murder; Pugin followed, and threw himself into the cause with the enthusiasm of an ill-regulated mind; and then came Ruskin, a man of narrow prejudice but brilliant genius, whose eloquence won a sort of St. Martin's summer for the Gothic movement, prolonging its life quite two generations behind the appointed time.

All these men, from Walpole to Ruskin, seemed to have laboured under one very serious vice in their handling of architecture. It never occurred to them that architecture was an art which dealt with practical and immediate necessities, that it was founded on use and based on construction, and that the details which so much exercised their attention—Walpole with his ridiculous Gothic, Ruskin with his exquisite sense of detail, and no more—were not architecture at all, but mere words or phrases in its language. So Walpole treated architecture as a subordinate expression of literature. Pugin, and still more Ruskin, translated it into terms of ethics. The result had been that the sense of architecture as an art, with its own limits, its own technique, and its own ideals, had almost disappeared, even among architects.

So far as the public was concerned, laymen had first of all lost their bearings in architecture, and finally had lost their interest in it, as being an art of no serious bearing on the immediate concerns of life, and therefore to be dealt with according to the fashion of the time, without regard either to first principles or to the teaching of the past. This habit of mind had been faithfully reflected in the conduct of the various bodies that represented the public.

The Effect of Public Competitions.

The history of public competitions for town halls and similar buildings erected in this country during the last fifty years was too painful to go into. But, with rare and brilliant exceptions, the deplorable results were to be seen in every part of England to this day—in asylums



ALBI CATHEDRAL: VIEW OF THE NAVE FROM THE GALLERY.

that disfigured a whole countryside with their deformities and town halls that brought their cities to shame. As for public parks and gardens, in these we had reached the lowest note of vulgarity ever sounded in our country. These fiascos in municipal architecture were a matter of the last fifty years or thereabouts. Before about 1850 public buildings might have been unimaginative and dull, but the majority of them preserved some glimmering of an architectural sense; they regarded proportion, and were not devoid of a certain staid dignity.

But this sort of thing would never do for the histrionics of the modern revivalist. He must have "something that knocks you down then and there"—something to be talked about, something that would reproduce well in the art papers. The absurd thing about it was that meanwhile there existed a high degree of individual good taste and culture. The difficulty was to get this knowledge into line and to make its weight felt in municipal dealings with architecture. We needed to instil sounder and simpler views into the man in the street, to make him more anxious and inquisitive about the buildings he had to live with, and to suggest to him larger ideas as to his duty in the matter. It was pretty certain that if the public wanted good architecture, and really cared about it to such an extent as to make it a matter of serious interest, they would very soon get it. He thought that there was no lack of ability among the architects of this country; the only thing was that ability did not appear to be wanted. If it were, public bodies would hardly tolerate what they got in some of their public buildings. London, for instance, or the London County Council, would hardly permit magnificent frontages in new streets to be taken up by financial syndicates and covered by piles of hideous buildings which made one long for a second Nero. Important public buildings would not be handed over to mere office draughtsman of unproved capacity; the care of our cathedrals and great public monuments would not again and again become what was more or less of a public scandal.

Education.

How were they to get at this state of indifferentism and to rouse municipalities and public bodies to a sense of their responsibilities? The question became one of education, and it was a question which, in a great and intelligent city like Manchester, should be seriously considered by its representative public men. Cities such as Manchester were not hampered by the traditions of the older universities; here, with a new foundation specifically designed to meet modern requirements, there could be no excuse for neglecting to provide for this growing educational need. There seemed to him, broadly speaking, to be three channels through which the public could be reached—(1) by direct school teaching; (2) by treatises on architecture; (3) by the work of architects themselves.

With regard to this last point, it must be obvious that in an art such as architecture, which must make its appeal through the eye, the object-lesson of a beautiful building was worth all the treatises in the world. But then, in the first place, the architect must be given the opportunity to design such buildings, and the public must have an eye to see them with when they were built.

Hitherto, and until quite recently, no systematic public education in architecture had been attempted in this country. It had remained outside the lines of general education, and from this point of view had been considered rather as a mere hobby for which no special provision need be made in educational schemes. It was for the modern universities to remedy this defect and to organise a system by which, at the great provincial centres, not only technical instruction for the student, but some reasonable education in the nature and history of architecture, should be provided for the public.

A More Exact Technical Training Wanted.

There was not only room but a growing necessity for more exact technical training in architecture. The old-fashioned system of articles, though not to be dispensed with, was not entirely satisfactory. His own opinion was that anyone who intended to become an architect should be put through a course of technical training as thorough as possible before he entered an architect's office at all. The means of such training should be provided at the great modern universities, and should include not only lectures but practical training in workshops and laboratories. Moreover, this training should not be confined to architectural students only. It was a well-known fact that the great majority of buildings erected in this country were not designed by architects at all; and it was also a fact that many contractors depended upon clerks and foremen for their practical knowledge. We should hear a good deal less of buildings tumbling down before they were up, of drains laid the wrong way, and the like, if all builders had to go through a course of good practical training. Moreover, the speculative builder might avoid some of his worst iniquities of taste if he had any—even the most rudimentary—acquaintance with what had actually been done in architecture.

After the technical training was completed, the work of course must become more or less educational: it was evident that some highly-trained controlling mind would be necessary to undertake this education in the art of architecture. Such a teacher would indeed have his work cut out for him, for it would be his business to clear the air of misconceptions and to lead not only students but the wider circle of an intelligent public to a sounder appreciation of the theory and function of architecture.

At this moment the public—that was to say, the average man—did not appreciate or understand architecture. In the first place, there was that old stumbling-block and rock of offence, the question of styles. It was evident from a recent controversy in regard to a great building enterprise that to the lay mind architecture presented itself as a question not of style but of a style. That was to say, he must be able to label it definitely Gothic or Classic or Greek or Egyptian or whatever else it might be. This meant that a design should present such a number of familiar features that it would be at once pigeon-holed as Gothic or Classic, because even the layman could see that it reproduced the mouldings and traceries, or the orders and entablatures, which he had learned from his text-book to be the distinctive features of the style in question. So the layman went his way quite satisfied. He thought that he had got his style according to his prescription, and fancied that he was building as good a Gothic cathedral or Classical temple as ever built in the days of Edward I. or Pericles.

Archæological Pedantry.

But he was not; he was only getting a more or less knowledgeable copy; he was getting not architecture but archæological pedantry; and the better it was the worse it was, because so far it divorced architecture more effectually than ever from the actual uses and necessities of the world we live in.

Such a professor as he had suggested would make it clear that these styles were merely the classifications of historians, often of amateurs; that they were merely labels of identification dealing with exteriors only, and that behind them there was an elusive spirit to be caught, the real meaning of architecture. It would be a great thing once and for all to clear away this initial misconception of architecture, but there were others hardly less formidable. The way out of the present welter was not easy. A century or more of experiment in the arts had brought little but disappointment and disillusion. Perhaps it was in this latter result that the hope for the future lay. Signs were not wanting of a half-articulate revolt against the two extremes of architectural disease, scholasticism on the one hand and commercialism on the other. We must learn to look upon architecture as a living art, not "complete and exhausted," as a distinguished critic made bold to say the other day, but with possibilities of development waiting to be found not less varied than in the happy days when architecture was a vital force.

A Chair of Architecture at Owens College.

Mr. Blomfield was thanked for his address on the motion of Mr. Alfred Darbyshire (president of the Manchester Society of Architects), seconded by Professor Tout. Professor Tout said that they hoped to found a chair of architecture at Owens College in the near future. It might be asked why there was not already such a chair in existence, but the reason was that the funds of the college were not adequate at the present moment for this new venture. If they could only get a little money to start with they would do their best to found the chair and to get the right man to fill it.

Mr. Blomfield, in responding to the vote of thanks, said the establishment of a school of architecture at Owens College would meet a very great need, and he wished Manchester all success in the enterprise.

Mr. Charles Rowley, chairman of the Manchester Municipal School of Art, says: "We have had conferences with the Owens College authorities and with the Manchester Society of Architects, and the Lord Mayor even went so far as to say that he would recommend the Corporation to aid by money grant the salary of a professor of architecture at Owens College. All this seems to have been ignored. We are taking the higher architectural teaching in quite as complete a form as we find it in Liverpool or in any of the Metropolitan and foreign architectural schools whose establishments and curriculum we have studied."

LONDON COUNTY COUNCIL.

AT last week's meeting of the Council Mr. Beechcroft asked the chairman of the Finance Committee whether he could afford any information with reference to the strike which took place at Horton Asylum, Epsom, about a month ago, in consequence of which a number of workmen were at present out of employment; and whether he could hold out any prospect of the dispute's being settled. Lord Welby said it was a fact that there had been a dispute at Epsom, resulting from a disagreement between the bricklayers and tilers. The Works Sub-committee had that day received a deputation from the trade-union on the subject. The whole question had been discussed, and the members of the deputation had promised to communicate with the Committee. He hoped that communication would be received in a day or two, but until it was received he could not give any idea of what the result of the conversation would be.—In regard to the view from Richmond Hill, Lord Monkswell said that an arrangement had been made with the owner of the Marble Hill Estate to extend the option of purchase for another six months, which would give them to the end of next June, simply on the terms of their continuing to pay interest at the rate of 4 per cent. up to the time the purchase was completed. There was, therefore, no need to feel apprehension as to their being driven in a corner at the end of the year.—It was agreed to adopt the underground system of electrical traction on further sections of the Council's lines south of the Thames.—After discussion it was decided to proceed with the Hampstead Road improvement, provided the St. Pancras Borough Council consented to the construction of tramway lines along Tottenham Court Road.—The Bill for the construction of a shallow underground tramway from the Victoria Embankment to Theobald's Road was approved.—It was agreed to contribute two-thirds of the cost of widening King's Road, Chelsea. Half the nett cost was ordered to be paid for the widening of a part of Brompton Road.—The Council approved the Water Purchase Bill.—Mr. R. Williams enquired whether the Corporate Property Committee had yet considered the application of an American syndicate to lease for building purposes a large portion of the proposed crescent site in the Strand. Mr. Hubbard (chairman of the Committee) said that the question had been referred to the valuer and the solicitor.—Replying to Mr. Verney, Colonel Rotton said he would have been delighted to have given any information with regard to a new county hall. So far as he could see, they would not get one during the lives of a good many of them; as they had not yet got a site.—The Finance Committee reported that the Westminster City Council applied for a loan of £24,000 for the alterations of the Town Hall, Charing Cross. Loans for three years, to be repaid by the sale of the disused Vestry Halls or other recoupments, were granted.

ORIENTAL EXPLORATION.

The Discoveries at Susa and other Buried Cities.

AS the season for the resumption of the work of exploration in the East is now drawing near, it may be worth while to notice some of the most important results of the work of the last two years. Foremost them among we have the work of M. de Morgan at Susa. The explorations conducted upon that site have restored not only a new chapter of history, but also revealed a prehistoric civilisation of no mean order. Of the two great tumuli of Susa, the larger was explored by Dieulafoy and found to contain the palaces of Darius and Artaxerxes, and the chief objects discovered now decorate the Susanian Rooms of the Louvre. M. de Morgan, however, worked in the smaller tumulus, and found the remains of two cities, the later of which was the Elamite capital destroyed in B.C. 640 by the Assyrians, and the second and lower town, of very primitive construction, resembling the oldest remains yet found in Babylonia, such as those in the lowest strata at Nippur, which may be assigned to a period not later than about B.C. 4500. The quantity of cinders and ashes indicated that the town had been destroyed by fire. Below this were no fewer than four successive settlements, so that we must assign an enormous antiquity to the oldest of these, which was found at a depth of 75ft. beneath the surface of the mound. The site was first a camp occupied only during the harvest. Then there grew up a small village or town, with wooden huts similar to those at Lacish, which was destroyed by fire. Then a more permanent town with walls, and a kind of fortress palace. Lastly came the Anzanian capital, destroyed in B.C. 640.

M. de Morgan has shown that the plain of the Dizful and Karun, as far as Mal-Amir, with its ancient caves and sculptures, is covered with mounds marking the sites of ancient cities and offering a fruitful field to coming explorations. The American work at Nippur has been continued by Dr. Hilprecht, and a new expedition under American auspices has commenced work at Nuwais, or Aboo Sharein, the site of the ancient Chaldean Sacred City of Eridu. The Germans are working in the mound of El-Kazar, "the palace," an immense hill of brickwork, which has been found to be the Palace in Nebuchadnezzar, in which Alexander the Great died. Lastly, the British Museum has despatched Mr. L. W. King to Babylon, and at length we are to see a British Expedition in the field.

ALBI CATHEDRAL : THE ORGAN.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Cement Tank.

Kingsbridge.—Querist writes: "I have a water tank to construct in the ground. I propose to make the floor of concrete 9in. thick; the roof of 5 by 3 steel joists 2ft. apart filled in with concrete, and the external walls of either 14in. brick in cement or 12in. concrete. The inside will be rendered with cement. All concrete to be composed of 4 broken stone, 2 of sand to 1 of Portland cement. Do you consider this satisfactory?"

The design is satisfactory. Concrete walls will be quite efficient if rendered inside with cement, but the surface must be finished with the trowel. The joints of the brickwork (if used) would need to be raked out to provide a sufficient key for the cement rendering.

Books on Perspective and Hydraulics.

Edinburgh.—Perspective writes: "Kindly name a book dealing with perspectives, and also one on hydraulic rams, &c."

R. Phené Spiers's "Architectural Drawing" (Cassell & Co., Ltd., price 10s. 6d.) and R. G. Blaine's "Hydraulic Machinery" (E. & F. N. Spon, Ltd., 14s.), or H. Robinson's "Hydraulic Power and Hydraulic Machinery" (Charles Griffin & Co., 34s.), will doubtless serve your purpose. There is also Mr. J. Wright Clarke's book on "Hydraulic Rams: Their Principles and Construction" (Batsford, price 2s.).

Book on Capitals.

London, W.—J. B. B. writes: "Kindly mention a good work on capitals."

We know of no book dealing exclusively with capitals.

Manholes and Sewers.

London, E.C.—X. writes: "What is the usual size and shape of a manhole to a 15in. sewer, 15ft. below the road, entered from the corner of the road? Can you refer me to a book that would assist me in specifying for a modern sewer about a quarter of a mile long?"

Manholes are usually about 2ft. square. "Sewerage and Sewage-Disposal," by Henry Robinson (E. & F. N. Spon, 12s. 6d.), or "Sanitary Engineering," by Francis Wood (Charles Griffin & Co.), will furnish you with the desired information.

Payment for Openings in Masonry.

Openings in Building writes: "I am erecting a new fan engine-house (rubble masonry) for a colliery company, the company finding materials. The tender and written contract both state "All openings under 8ft. to be measured in." Besides door and window openings, there are openings 2ft. and 5ft. wide for the fan, fly-wheel of engine, and other parts of machinery, to work in; also for the purpose of going down to the handholes to screw up the holding-down bolts. I had to give one price per cub. yd. for the whole of the masonry, and was told by the engineer that the work would be measured solid; and I based my price and put in the above words in my tender accordingly. Now a new engineer has been appointed, who refuses to measure and pay for the openings except those for doors and windows. (1) Am I entitled to have the other openings paid for or not? (2) Am I justified in stopping the work until the company pay for the openings? (3) Can I recover damages in consequence of the openings not having been paid for weekly?"

(1) Yes, certainly. (2) Yes. (3) You might be able to, but we should not advise you to fight an action at law for this. Your best method of procedure is to get your local solicitor to communicate with the company, demanding payment; the expense will be small, and the action probably effective.

Canvas for Temporary Buildings.

York.—Ebor writes: "Kindly name the chief firms who deal in canvas suitable for covering in the sides and roofs of temporary buildings for an exhibition."

The New Wire Wove Roofing Co., 75a, Queen Victoria Street, E.C.; London Patent Felt Co., 110, Cannon Street, E.C.; Willesden Paper and Canvas Works, Ltd., Willesden Junction, N.W.; Robert W. Blackwell & Co., Ltd. (makers of P. and B. Ruberoid Roofing), 59, City Road, London, E.C.

Liability for Builder's Mistake.

Bristol writes "To what extent is an architect liable for a builder's mistake? For example, a builder is under contract to build rooms of a certain height, figured on the sections, but he does not go high enough by one course of bricks. This is not found out by either builder or architect until the building is nearly completed. Can the builder be called upon to rectify the defect; and what position would builder and architect be in if the proprietor took over and occupied the building without having any change made?"

Builders often do this trick to save expense, but you are entitled to make the contractor remedy the defect, whatever work may be entailed, if you chose to insist upon it; but as the deviation from the plans is not very material you should get your client's consent to the alteration and make the builder recompense you both for the saving he has effected and for the damage to the design. If he refuses to recompense you, order him to alter the building according to the original plans.

Party Walls and the Rights of Adjoining Owners.

Croydon.—E. B. writes: "A client of mine has taken a new shop on a twenty-one years' lease. It appears that the adjoining owner on one side arranged to pay the cost of erecting the external wall of my client's shop and constituting it a party wall. He is now building on his site and has taken away the truss and pediment placed on the pilaster on the front of the wall, and he proposes to occupy this place with a portion of an arch which is out of keeping with my client's building. He also proposes to build his string-course partly in front of the glass fascia erected by my client. Consequently the total projection would be about 9in. from the centre of the party wall. Is he entitled to do this?"

I gather from your letter that the pilaster, truss and pediment, part of which has been removed, is jointly owned by your client and by the owner of the adjoining premises, who you state contributed towards the cost of its erection. You do not say whether or not any agreement was entered into between the parties at the time, and whether the adjoining owner agreed with your client not to remove or alter the party structure. I presume no such agreement was made. Such being the case, it is clear that (if the parties contributed in equal shares) the adjoining owner has a right to remove his portion of the structure when he pleases, so long as he does not injure the part belonging to your client. Also, in the absence of a special agreement to the contrary, the adjoining owner can erect any kind of building he likes on his plot, be it ever so much out of harmony with the design of your client's house; neither has your client any remedy against the owner of the freehold (from whom I presume he holds), save in the event of the freeholder having covenanted with him as to the class or design of buildings to be erected on the adjoining plot. In other words, your client has no remedy against either the freeholder or the adjoining owner, save in the event of a breach of an agreement by them. If the adjoining owner confines himself to removing or altering *his own* part of the structure, I am of opinion that he is entirely within his rights. From the plan which you send (not reproduced) it appears he has *not* so limited his operations. He has removed (apparently permanently) portion of the party structure, *i.e.*, the truss and pediment, and has erected or is about to erect in lieu thereof an arch, part of which will project laterally about 9in. from the centre of the party structure on to your client's premises, and the string-course will obscure portion of a glass fascia erected by the latter. In doing so he is undoubtedly committing a trespass and can be restrained by injunction. Damages can moreover be obtained against him. Notice should forthwith be served on him cautioning him against proceeding with the work under pain of legal proceedings. W. J-R.

Concrete Floors.

York.—E. M. writes: "If I make a concrete floor 10ft. sq., and embed in the concrete (below the neutral axis) tie rods of iron, equally distributed, very securely fixed at each end, but only going in one direction and not crossing each other, and the safe total tensile strain of the rods without elongation is 10 tons, would the safe distributed load the floor would carry be equal thereto, *i.e.*, 10 tons?"

The rods contribute to the strength in the direction of length in which they are placed, but give no transverse strength, which will depend on the thickness of the concrete. If, however, it is made about 7in. thick a 10ft. by 10ft. floor will bear a distributed load of more than 10 tons.

Churches in Kent and Surrey.

London, S.E.—Scotsman writes: "Kindly name some old buildings in Kent or Surrey, within easy cycling distance of East Dulwich, suitable to measure for the R.I.B.A. Intermediate Testimonies of Study."

Warlingham Church, Surrey (see an article on p. 163 of our issue for October 3rd, 1900), Eltham Palace, St. Mary Cray and Orpington Churches, Kent.

Preservative Solution against Dry Rot.

F. D. writes: "Some flooring and joists having been taken up because of dry rot, what is the best solution for covering the surrounding timber, which may possibly contain germs?"

Burnett's solution.

Claim for Defective House.

Berks.—House Owner writes: "Have I any redress on finding in a new house (within a few months' occupation) the joinery parting, doors painted white and enamelled over showing broad yellow streaks across them, rain driving through walls (hollow) under window-sill, roof leaking, drains untested? Is it obligatory to have a trap for a valve closet, and if one is not put in, is the builder or architect liable?"

If you have bought the house from a builder after examination, *i.e.*, in "market overt," you have no redress. If you have a guarantee, you can claim compensation. If an architect has been engaged to supervise, you can claim damages for his incompetence or failure to display reasonable skill and care, or fraud, but this would be difficult to prove, and we do not advise you to go to law. As to your other questions, there is no legal time that you can claim compensation in, unless there was a clause in the contract stipulating that the builder should keep the house in repair for so many years. Valve closets are insanitary, and are now seldom used; they need a trap; but we doubt if you have such a closet in the house. The necessary trap to every closet is usually attached, and can be easily got at, but traps are also required in the drain beneath; your enquiry is too indefinite to give a complete answer.

Liverpool Cathedral: A Petition Committee.—A committee has been formed to oppose the Bill which is proposed to be introduced in the next session of Parliament for the purchase of the St. James's Mount site. A firm of solicitors has been retained to advise them, and an arrangement has been made with the London City and Midland Bank to receive subscriptions at their head office in London or at any of their branches. Cheques should be made out to the credit of the treasurer, and paid into the credit of his account in Liverpool, and endorsed "Liverpool Cathedral Petition Account." For further particulars application should be made to the Secretary, Liverpool Cathedral Petition Committee, 6, Dale Street, Liverpool.

Bricks and Mortar.

APHORISM FOR THE WEEK.

Architecture and Construction must be taught or practised simultaneously; Construction is the means, Architecture the result. Nevertheless, there are works of architecture which cannot be considered as construction, and certain constructions which can scarcely be ranked among architectural works. Some animals construct: these cells, those nests, others mounds, burrows, hovels, wicker-work—e.g., *woven twigs. This is certainly construction, but it is not architecture.*

VIOLLET-LE-DUC.

Our Plates. THE new technical schools being built by the Corporation of Barrow-in-Furness as a memorial of the late Queen Victoria's Diamond Jubilee are being pushed rapidly forward for early completion. The front of the building is faced with terra-cotta, after the designs of the architects, Messrs. Woodhouse & Willoughby, of Manchester, and the figure panels have been designed and modelled by the Burmantofts Works, Leeds, from particulars given by the architects. The central figure of the panel represents "Peace." The figure on the extreme left of the panel represents "Engraving." Another figure represents "Ceramics." "Painting" is next. On the extreme right is the figure representing "Sculpture." "Architecture," who is holding a small architectural model, is interested in the sculptor's work. The art of "Metal Work" is supported next to the central figure, with "Progress" and "Electricity," who is represented by "Shipbuilding" and "Mechanical Engineering." The figure on the extreme right represents "Mathematics." "Chemistry" and "Astronomy" stand next the central figure. The panels are situated on each side of the main entrance.

Crosses. THE movement for restoring the old crosses in churchyards and market-places appears to have received considerable impetus of late. In some cases—the majority perhaps—it takes the form of placing an entirely new cross on the old base; in others, where shaft and steps escaped destruction, it has only been necessary to provide a new head, while occasionally the mutilated capital itself has been unearthed, and the original monument has been deftly pieced together. In Devonshire recently the late High Sheriff, Sir Robert Harvey, has restored the churchyard cross at Harberton, the birthplace of Charles Kingsley. The late Canon Carter erected a handsome cross in the churchyard at Clewer; and Mr. G. E. Street, the architect, put one up as a memorial to his wife in a Surrey village. In London a churchyard cross has been erected at St. Mary, Haggerston; and Mr. H. C. Richards, M.P., has recently placed a fine Celtic Cross of Kilkenny marble in the old churchyard of St. John at Hackney to the memory of his parents. This cross is placed near the old tower of St. Augustine, on the west side of the churchyard, one of the very few detached belfries existing. At Inverness Sir Robert Finlay has restored the market cross, while that at Hastings is shortly to be revived. There is a fine old market cross at Chichester, which appears to be crumbling away.

Towneley Hall. THE Burnley Corporation has just purchased Towneley Hall, one of the most ancient family mansions in East Lancashire. Towneley Hall lies a little to the south of Burnley, although Whitaker believes that the original site of the mansion was a "tall and shapely knoll" rather to the south-west of the present structure. It has battlemented walls and protecting turrets, and is quadrangular in form. To-day only three sides of the quadrangle remain; the fourth side, which contained the gatehouse, domestic chapel and library, having suffered demolition in the time of Queen Anne. In some places the ancient portions of the walls are more than 6ft. thick. The most attractive part of the mansion is the domestic chapel near the great hall, and apart from this the building is a little inferior to most of the famous Lancashire halls. It is probable that the great hall in the mediæval days was an apartment of much magnificence, but early in the eighteenth century it was converted into an entrance hall, decorated in the Italian style. The present windows, which are Domestic Gothic in style, are contemporaneous with this alteration, but the original walls remain untouched, and the beautifully carved and ornamented door leading into the quadrangle still remains where it was placed in 1530. The chapel is supposed to date from about the middle of the fifteenth century. The entrance door to the chapel is well carved, and there is an entrance to a small priest's room on the north-west side.

The Parthenon. THE late Empress Elisabeth in 1895 saw, at an exhibition in Vienna, a plaster group by the Austrian sculptor Herr Schwezech, representing a reconstruction of the western end of the frieze of the Parthenon. Her Majesty was so pleased with the work that she gave Herr Schwezech an order for a similar group, representing the reconstruction of the eastern part of the frieze. Before the sculptor had finished a sketch of it the Empress died. He went on with his work, however, and finished the eastern frieze, satisfying himself by a visit to Athens and a careful study of the building that his reconstruction was in harmony with the original design of Phidias. Recently the Emperor Francis Joseph, who till then had been ignorant of the order given by the late Empress, inspected the model, which is on a scale of one-eighth, and expressed his great satisfaction with it. It was Herr Schwezech who modelled the statues of Cato and Lycurgus for the Austrian Houses of Parliament. He has also designed monumental works, but up the present has been little known outside his own profession. The work of strengthening the foundations and structure of the Parthenon has been making good progress. The King of the Hellenes frequently visits the Temple, and shows the keenest interest in what is being done for its preservation.

Cretan Exploration. THE revelation of a great palace on the site of Phæstus, in the south of Crete, by the Italian archæologists Halthew and Pernier last spring almost rivalled in interest Mr. Evans's discoveries at Knossos. News now comes that since the departure of the Italians for the autumn peasants have lighted on a series of rock tombs in the neighbourhood of the palace, evidently belonging to some generation of its lords. These tombs, which are both of the dome and chamber types, contained several skeletons apiece, richly adorned with gold objects, such as necklaces and rings, in which are set engraved gems representing cult-scenes, demons and other typical Mycenæan subjects. The discovery is of exceptional interest, since no tombs have hitherto been found pertaining to the great Cretan palaces, and it is only in tombs that the richer objects of the luxurious prehistoric civilization of the island are likely to be found.

Discoveries in Asia Minor. HERR DÖRPFELD, the Director of the German Archæological Institute at Athens, delivered an interesting lecture recently on the excavations at Pergamus, in Asia Minor, which are being carried on by German explorers. Herr Dörpfeld, who lately paid a visit to the spot, saw the foundations and a portion of the walls of an ancient Christian church which has been discovered in the market-place. The building has a large peristyle and a baptistery, and must have been erected before the destruction of other buildings in the market-place, which were demolished during the Roman dominion or under the early Byzantines, as it contains none of the stones belonging to them. The discovery of the church is especially interesting, as it is one of the seven mentioned in Revelations. Dr. Dörpfeld detected a marked resemblance between a water reservoir at Pergamus and the famous fountain of Kallirhce, near Athens, which he himself discovered.

Law Cases.

Baker Street and Waterloo Railway: Claim for Excavation Material.—The case of *John Shelbourne & Co.* v. *Perry & Co.* came before the Commercial Court last week. The plaintiffs sought to recover damages from the defendants (who were the contractors for the Baker Street and Waterloo Railway) for breach of a contract, dated June 5th, 1899, by which the plaintiffs were employed to cart away the surplus earth and other material excavated from the tunnel and shafts of the railway. Briefly, the dispute was as to whether the plaintiffs were entitled to the cartage of all the material excavated, or whether the defendants were at liberty to dispose of it in other ways. Mr. J. A. Hamilton, K.C., and Mr. Lochnis appeared for the plaintiffs; Mr. Scrutton, K.C., and Mr. C. Herbert Smith for the defendants. Mr. Justice Walton, in delivering judgment, said that no serious difficulty arose between the parties till September, 1900. It had originally been the intention of the defendants to do the work of tunnelling by driving tunnels north and south from a shaft on the river and north from the Piccadilly shaft. It was not at first intended to drive the tunnel from Piccadilly to the river, but the scheme was altered in March, 1898, and it was decided to drive the shaft between Piccadilly and the river, working at both ends. That was done, and in September, 1900, the two tunnels met. It then became possible for all the excavated rubbish to be removed by the river shaft, and it was less expensive to do so than to remove it at the Piccadilly shaft under the plaintiffs' contract; and accordingly some of the excavated material, which before the two tunnels met must have gone by Piccadilly, was removed by the river shaft. The result was that the plaintiffs did not get as much material to cart as before, and they wrote to the defendants complaining of this. After December 22nd, 1900, no further rubbish was removed at Piccadilly, and this action was then commenced. The plaintiffs' case was that they were entitled to do all the cartage for a certain section of the line, which section could be ascertained by reference to their letter of January 27th, 1898; and that that letter also specified the quantity—viz., 53,000 cub. yds. of earth—which they were entitled to have; and that that obligation of the defendants had not been fulfilled. On the other hand, the defendants said that they were only bound to give to the plaintiffs such excavated material as should in the course of working be removed from the two shafts in question. Now the contract itself did not define any particular part of the railway as being appropriated to the contract, nor did it say how much material was to be removed; it only said that the plaintiffs were to remove everything that came from the two shafts. It was said that the contract must be read with the letter of January 27th, 1898. The letter did no doubt contain a representation that there would be 53,000 cub. yds. to be removed at the Piccadilly shaft, but it was not suggested that that representation was made otherwise than honestly, and the letter did not, in his Lordship's opinion, impose any contractual obligation upon the defendants. The contract alone could be looked at to ascertain the extent of the defendants' obligations, and there was nothing in the contract binding the defendants to do the work in any particular manner, or giving the plaintiffs the right to have any particular quantity of material removed at the Piccadilly and Oxford Street shafts. The result was that the defendants had not committed a breach of the contract, and there would be judgment for them with costs.

A Leeds Obstruction of Light Case.—At the West Riding Assizes recently William Richardson, furniture dealer, sued the Overseers for the Poor of Leeds in respect of obstruction of light. The plaintiff occupies the basement and ground floor of premises in Park Lane, and at the back is the building occupied by the Leeds Overseers, with a frontage in South Parade. His Lordship wanted to know if the ground floor of the plaintiff's premises was above the level of the pavement. He was told this was so, and he thereupon commented that he had noticed this was a peculiarity of Leeds; the basement was improved by lifting up the ground floor. The defendants altered their premises, and the result was that the light derived from four windows in plaintiff's rooms was obstructed. He had now to burn gas continually, and the fumes rendered necessary more frequent renewal of paint and wallpaper and injured the polish on the furniture. Further, it was contended, plaintiff could not display his goods to the same advantage as before, and he thereby lost custom. An elaborate wooden model of the two buildings was produced showing the positions before and after the alterations.—Mr. John Hepper said that before the light was interfered with plaintiff's basement was worth 6s. 6d. per sq. yd. per annum, and the obstruction of light had depreciated it 1s. 6d. per yd., or £17 14s. per annum. The 292 sq. yds. of the first floor were worth 10s. per sq. yd., and he considered the depreciation was 2s. per yd., or £29 4s. per annum—a total of £46 18s. per annum. Plaintiff's lease had 7½ years to run, and the damage capitalised was put at £297 13s. 4d.—The jury found for plaintiff, and awarded him £120 damages. Judgment was given accordingly.

A Libel Action.—In the King's Bench Division of the High Court of Justice last week Messrs. A. B. Rathborne and J. E. Hill, stockbrokers, of 10, Moorgate Street, brought an action for libel against Mr. Harry Hems, of Exeter, claiming £500 damages. One of the plaintiffs instructed defendant to prepare a tombstone, and to erect it over the grave in the churchyard at Sutton-on-the-Hill, in Derbyshire, where his wife was buried. The cost was to be £48. Before concluding the work Mr. Hems requested an instalment of the cost, and when asked why he wished for the money in advance he sent a copy of a letter received from a trade protection society in which the plaintiffs were referred to in somewhat dubious terms—the inference being that they carried on an irregular and disreputable business, and that they were not members of the Stock Exchange, and were persons of no credit. The Lord Chief Justice said he was clearly of opinion that there was no case to go to the jury. The letter complained of was written in reply to one from Mr. Rathborne. Such reply was addressed to Mr. Rathborne personally, and he held that it was a privileged communication. Plaintiffs were accordingly non-suited.

MR. A. JEFFERY ON STAINED GLASS.

At a meeting of the Sheffield Society of Architects and Surveyors held last week, Mr. A. Jeffery delivered a lecture on "Stained Glass." He said that the first stained glass executed in England was in the time of King John. Previous to this all glass came from Italy, which even at this date boasted of eminent artists. The old masters taught us many lessons, and much could be learnt from them. We should try and embrace all the good qualities of the old men, ignore their shortcomings, and try to improve on what had been done before us. After the sixteenth century stained glass died out, and did not again revive until the nineteenth century. Mr. Jeffery went on to explain that a window should be part of a building, and should not be treated as a picture or wall decoration. If a man attempted a picture he spoiled his material as glass and made a very bad picture. The lecturer described the different methods of manufacture. He said that English glass was superior to foreign, both in material and workmanship. The most important point in a window, in his opinion, was permanency, and only the most permanent of colours should be used, at whatever cost. Speaking of domestic glass, he did not think the modern style was a passing fancy, but that it had come to stop, but like all other transitions in art at the outset it seemed to have been let loose, and we appeared to be seeking after something we could not quite grasp. But the style would ultimately settle down and find its own level. Mr. Jeffery, in conclusion, said he was eagerly looking forward to the time when there would not be so much commercialism in connection with artistic crafts, and he hoped architects in the near future would come more into contact with the craftsmen, and by their joint ideas succeed in raising the standar of work.

ABERDEEN'S NEW POORHOUSE.

A NEW poorhouse for Aberdeen is to be erected at Oldmill from plans prepared by Messrs. Brown & Watt, architects, Union Terrace, Aberdeen. Accommodation will be provided for 650 inmates, besides for the necessary staff, including nurses and other officers. The central building will be the poorhouse proper, and will contain also the general administrative department for the whole institution. The dining hall will form the central features in this block, and connected with it will be the kitchen and other accessories of the culinary department, including a large two-storeyed store. On the west side will be the wings providing accommodation for the different classes of male inmates, and on the east side will be the corresponding wings, with similar accommodation for the female inmates. Adjoining the female department will be the children's block. To the rear of the administrative department the boilers and laundry and wash-houses blocks will be situated, and connected with these will be the "stick" house and other labour departments for the male inmates. To the west of the main building, and retired a little further to the north, the general hospitals block has been provided for. A little further to the north is the site of the special hospitals. A nurses' home will be provided in a separate building. The porter's lodge is to be placed at the entrance to the avenue from the Skene Road, and immediately in the rear of this lodge will be placed the probationary wards, one for each sex, and each containing a day room and dormitory with ten beds. The site comprises about fifty-five acres of arable land, where the present buildings of Oldmill Reformatory now stand.

LEEDS SCHOOL OF ART.

THE new School of Art in Leeds is now being erected. The building will accommodate twice as many pupils as the old school, which, as a Government School of Design, was established in 1846.

The necessity of making better provision for the School of Art has been felt by the committee for some years. Last year they decided to invite competitive designs for a new building, the cost not to exceed £10,000, a substantial portion of which the committee hope to raise by means of donations. The design by Messrs Bedford & Kitson, of Leeds, was selected on the recommendation of the adjudicator, Mr. W. H. Bidlake, M.A., of Birmingham. The new building will have frontages in Vernon Street, Percival Street and Cookridge Street. In character the building will be quite plain, but on the west elevation, facing Cookridge Street, provision will be made for a panel, which will be filled in by the students in glass mosaic. In the basement provision will be made for classes in the applied arts, including plasterwork, repoussé, enamel, marble and stone carving, woodcarving and cabinet work, pottery, painting and decorating, lithography and bookbinding. On the ground floor there will be a light and shade class-room, a model and freehand class-room, and a lecture-room capable of seating 100 students. The first floor will afford accommodation for a painting class-room, an architectural class-room, a design-room and library, and an elementary modelling-room. On the second floor there will be the life-room antique-room, life-modelling room, master's room, and a conservatory for plants to be used in the school.

ARMY WORKS REFORM.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Mr. Brodrick seems really determined to put our Army right. As an outcome of the Boer War, as well as the result of former Press agitation, a committee has now been formed to enquire into Army works, the barrack scandals of which under the Royal Engineers have become notorious. The committee is composed of Lord Esher as chairman, who is secretary of H.M. Office of Works; Major-General Leach, R.E., General Officer Commanding the Belfast District; Mr. Macvicar Anderson, F.R.I.B.A., past-president of the Royal Institute of British Architects; and, as secretary, Mr. J. M. Bull, of the Accountant-General's Department, War Office. This is a good selection; but to make the Board thoroughly impartial there should have been added a representative of the civil architects, officially styled surveyors, who are employed in the department to do the actual professional work for which the Royal Engineers have so long obtained the credit. Unless this is done, or present members are very wide-awake, the old one-sided system is likely to continue. A medical officer should also have been nominated.

The barrack department originally was wholly civil, but after the battle of Waterloo the Duke of Wellington caused it to be handed over to the military engineers in 1822, solely to prevent their disbandment after the Peninsular Wars. The real technical work, however, was still done by civilians, and has been so performed down to the present day. In 1862 a Barrack Works Committee (consisting of four military officers and three civilians) was formed, and after this the Royal Engineers endeavoured to do away with their civilian helpers altogether, giving their old clerks of works special inducements to retire. They replaced them by military foremen of works—tradesmen enlisted as sappers, who go through a year's course at Chatham. Civilian "surveyors"—really architects and civil engineers (who number 66, although the original warrant was for 78)—were introduced by Civil Service examination in 1882 to bolster up the amateur officers and correct the work of the military foremen of works. In addition to these a host of temporary civilians are employed, in the guise of surveyors, surveyors' clerks, draughtsmen, clerks of works, foremen of works; while the barracks are erected by civilian contractors. The Royal Engineers merely do administrative work, sit tight, and take all the credit. At the present time three-fourths (in some districts four-fifths) of the staff are civil, yet they are carefully kept out of sight and are unknown.

Barrack scandals could be quoted galore, but my object is to place before your readers both sides of the question as to whether the charge of Army buildings should continue under soldiers or under trained architects. Here are the arguments and answers, all cut-and-dried for the Committee.

Military Arguments.

1. Military men for military work.—*Answer:* The building of barracks is *not* military work, but civil work pure and simple.

2. The Royal Engineers are specially qualified for designing military buildings, being soldiers. —*Answer:* This is not so, as the first and all-important qualification is the practical technical knowledge, which can only be acquired in an architect's office and on works. One might as well argue that clergymen are the best men to design churches, doctors to design hospitals, schoolmasters to design schools, lunatics to design asylums, or the householder to plan his own house. But all such people engage architects for lack of their technical knowledge, giving them the necessary data to go upon. Even builders themselves employ architects to design residences for them. The construction course at Chatham only lasts five months, and is purely book-work.

3. The Royal Engineers are superior men.—*Answer:* It is difficult to see where this superiority comes in, as many architects and civil engineers are of equal birth and education. Many of them are much better educated, being university graduates and having professional diplomas besides, which can only be obtained by further examinations.

4. The designing of barracks is not architecture, but only construction.—*Answer:* Even so, a proper and practical knowledge of the latter can only be obtained in an architect's or builder's office after a number of years. It cannot be learnt in book classes at Chatham, nor yet as division officers on barracks. Royal Engineer officers begin at the top and stay there, but to learn one must put aside dignity and begin at the bottom. If they want to be taught construction, then they should be placed *under* the civilian surveyors, who will teach them. But as a matter of fact a great deal of skilful designing *is* required for barracks, which can only be gained with a qualified architect (Sanmicheli is an example of a military architect).

5. The Royal Engineers must be employed in time of peace.—*Answer:* Of course! But that employment should be the same as they will be called upon to do in war—not tinkering at barracks.

6. Works fill in spare time of engineers.—*Answer:* General Sir Richard Harrison, R.E., Inspector-General of Fortifications, stated before the recent Committee on the War Office, 1901, that the corps does many duties, and that they would be wasted if not employed on works, which fill in their spare time, and economy is thus effected. This sounds very well; but if Royal Engineers have any spare time it shows that they are not fully employed on their proper work, which they should be. Secondly, if they do ever have any spare time it should be occupied in *military* duties, not fiddling over barracks. Military science is so great nowadays that the hardest worker can never hope to learn it all. Thirdly, the employment of Royal Engineers on works is a great extravagance instead of economy, because they have far higher salaries than qualified civil architects could be got for; and because of their incompetence they squander thousands which civil architects would save both in planning and execution; also because they are amateurs they are forced to employ civil architects already (called "surveyors" and "draughtsmen"), so that there are actually two sets of officers in the Department—the civil, who really do the work at modest salaries, and the military, who simply supervise, get all the credit, and pocket the large salaries.

7. A Civil Department would not be under military control.—*Answer:* Why not? Every branch of the army in a district is under the General Officer Commanding, and one might just as well say that the civilians in the Royal Engineers Department are not under the control of Engineer officers, whereas they are unfortunately very much so. If the architect officers of the Works Department were given commissions (which they ought certainly to have in order to give them a proper standing) this would at once place them under the full military control of the General Officer Commanding. But if they were not, they would still be under the orders of the General. It must also be remembered that before 1822 the barrack department was wholly civil.

Civil Arguments.

1. Barrack work is not military, but purely civil.

2. Permanent barracks are never erected in war. An army is always on the move, and the troops need only be sheltered under canvas, or by temporary huts, which any labourer can knock together. Wars nowadays are of short duration, and there would be no time to erect substantial buildings in any case.

3. The Royal Engineers cannot possibly be technically trained for the erection of buildings at Chatham, or at any college, or by books. They are amateurs at the best, and practical knowledge can only be gained in a proper office or on works. Architects do not think five years too long to learn their profession in, yet the building and civil engineering course at Chatham only lasts *five months!* The subject of design only occupies three weeks!

4. The Royal Engineers have military ideas incompatible with civil work. For instance, they think it *infra dig.* to draw, saying that is only a draughtsman's business; yet all architects are experts at drawing, as it is the first essential in their profession. They do everything by order, expecting laborious technical operations to be executed in five minutes like a military command. Should a civil official, or a contractor, point out the absurdity of any order, he is peremptorily told his business is to obey, no matter if the work is all wrong. Royal Engineers cannot appreciate the work of the civilians who bolster them up, and the latter never get credit for their ability.

5. A Military Works Department is quite dislocated if a war breaks out, as its military officers, non-commissioned officers and men are liable to be called to the front. Their places have to be filled by volunteers, militia, civilians, and any Tom, Dick, and Harry, hastily collected as temporary stop-gaps. These outsiders know nothing about the Department, and have to be taught their business; but they are put above permanent men, which causes ill-feeling, and is grossly unjust. The result is confusion worse confounded.

6. A Military Works Department is upset even in peace time by officers, non-commissioned offices and sappers having to leave their barrack work to do military duties. Officers go away for weeks at a time to train for their examinations for promotion. Military foremen of works, military draughtsmen, and military clerks (who are non-commissioned officers or sappers) are often absent from the office for portions of days, and sometimes whole days together, to go through courses of musketry, field works, drill, &c. The work is dislocated, or comes to a standstill, in consequence. Drawings, estimates, papers, &c. are frequently taken away from these military people altogether, and handed over to the civil employees, who soon get them done and are always at hand. The military must retire at 55, at their prime, and before the State gets the full benefit of their experience, while the civilians can stop till 65.

7. The dual elements create endless friction. The Royal Engineers keep down their civilian helpers in every way, and make out that they are only subordinates, lest the army and the public should find out the truth. This is naturally resented, and the civilians take every opportunity of exposing the ignorance of the military officers over them, for whom they have no respect; and there is no harmony.

8. In a Military Department the officials do not stop long at one station, whereas those of a Civil Department would. This is most important, as continuity in a Works Department means everything. As soon as an official has learned all about a station, the peculiarities of local materials, the dodges of local contractors, &c., he is packed off for no reason whatever beyond that he has completed five years there. If he is in charge of an important contract, which it is most advisable he should see through, it makes no difference—he goes. It is this perpetual changing which has led to more than one barrack scandal.

9. Civilians honestly do their work, think nothing of long hours, as they are accustomed to them, whereas military officers are more imbued with the idea of being "an officer and a gentleman" than with the spirit of labour.

10. Civil architects come into the Department *already trained* and cost the State nothing for their education. This would save the up-keep of an expensive Chatham staff, and their unsatisfactory productions.

11. Civilians get on with builders much more amicably than military officers, who ride the high horse and sit in state in their offices.

12. Civil architects take a genuine interest in barrack work, which Royal Engineer officers do not, as they are only amateurs and do not understand the technicalities of building operations. The more knowledge one possesses of a subject the more interest one takes in it.

13. All our barracks and fortifications are *already* designed and carried out by civil architects, conveniently styled "surveyors" and "draughtsmen," and they are put up by civil contractors and not by sappers. If all the Royal Engineers were cleared out to-morrow the Department would go on without one iota of inconvenience, and of course far more smoothly. The Royal Engineer officers do not do a stroke of drawing, specifications, quantities, measuring, &c., or any technical work whatever. They merely do administrative duties, supervise, and paralyse the work with correspondence. Therefore, as regards reform, it is only necessary to

dismiss the military element, and the remainder will enable the Department to work without a hitch. No increase of staff would be required, and great economy would accrue all round.

It has been proposed to hand barracks over to the Office of Works, but that would not suit, as the officials of that Department know nothing about military requirements, and they have quite enough to do in designing civil buildings, such as post-offices, &c. It would also mean the interference of a Department which is altogether outside.

The most obvious and sensible course to adopt is to create a proper Army Works Department, composed of the civilians already in it, who know their business; the officers to be called district architects, so that everybody would know exactly what they are, as the term "surveyor" is ambiguous. The nucleus for these already exists in the district surveyors, who are civil officers and really architects. Commissions should be given, but the officials would still remain civilians. We have the Army Medical Corps, Army Pay Department, Army Ordnance Corps, Army Service Corps, Army Chaplain's Department, and why not the Army Works Department? The new title would thus be in line with others. The time has long been ripe for a drastic reform in this branch of our army, and it is sincerely to be hoped that the Committee will unflinchingly give an impartial verdict.—Yours truly, REFORMER.

The Late Charles J. Innocent.

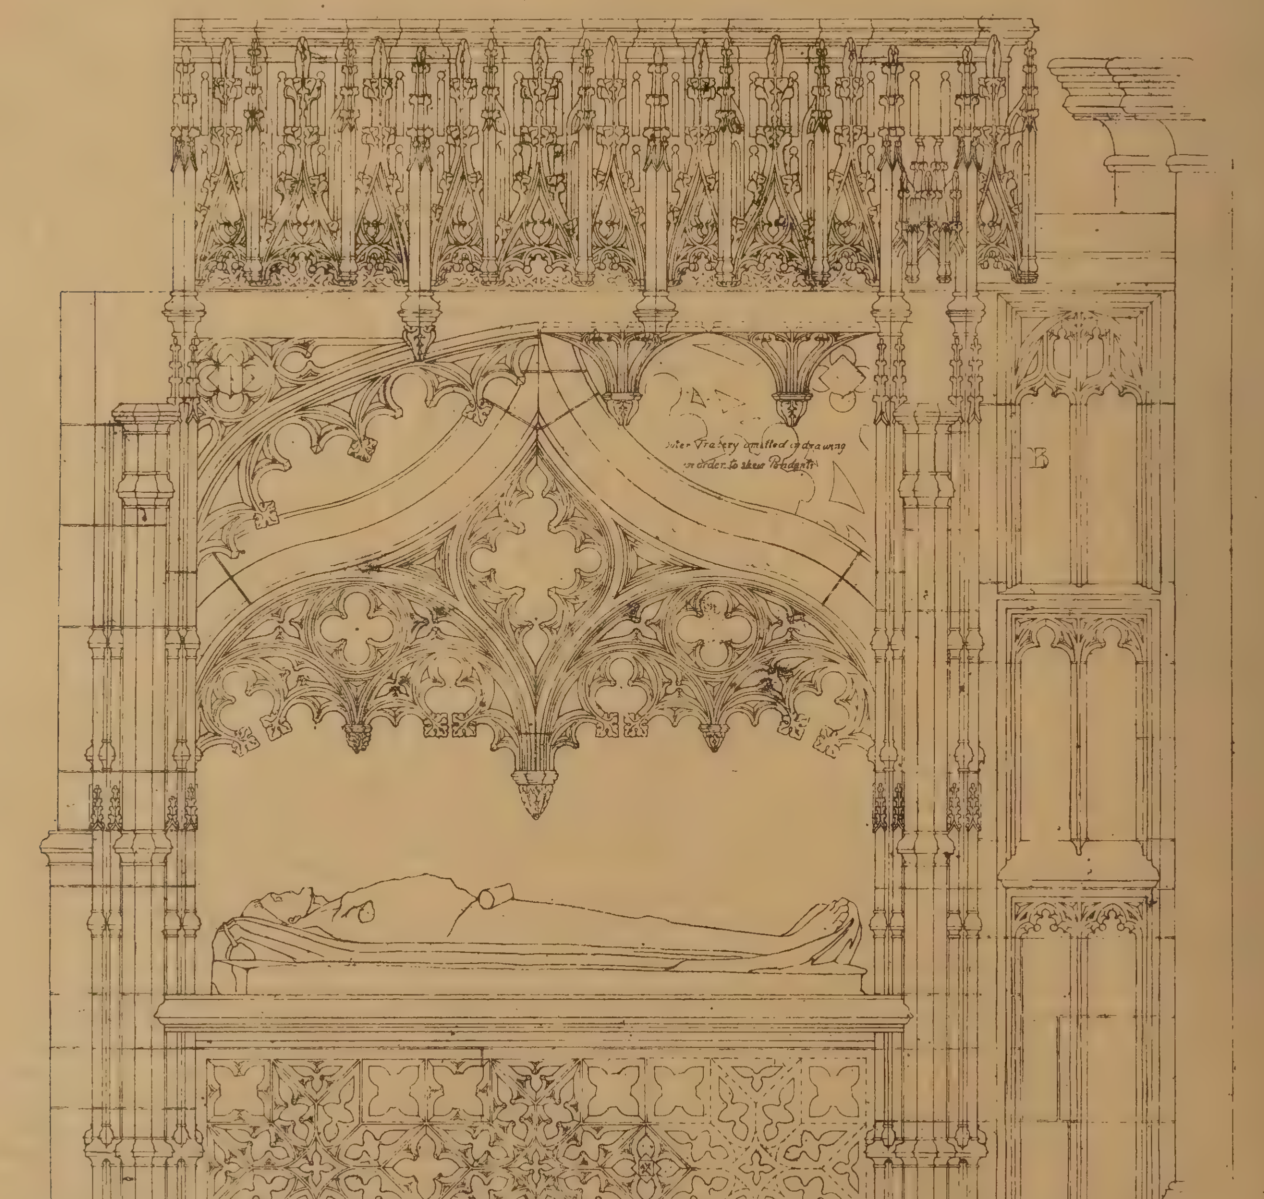
To the Editor of THE BUILDERS' JOURNAL.

EXETER.

SIR,—Referring to your kindly and sympathetic notice in last week's issue, permit me, as a life-long friend and an old schoolfellow of the late Mr. Charles J. Innocent, to point out that it was in conjunction with his partner, the late Mr. Thomas Brown, that the deceased was appointed architect to the Sheffield School Board. His book of "Illustrations of Public Elementary Schools erected for the Sheffield School Board," 1873, deals with fifteen local schools then already erected by the partners.

The late Mr. Thomas Brown, like Mr. Innocent, was articled with the then well-known firm of Messrs. Weightman, Hatfield & Goldie of Sheffield. Both the partners were, like myself, pupils of the Sheffield School of Art, the school that the late Alfred Stevens, the sculptor, attended.—Yours truly, HARRY HEMS.

The Cenotaph of Abbot Wakeman in the Chapel of St. Edmund, Tewkesbury Cathedral, is a peculiarly beautiful piece of work dating probably from the beginning of the sixteenth century. On the slab is a representation of the corpse of a monk undergoing the process of decay and being devoured by various lizards, snails, &c.—a rather gruesome contemplation. Immediately over the body, in the centre of the tomb, is a massive ogee arch, richly foliated, from which depends a rather cumbrous pendant The front of the tomb, as seen from the ambulatory, is composed of a very fine arch with its lower edge foliated and the spandrels enriched with quatrefoils. At the top is a projecting canopy in three main sections—a portion of the rest is gone—all of very delicate and intricate carved work.



CENOTAPH OF JOHN WAKEMAN IN TEWKESBURY ABBEY.

New Patents.

These patents are open to opposition until January 20th 1902.

1900.—Heating and Ventilating.—20,239. J. Keith, 27, Farringdon Avenue, London, E.C. Tubular pillars (of wood lined with metal, or of metal alone, porcelain, or other suitable material) rest on the floor, or are suspended from the ceiling. These pillars contain hot-water or steam radiators, and have enlarged air exits fitted with a fan (preferably of the Blackman silent type driven by an electro-motor). Air is taken in at the bottom of the pillar, is heated by the radiators, and is then discharged by the fan into the room at any height. If desired it may be blown against the ceiling or against a domed cushion.

Gas Stoves.—22,645. C. Humfrey, Hilderstone, Hartford, Cheshire. In order to render cheap gas available for domestic heating by open grates, a metal coil is arranged behind the back of the fire. In this way the gas is superheated before being burned, thus improving the efficiency of the grate.

1901.—Fittings for Lavatory Basins.—2,482. N. E. Cooke, Swadlincote, Burton-on-Trent. Extending upwards from the bottom of the basin is a metal tube arranged between two flanges which are separated by distance pieces; and when this tube is raised by the hand the water flows through these latter and so into the waste-pipe. The tube can be kept in its raised position by giving it a turn, or this may be automatically effected by a pin and slot action. The tube extends to the top water-level of the basin and acts as an overflow.

The following specifications were published on Saturday last, and are open to opposition until January 27th, 1902. The names in italics are those of the communicators of the invention. A summary of the more important of them will be given next week.

1900.—20,940, Burdick, apparatus for facilitating the application of colours or liquids to paper, wood, &c. 21,189, Dodd, automatic apparatus for controlling storm waters, compensation waters and flow of sewage. 21,247, Morison, valves. 21,483, Rawson & Littlefield, manufacture of refractory impervious bricks, &c. 21,668, Dyson, apparatus for checking and recording workmen's time. 21,967, Kotko, pantograph for making several copies on different scales at a time. 22,537, Asplen, road-roller scarifier. 22,938, Evans, bolts. 23,256, Forster, calculating slide-rules. 23,823, Locke, slip bolts for doors.

1901.—59, Lees, Lees & Lees, guard for woodworking machinery. 1,040, Green, lifting latches. 1,180, Wells, couplings for metal pipes. 1,272, Russell apparatus for heating buildings by steam. 1,751, Bennett, dry closets. 2,219, McAllan, hinging double-hung window-sashes. 2,303, Sagar & Sagar, hand or hand-and-roller feed wood-planing machines. 3,575, Walton, self-locking pulley-blocks. 9,870, Winn, apparatus for cutting pipes, rods, &c. 12,364, Wright & Darwin, burners for gas heating and other stoves. 12,898, Jones & Stuckey, window-blind bracket. 16,547, Howden & Hume, refuse-destructors. 16,697, Roeder, radiators. 16,794, Barreto, bricks. 18,253, Haddan (*Clayton & Lambert Manufacturing Co.*), plumbers' portable furnaces. 18,303, Schley & Langewiesche, tool for shaping cornices or mouldings in rooms. 19,780, Lewis & Lewis, adjustable swimming baths. 20,130, Goodrich, vices. 20,304, Blancke, tool-holders for planing-machines. 20,446, Humphries & Haigh, means for facilitating the removal of window-sashes. 20,901, Ramsay, veneering or coating bricks.

The Large Hall of St. Winifred's Unsectarian Mission, at Rotherhithe, has just been redecorated by the Kyrle Society. The paintings are the work of Mr. Audley Mackworth, who has presented them to the mission. The central picture, which measures 9ft. by 7ft., represents the "Mayflower" carrying the Pilgrim Fathers to New England.

BUILDING CONSTRUCTION.

(Continued from p. 303 of No. 357.)

59. Having regard to the extent to which thatch, of one material and another, is made use of for roof-coverings, I think it advisable to give some definite information in regard to thatched roofs. The hide of such an animal as a cow may be taken as a type of a thatched roof. The hairs are held fast to the skin at their upper ends and lie in contact, having the same general direction; water, owing to the surface-tension, bridges from one hair to another, and the surplus water is drawn by gravity downwards along the hairs. Whether suggested by the pelts of animals, by the branches of trees, or by other natural shelters, this form was probably the most obvious to savage men; and it is the most common roof-covering employed the world over by people whose resources are not great. We have seen how the Connemara peasant covers his cabin with grass from the neighbouring bog marsh. He has neither straw nor scollops; in some cases rushes are used, and often rushes mixed with flags and other long-leaved plants. The character of the materials varies from one locality to another, and it varies much more widely in different countries of different climates.

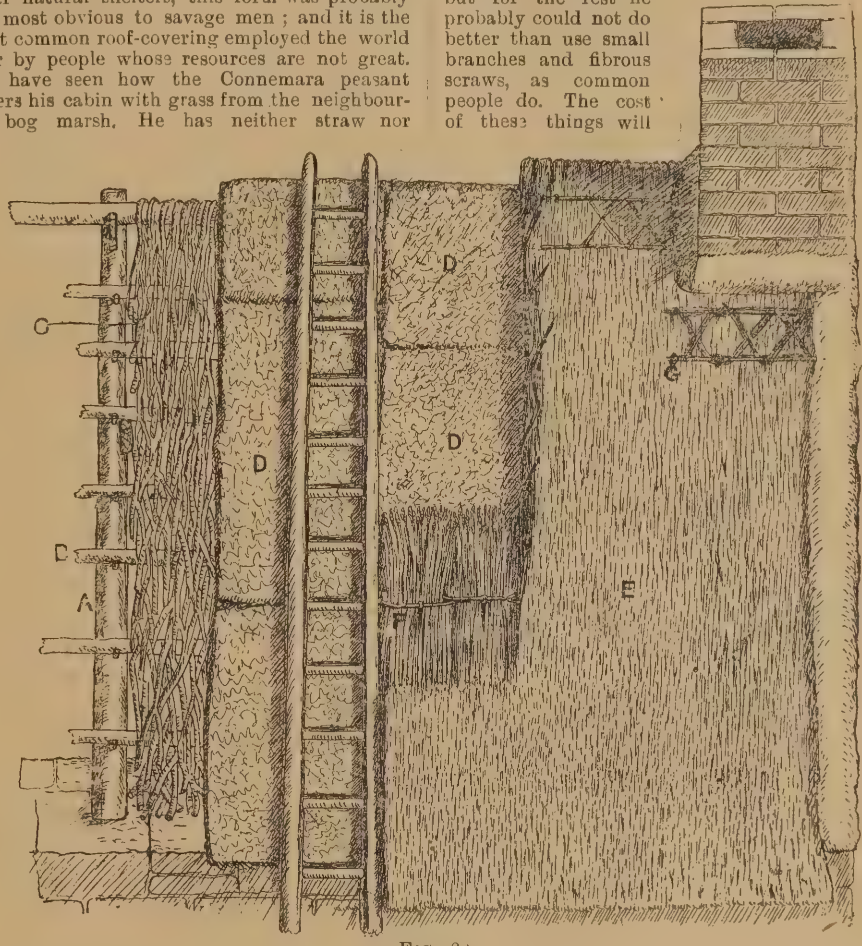


Fig. 80.

Fig. 80 is an illustration of a roof in process of being thatched. A is a couple, B are rough purlins, C is the covering of small branches, D are "scraws," and E is the finished thatch. I have already described (paragraph 55) a thatcher at work; I have only to add a few points to make the simple operation intelligible. A thatched roof ought to have a pitch of not less than 45 degs. The first coat is fastened to the scraws by the scollops F (the scraws are the most fibrous to be had, a minimum of earth and a maximum of fibrous roots; they are laid with the grass side up). These scollops will be covered by the next layer; but every good thatcher is very careful to give each scollop an inclination *with the fall* of the roof so that no scollop will guide any possible wet in towards its point; and to provide for this, and at the same time for sufficient fastening, the pitch needs to be at least 45 degs. The first coat of straw should be about 12in. thick (subsequent coatings may be much less, 4in. to 6in.; any hollow places must be brought up). I have seen a "town" of farm buildings thatched with flax. A crop of flax, the farmer informed me, had got damaged, and he thatched his buildings with it; he said that it would be a very lasting roof-covering. Apart from exceptional cases like this, the best thatch in this country is of good *rye* straw; but a good deal of very good work is done with *wheat* straw. A thatcher and his assistant will cover three "strikes" in a day, and for this they will use in new work about 6 cwt. of straw and 600 scollops. A "strike" is the portion thatched at each change of the ladder, and, of course, depends for its area upon the length of the roof; its breadth is about 2ft. 6in. It may be taken that a good thatcher will do about 1¼ squares in a day, and the work will take the above given quantity of materials. If an architect were specifying for a thatched roof he would probably use sawn timber for his couples and purlins, but for the rest he probably could not do better than use small branches and fibrous scraws, as common people do. The cost of these things will differ in different places; but there can be no great difficulty, from the details I have given above, in estimating the cost of a thatched roof. In my locality a square of new thatched roof would cost:—

		£	s.	d.
Proportion of couples - -	these include labour	0	4	0
Purlins - - - - -		0	3	0
Branches and scraws - -		0	3	6
Straw, 5 cwt. at 3s. - - - - -		0	15	0
Scollops, 500 - - - - - -		0	1	0
Labour—thatcher and attendants - -		0	6	0
		£1	12	6

This will last as a fairly good roof for twelve years, when it will require a fresh coat of thatch at a cost of about 10s. a square; and it will thereafter require a fresh coat every twelve years.

In many situations thatch may be a suitable roof, conveying no suggestion of poverty or misery; on the contrary, well-kept thatch which has been thickened out with regular coatings showing deep overhanging eaves may indicate the generous orderly prosperity which we like to associate with rural life. There is no need to argue that thatched buildings may have all the agreeable qualities which we may desire buildings to have as works of art; thatch is just as good a material in suitable places as any other. Thatch is not suitable on high or exposed buildings; it is altogether out of place in market-towns, where the drip from eaves, which cannot well be furnished with proper eaves-gutters, is bad for pedestrians, both directly, and indirectly, by maintaining a sloppy footpath. The drip from thatch-eaves is a troublesome defect everywhere. The usual provision is to pave (with round cobble pebbles) a margin of 3ft. or 4ft. from the base of the wall, which prevents the formation of a hollow. Unless the eave has a very wide projection the water when it falls splashes up against the wall, and we have a growth of green moss rising some height from the ground. I have never yet seen an æsthetically successful thatch eaves-gutter. Special care must be taken in threshing for straw that is to be used for thatch. It is bad for it to be broken, as it will be if threshed in a threshing machine; the grain must be removed without damaging the straw. The best mode of threshing is to divide the sheaf into handfuls; as much as can conveniently be held is caught near the butt in the hands of the thresher, and he strikes the heads strongly over a round piece of timber (a cask lying on its side is a suitable block). When the grain is taken off, the straw is neatly made up into sheaves and bound in the usual way. With good straw a thatcher can neatly regulate the surface of the roof without any knife-dressing. Tossed straw is sometimes used, but it is quite unsatisfactory. Oat straw is sometimes used for thatch, but it is not good enough.

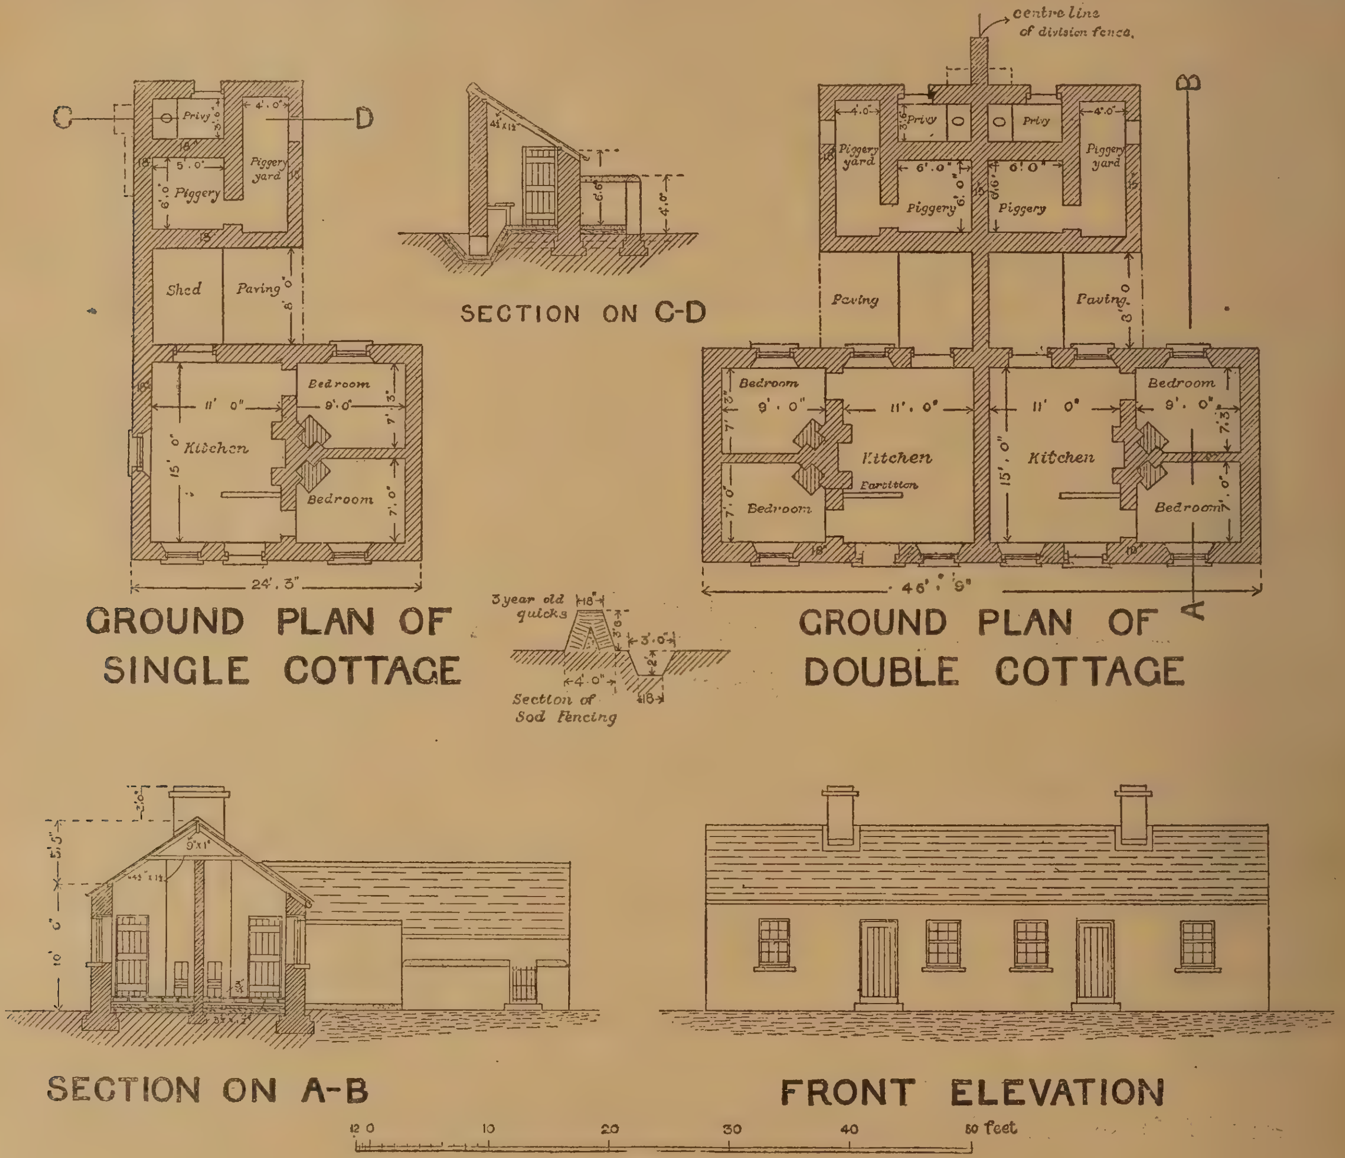

FIG. 81.

60. Fig. 81 shows drawings of labourers' cottages about to be built by the Rural District Council of Portumna, designed by Mr. John Smith, M.I.C.E., county surveyor, of Ballinasloe. I make use of these drawings as representing this class of house: the details which I give may not be as arranged by Mr. Smith, but they are probably not much different.

Walls.—The walls of these houses are built of what I have heard named *raked* rubble masonry. This kind of masonry is quite common, though it does not agree with any description or drawing that I have seen. It is usually built in courses; it is hammer-dressed, and spauls are used to level up the courses and to fill up openings between the larger stones. When built with good mortar it is perfectly good masonry for walls of moderate height, such as these walls are; moreover, it gives a better hold to the rough-cast than closer jointed work would do. The carboniferous limestone of the neighbourhood shows very slight indications of stratification; and the usual condition that stones are to be laid on their natural beds is of slight importance, as is also the case where the stone is granite or whinstone. But a matter of *very great* importance is that the sand with which the mortar is mixed shall be clean and free from earthy or clayey matter. Where the duty of mortar is only to distribute the pressure, tempered clay or puddle would be a perfectly good material with which to fill the joints and beds, *if it were not for the action of frost;* and in countries where there is no frost the masons do not understand our insistence on clean sand. In walls of the class in question the mortar is of more importance than in close-jointed work; and though it is well to insist in all cases in these countries on clean sharp sand, it is specially imperative here, because if this is not attended to the work will not only be bad but it will proclaim itself so to everybody, by the rough-cast scaling off (the sand in the rough-cast must also be clean). It is to provide against the action of frost on soil injuring the building that a trench is sunk in clay to enable the wall to be commenced about 2ft. beneath the surface. The action of frost on a considerable mass of soil, affecting it throughout, is different from its action at the surface of stone.

This kind of walling (in which the mortar is of great importance), when built with good coarse cement-mortar, in wide joints, is very reliable for important works. I call it built concrete. Care should be taken to have the stones clean, if possible with freshly-fractured surfaces, so that the cement will stick to them. Thin walls in cement-mortar may be built in this way equal to concrete walls, and cheaper, because the expense of the moulds is saved and the stones effect a saving in concrete. Good bricks cost about £4 a thousand in this locality, and concrete walls of this kind to separate the bedrooms will be cheaper than brick walls. Suppose that there is no difficulty about the foundation in respect of the soil; that trenches are sunk about 2ft. deep, and made fairly level and of the proper width in the bottom (remember the walls are of no great height): commence by laying a course of good large stones, mostly headers, on the soil (the footing shown is rather wide) to form a course 2ft. 6in. wide. This course should be faced and levelled up in mortar masonry to be about 14in. deep, and in finishing it regard is to be had to the fact that the wall which rests upon it will be taken in 6in. each side, leaving offsets. The setting-out is now carefully checked; if the corners are to be right angles, the "square" should be checked by measuring the diagonals to see if they are equal. Quoins are now set up, and the

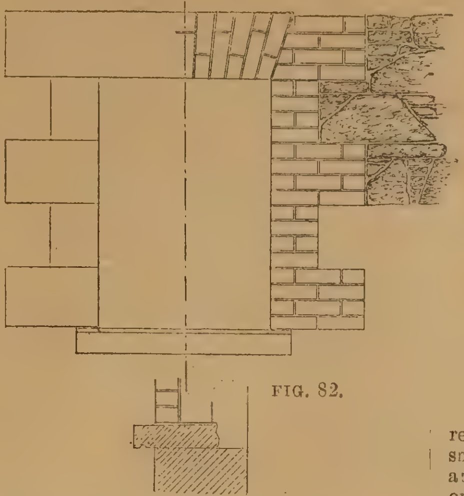

FIG. 82.

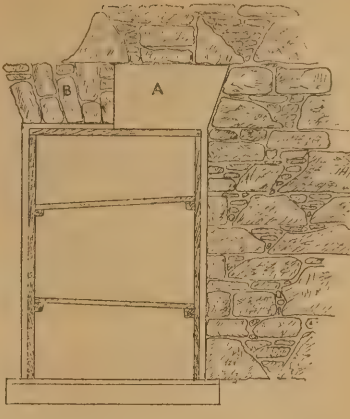

FIG. 83.

first course on the top of the footing course is commenced. It is a good general rule to lay the stones with their largest flat surfaces down on the top of the course below. With stones which show "natural bedding"—that is, which show the layers in which they have been geologically deposited—these largest surfaces will be "natural beds" for any stones. This is the strong way of building. The mason should dress a large stone so as to get two faces as nearly as possible at right angles to one another. The smaller he calls the "*face*," the larger he calls the "*bed*"; and he sets the stone on its *bed* with its *face* to show in the wall. He sets it, having regard to the work in the course below, so as to "break joint"—that is, to bond—and this question of bonding both has to do with the wall lengthwise and across. The spaces between the large stones are filled up with closers and the whole course levelled up to a uniform height, the interspaces between the stones being well filled in with mortar. An 18in. wall is quite thick enough for these houses; if masons are not well looked after they will build thicker than this, and they serve no good purpose by doing so.

With good stones the ordinary quoins may be managed in hammer-dressed work, but dressings for reveals of doors and windows are a very different matter. To be satisfactory these must either (*a*) be worked—chisel dressed; (*b*) be built in brickwork; or (*c*) be worked in concrete. Worked stone is expensive, and it is usual to build such reveals either in brickwork or in concrete.

Fig. 82 shows the usual plat-band arch and dressings in brickwork. I shall later have an opportunity of dealing with brickwork. I intend this house to be an all stonework house, and these brick dressings are merely referred to in passing.

These articles are, I hope, read by workmen who may continue, whether as workmen or foremen, to be every day of their lives employed on works. My own sympathies are with the actual working man. Some hard-and-fast rules of the societies occur to me here. Talking to a friend who is in the building trade, some time ago, he told me that at a job which he had in hand thirty miles away it was necessary to do a trifling piece of masonry (setting two steps, I think), and the rules of the societies compelled him to send a mason these thirty miles to do this one hour's work, though he had bricklayers on the job who could do it quite as well. In a job of the kind before us, would a bricklayer, by society rules, be kept hanging around to build these brick dressings? The designer of a building has at every step to "count the cost," and he requires to have knowledge of matters of this kind. The workmen have quite as much right as, say, the owners of diamond mines to "regulate their output" and to make any rules they think fit. The men with whom there is immediate friction are their employers, who are miscalled capitalists; the people who are really concerned as against the workmen are the consumers, and the consumer is largely the workman himself. Hard-and-fast rules like that referred to are unworkable. I object as strongly as anybody can to what are called "handy men"—"Jacks of all trades"—but be it remembered that to be a good foreman the man must have a touch of the Jack-of-all-trades in him; there must be some reasonable elasticity in "union" rules. I have mentioned regulation of output. I have no hesitation in saying that any regulation of output which involves dawdling at work is vicious—it is bad for the men. Having had experience of what working with my hands for ten hours a day for weekly wages means, I am of opinion that a reasonably educated man cannot live and mentally thrive under such conditions. I think shortening of working hours is, in a double sense, a question of time. But let it be understood that the opposing things are not *capital* and *labour;* the working man's capital is his labour, and the capitalist's capital is the accumulated results of labour of which the capitalist happens to have control. The workman very properly takes every means to enhance the money value of his labour. When he succeeds in doing so, he, as a rule (there are exceptions), increases the value of the capitalist's accumulations. When the value of labour has increased all round the employer who is clever in organizing and managing makes more money, because, assuming that the volume of business remains the same, he has his percentage of profit on a larger cost. The opposing elements are the producers and the consumers; and producers have to take into account the possibility of their being undersold by producers outside their unions, and possibly foreigners. The working man is a powerful voting element, but every householder is a consumer: let there be sweet reasonableness all round. The question is made complex by the existence of capital such as land, coal beds, &c., in the possession of individuals, and by the existence of monopolies as certain railways, where, if a larger proportion of the earnings is paid in wages, there is a smaller share for dividends; but, after all, it is a comparatively simple department of the "dismal science."

Fig. 83 shows how I would work these reveals and lintels, employing moulds and using cement-mortar. The lintel may either be of concrete formed in a mould, and the surface finished smooth, as at A; or, if the stones are suitable, it may be built in cement-mortar as at B. As the wall is to be finished in rough-cast, small stones in such places, as giving by their joints better hold, are rather an advantage. If sashes such as I shall describe are used (balanced one against the other), there is no objection to the window-frames being set up on the stone sills and the reveals built up to them; in this case the moulds for reveals are of a very elementary description. Some cement-mortar may be usefully employed at the quoins when the stone is not of a kind to give good hammer-dressed quoins, or the quoins may be purchased.

It is usual to place wood-lintels in the soffit of the splays of the windows; and a common rule is to give such lintels 1in. of thickness for each 1ft. of span. It is quite a common error to give them too much wall-hold. I avoid the building of timber in walls in every reasonable way. In dealing with more important buildings lintels will be dealt with in further detail; and relieving arches shall be described. In this small house I place a piece of timber 2in. thick, and broad enough to form the soffit of the door or window, and the edge to be flush with the surface of the plaster; and I have it planed smooth on the under-surface so as to be fit for either painting or varnishing. It need have no more than 1in. or 2in. of wall-hold; a few rough spikes are driven into its upper surface to take hold in the concrete, and 9in. deep of concrete is placed to form a concrete lintel over it. It may be necessary to prop this lintel in the centre while the concrete is setting. As I have said that this is to be an all-masonry house, the flues and chimney-stack need special treatment. The chimney breasts may be worked, if necessary using simple moulds and cement-mortar, in ways like those described for reveals, and the openings gathered to the flues. The flues may either be worked round drums (Fig. 84), using either cement-mortar or good common mortar; or fireclay flue-linings (Fig. 85) may be built in as the masonry is carried up. The chimney-stacks will, in any case, require to be formed in moulded concrete so as to be of convenient outside dimensions. The drawing does not show chimney-pots; flue-linings, projecting say 9in. over the top of the stack, will form a useful addition. In working with drums the mortar must not be allowed to set too hard round the drum. After the proper interval the drum is gently twisted by the handle and raised up for a new course.

The student who meets with any technical terms which he does not understand is one who needs to talk to working men and to examine work in progress.

(*To be continued.*)

The New District Church of St. Augustine of Canterbury at Margate, which has been built from the designs of Mr. Dalby Reeve, of Margate, was consecrated recently. It is of brick, with Bath-stone dressings, has cost £5,000, and consists of nave and aisles, to which it is intended to add an apsidal chancel at a further cost of £2,000.

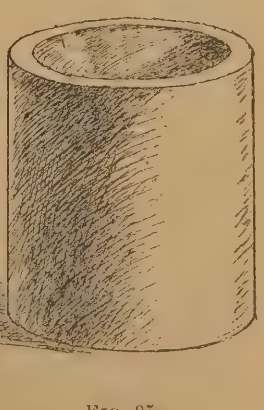

FIG. 85

Builders' Notes.

Dinorwic Slate Quarries.—The Hon. W. W. Vivian, who has for many years held the post of general manager of the Dinorwic Slate Quarries, Carnarvonshire, will retire from that position on January 1st.

Record Building.—All the entire steel framework of a fifteen-storey office-building has just been erected at 68, William Street, New York, in twenty-five days. On November 9th the old building occupying the site was removed and the ground cleared. A huge steel skeleton was then erected, and is now ready for the stone and brickwork. The building will be fully completed in six weeks.

A Prize for Builders.—A Challenge Casket is being competed for under novel circumstances. With the object of hastening on the completion of the Wolverhampton Exhibition buildings now being erected, Mr. Thomas Graham, J.P., chairman of the Executive Committee, hit upon the happy idea of presenting it for competition. It will become the property of the builder who first completes his contract. The casket has been designed and executed at the Wolverhampton School of Art. The accepted design was that of Mr. J. E. Wootton, who competed along with nine other students, and was awarded the first prize of £3 3s. The casket is of silver, and of the value of one hundred guineas. It has enamelled panels containing figures emblematic of the builder's craft, relieved with precious stones, and surmounted by two figures representing "Success." It is 14in. long and 7in. high.

Dissolution of Partnership.—The partnership existing between Messrs. Thomas Gregory & George Cattell Hudson, carrying on business as builders and contractors and woodpaving manufacturers, at Station Works, Clapham Junction, S.W., under the style or firm of Thomas Gregory & Co., has been dissolved by mutual consent as and from December 7th. All debts due to and owing by the late firm will be received and paid by Mr. George Cattell Hudson at the temporary office of the late firm, 11, Andoe Road (adjoining the old works), Clapham Junction, S.W. Mr. Gregory having retired and their old premises having been acquired by the London and South Western Railway Company under statutory powers, Mr. Hudson has decided to join his business with that of his brother at 207, St. John's Hill, Clapham Junction, S.W. The future name of the firm will be Hudson Bros.

Masters and Men.

Barrow Joiners.—The following is the text of the umpires' award in connection with the recent dispute: "That, in accordance with local custom and precedent, and the general practice in other parts of the country where similar work has been performed, Messrs. Gradwell & Co., Ltd., are at liberty to employ shipwrights and handymen and joiners to do the work connected with the repairs to the wharf at Ramsden Dock, and that the work does not devolve exclusively on the joiners."

The Bradford Strike and the City Council.—Fair contracts were considered by the Bradford City Council on December 10th. The strike in the Bradford building trade still drags on wearily, the places of the union men are being filled, and contracts are proceeding. Various attempts have been made to draw the Corporation on to the side of the workmen as against the contractors having Corporation contracts, but so far without success. A resolution was moved that the committees should ascertain whether the workmen engaged on Corporation contracts were receiving the standard rate of wages, and if not, contractors should be required to do so, failing which the penalty clauses of the respective contracts should be enforced forthwith. A letter was read from Messrs. Neill & Holland, solicitors to Bradford branch of the Builders' Federation, saying that the passing of such a resolution would only cause further irritation in connection with the strike. They would also have to advise their clients to take no notice of the resolution if passed, and, if necessary, to fight in the law courts. The question also came up on the minutes of the Finance and General Purposes Committee, where there was a resolution for the appointment of a sub-committee to consider the proper clauses to be inserted in the "fair contract" to secure its observance and to define the term "standard rate of wages." It was decided to obtain the opinion of two counsel as to the position of the Council in relation to the fair-contracts clause. After this, the first resolution was discussed. The standard rate of wages, it was stated, had been departed from. For instance, in the Conditioning House contract, which was let on the 13th of August, 1900, the rate of wages for masons was 9½d. and for joiners 9d.; whereas the rates offered now were—for masons 9d., and joiners 8½d. The same also held good in relation to the contracts for the new fire station, the Manningham car depôt, and the electricity station works. It was pointed out that in the case of the Cartwright Memorial Hall the contract was let when masons were paid 8¾d. Since then the contractor had paid 9½d., and was still willing to pay 9d. The original resolution was finally carried.

Engineering Notes.

The New Bow Bridge is about to be erected by the L.C.C. in conjunction with the Essex authorities. It is proposed that the new bridge shall be 70ft. in width, with a headway in the centre of the span of 8ft. 7in. above Trinity high-water level, or 2ft. higher than the present bridge.

The Electric Tramway Service at Grimsby was opened recently. The system is owned by the Provincial Tramways Company, and the motor-power for the system in the borough is derived from the Corporation works; whilst that for the line from Grimsby to Cleethorpes is supplied by the company's own station. The running powers have been leased from the Corporation for twenty-one years, at an aggregate rental of £30,000.

Electric Street Railway Construction.—A meeting of the Institution of Junior Engineers was held on December 6th, the chairman, Mr. Percival Marshall, presiding. A paper on "Street Railway Construction for Electric Traction" was read by Mr. F. S. Pilling (member), of Devonport. Reference was made to the arrangement of termini as affecting the car mileage, and to the mistake often committed of constructing double junctions between main and branch lines with no provision on the main line at the junction for transferring a car from one line to the other, with the result that when the cars were being distributed in the morning and returning in the evening they frequently have a profitless run of perhaps 300 or 400 yards to the nearest cross-over in order to be transferred to the right line outwards or inwards. The objections to constant radius curves were dwelt upon and the writer showed that the application of railway practice to permanent way construction for tramways on public highways was a mistake. In considering the construction of the track the difficulty was to make and maintain it in an absolutely rigid condition. The weakness arose in the jointing of the rails, the most satisfactory type of which at present to meet British requirements was the girder with a weight of not less 90lbs. per yard. Sole plates were not commended. The adoption of a deeper rail section with a very much wider sole than is usually employed, together with the use of deep-ribbed fish-plates secured by means of six pairs of bolts, would probably be found advantageous; the bonds taking the form of copper rivets of large area, compressed into holes drilled through both plates and the web of the rail. Reference was made to the Falk system of cast-weld solid jointing, it being stated that the joint produced was an expensive one and liable to fracture, though the percentage of failures was claimed to be extremely low. In rail-laying good bonding was very important. In conclusion the best materials to employ in the laying of the paving were considered, the use of all kinds of wood-block paving being regarded as unsuitable.

American Bridge-Builders Beaten.—Messrs. Head, Wrighton & Co., Ltd., the well-known Stockton bridge-builders, have, despite the keen competition of their American rivals, secured a large order for bridge work for South Africa. The order included six 100ft. spans to build three separate bridges, and is from the Natal Government. The utmost expedition has had to be displayed in carrying out the work, and already a portion of the contract has been shipped. The firm has also secured the contract for the erection of the Kingston bridge, near Staines, for the London and South-Western Railway Co.

The Engineering Trade.—The rearrangement of the working agreement in the engineering trade which was made at a conference of the Federation of Employers and the Amalgamated Society of Engineers held in London recently is now being submitted to the operatives for approval. The agreement is that which was drawn up at the close of the great strike a few years ago. It has worked exceedingly well, especially the provisions for avoiding and settling disputes; and since it came into operation there has been scarcely any stoppages of work in the trade. The alterations made at the recent conference were in matters of detail only, and the agreement is still practically what it has always been. The conference was amicable in every way, and the revised agreement is almost certain to be accepted by the men. It has already been accepted on behalf of the employers.

The Society of Engineers held its forty-eighth annual general meeting on December 9th. The chair was occupied by Mr. Charles Mason, president. The following gentlemen were duly elected by ballot as the council and officers for 1902, viz.:—As President, Mr. Percy Griffith; as vice-presidents, Messrs. James Patten Barber, David Butler Butler, and Nicholas James West; as ordinary members of council, Messrs. Joseph Bernays, G. A. Pryce Cuxson, George A. Goodwin, W. H. Holttum, R. St. George Moore, Henry Sherley-Price, Joseph W. Wilson and Maurice Wilson; as hon. secretary and treasurer, Mr. George Burt; as hon. auditor, Mr. Samuel Wood, F.C.A. The following premiums, it was announced, had been awarded by the Council for papers read during the past session, viz.:—The President's Gold Medal to Mr. H. Alfred Roechling for his paper on "The Sewage Question during the Last Century"; the Bessemer premium of books to Mr. Roger G. Hetherington for his paper on "The Main Drainage of Ilford"; a Society's premium of books to Mr. Arthur T. Allen for his paper on "Concrete Subways for Underground Pipes"; a Society's premium of books to Mr. Sydney A. Hollis for his paper on "Preliminary Investigations for Water Supply;" and a Society's premium of books to Mr. J. Freebairn Stow for his paper on "Irrigation Works in South Africa."

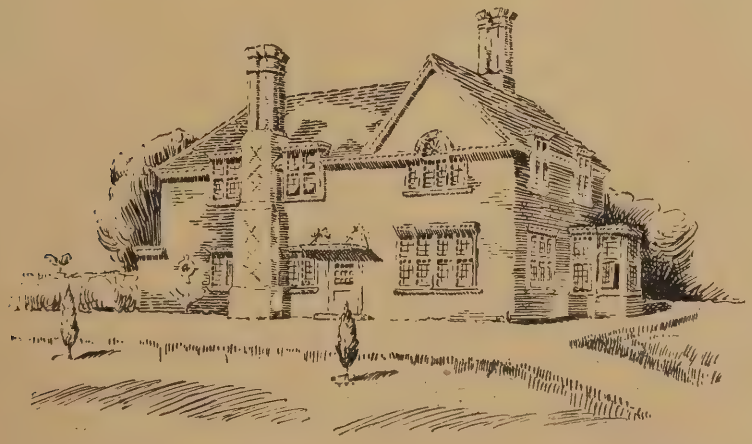
Electric Traction on the Underground Railway.—Mr. Lyttelton, the arbitrator appointed by the Board of Trade, has decided in favour of the scheme proposed by the Metropolitan District Railway Co., known as the "continuous"-current system of electric traction, for the Inner Circle. The "continuous" system, whereby an alternating current of high tension is first transformed and then converted into a direct current of 500 volts, and collected from a third rail into the train motors, is very well known, and it was not seriously questioned by the Metropolitan Company that it had been proved to satisfy the requisites by long and well-tried experience on similar railroads, carrying similar traffic, under similar conditions, both in America and England. The "alternating" system, as carried out by Ganz & Co., of Budapest, proposed by the Metropolitan Company, abolishes the rotary converters employed in the continuous system and introduces into the tunnels where the trains run a current of 3,000 volts carried on overhead conductors and collected thence into the train motors by trollies. Mr. Yerkes has awarded the contract therefore to the Western House Electric and Manufacturing Co., of Pittsburg. The greater part of the work will be undertaken at the company's works at Manchester. The Metropolitan electric generating station will have a minimum capacity of 70,000-h.p., and a maximum of 100,000-h.p. The work will be begun immediately; and within two years from January 1st, 1902, the alterations will be finished.

Surveying and Sanitary Notes.

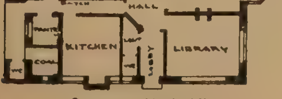
Ecclesiastical Surveyors and Dilapidations.—In the twenty-ninth report of the Ecclesiastical Surveyors' Association allusion is made to the law and practice of dilapidations. At the request of the Practice Committee of the Royal Institute of British Architects they had furnished a report on ecclesiastical dilapidations to be embodied in the new book on dilapidations to be issued by the Institute. It is probable, says the report, that the present Convocations and Parliament will ultimately discover, like their predecessors, that the clergy are most advantageously dealt with under the existing Act, as compared with any other tenants, and that no serious alteration of the law is needed or even possible.

The Condition of the Streets.—The Corporation of London are prosecuting a Bill in Parliament next session to empower them to regulate and control the opening or breaking up of streets in the City by authorities, undertakers, and other persons having statutory or special powers in or over such streets. The number of such authorities and undertakers has of late largely increased, and their powers are capable of being exercised separately and independently of each other. The Bill provides for notices being required of not less than three months before the opening of any streets, together with plans and sections, and for publication of the notices in the thoroughfares affected; for power to the Corporation to prescribe the sequence in which streets may be opened, and the conditions under which the work may be performed; and for prohibiting the reopening of an street for a period of nine months from the completion of any previous work in it without consent of the Corporation or except in cases of emergency. Penalties for infringement are suggested, and there is power of arbitration by the Board of Trade in questions of disagreement between the Corporation and the undertakers.

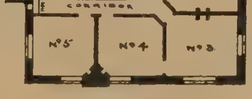
The Roads Improvement Association has addressed to the President of the Local Government Board a memorandum setting out a number of reforms in the existing system of highway administration which, if adopted, the Association considers would go a long way to abate the congestion of traffic and of population in urban districts and to restore prosperity to the rural districts. It is first suggested that there should be created a separate Highway Commission, or a new department of the Local Government Board, as a supreme road authority to advise and supervise local authorities in all matters relating to roads, with power to take action in all cases where local authorities neglect their highway duties. This Commission should also be entrusted with powers to administer Government grants in aid of the maintenance of existing and the construction of new main roads of national importance; to classify main roads; to make regulations as to the offices of road surveyors and municipal and county engineers; to report to Parliament on all tramway schemes; to report to the Board of Trade on light railway schemes affecting public roads; to make regulations as to the width and the methods of construction of roads; to ascertain by experiment the best and most economical methods of maintenance and repair; and to make an annual report to Parliament on the construction and maintenance of roads in England and Wales. It is further suggested in accordance with the recommendations of the Royal Commission on Local Taxation, that one-half of the cost of the maintenance of main roads in England and Wales should be met out of Imperial taxation, the grant to be payable only when the local authority has obtained a certificate from the Highway Commissioners that its roads have been maintained to their satisfaction, and in the case of urban districts and non-county boroughs only when they hand their roads over to the county authority. Other proposals made in the memorandum are that the Highway Commissioners should have power to exempt, on due cause being shown, a local authority from the operation of section 92 of the Lands Clauses Act for the purpose, for example, of enabling a local authority to take a part of the front gardens of a row of houses for a street-widening without having to buy the entire property. With regard to the proposal for the creation of highway authorities over large areas, it is suggested that such authorities should have power to vary and determine the direction of all new streets, and should be required to draw up schemes for the development of their districts, and it is contended that this would have the effect of placing some limit on the enormous expenditure now incurred in street-widenings and improvements and the removal of insanitary areas. Although this expenditure is due to the fact that in the last century property owners and speculative builders were allowed to plan out their estates pretty much as they pleased, building operations are still allowed to be carried on in the suburbs of large towns in the same ill-regulated way, and the inevitable result will be that in the future further large sums will have to be spent.



ENTRANCE FRONT



GROUND FLOOR PLAN



FIRST FLOOR

J HOOPER MAY, ARCHITECT.

Keystones.

New Science Buildings at Watford School have been erected at a cost of £2,000.

A New Asylum is to be erected for the county borough of Newport at Caerleon. The architect is Mr. A. J. Wood.

A Memorial Stained-Glass Window to the late Mr. H. W. Cripps, Q.C., Recorder of Lichfield and Chancellor of the Diocese of Oxford, has been placed in the church of St. John, Frieth, Bucks, on the northern side of the nave.

The New Parish Hall of St. Simon's, Plymouth, has been opened by the Bishop of Exeter. Mr. Ambrose Andrews, of Plymouth, was the builder; and the architect is Mr. Harbottle Reed, of Exeter.

A New Organ at Hawarden Church has been dedicated, and also a churchyard memorial cross on which are engraved the names of six Hawarden Volunteers who have died in the war in South Africa.

A New Infants' School at Dewsbury has been erected in Boothroyd Lane by the Dewsbury School Board at a cost, including half the land (the other half belonged to the Board), of £5,072. The architect is Mr. F. W. Ridgway, F.R.I.B.A.

Design for a House.—The house by Mr. J. Hooper May illustrated on this page is to be built of purple Petersfield brick walls with red brick dressings, rough-cast gables distempered white, and the roof covered with old tiles, all external woodwork being painted white.

At the Old Parish Church at Newbury, dedicated to St. Nicholas, a new stained-glass window has been inserted in the south clearstory by the St. Nicholas Stained Glass Window Society, in continuance of the series which have gradually embellished the church during the past quarter of a century.

A New Empire Palace of Varieties at Hackney has been erected in Mare Street. The general scheme of colouring is cream and grey blues, relieved by draperies in deep Rose Dubarry, with a similar colouring of the walls; and the auditorium is upholstered in embossed deep-rose plush. The stage, 60ft. wide and 40ft. deep, is fitted with all the latest mechanical effects, the lighting throughout being electric. The auditorium, 76ft. from stage front to pit back, with a width of some 80ft, is claimed to be the largest in the Metropolis.

In Pulling Down the Nave of St. Mary Parish Church, Chatham, for the purpose of rebuilding, some beautiful old Norman arches in the west wall have been brought to light. The work has been temporarily stopped in order that a special fund may be raised to preserve these and other remains of the old Norman church. From the resemblance of the work to portions of Rochester Cathedral it is believed it dates back to the twelfth century, and evidence exists that the Norman church of which it formed part remained standing until the second half of the eighteenth century.

Japanese Drawing.—The Japan Society of London held a meeting last week, when a paper was read by Mr. Charles Holme, the Society's hon secretary, on "Some Aspects of the Technique of Japanese Drawing," illustrated by drawings and paintings cleverly done on the spot by a Japanese artist—Mr. S. Kado, of Kioto. Mr. Holme dealt with the paper and other materials on which the Japanese artists worked, the pigments they used, and particularly with their brushes and the varied ways of handling them. The native writing was a product of the brush, a circumstance which largely accounted for the characteristics of the native drawing and painting by the same means. He also described the principal schools of Japanese art, such as the earlier Buddhist school, which in its character was distinctly Indian; the Kano school, which improved on Chinese methods, and had many divisions; the Shijo school, of the naturalistic order; and the Tosa school, whose work was akin to our illuminations of the Middle Ages. The styles of those leading schools Mr. Kado showed in succession by his rapid and effective sketches, both in black-and-white and in colours.

St. Michael's Church Tower, Bristol, is to be restored. The architect is Mr. W. B. Gough, and the estimated cost £1,200.

In Norwich Cathedral a stained-glass window has been placed in the north-east aisle to the memory of the Ven. Henry Ralph Nevill, Archdeacon of Norfolk from 1874 to 1900, and Canon of Norwich from 1873.

A New Unitarian Chapel at Merthyr is being erected in Thomas Street. It is of Late Gothic design, and is to be constructed of bricks with Bath stone dressings. It provides accommodation for about 150 worshippers, and there is a schoolroom underneath, the total cost of the building, including the site, being about £2,000. The architect is Mr. E. A. Johnson, F.R.I.B.A. The contract for the erection was first taken by Mr. John Jones, Glanynant, and upon his death it was transferred to Mr. Edward Lumley, who is at present carrying it out.

A New Women's and Children's Hospital in Leeds is being erected from designs by Messrs. Chorley, Connon & Chorley, of Leeds, with Mr. A. Graham, of London, as consulting architect. The building will be divided into three departments—the out-patients' block, the hospital block and the administrative block. The out-patients' department is planned entirely on the ground floor, and will be quite independent of the hospital proper. The communication will be for the convenience of the staff only. The hospital proper is on four floors. The basement will be used for storage purposes, and on the ground floor there will be a large entrance-hall, board-room, secretary's office, waiting-room, porter's room and other rooms. The whole cost will be about £24,000.

Artistic Signboards.—M. Detaille, the famous military painter, has called the attention of the Prefect of Police to the poor condition into which everything of the nature of a signboard in Paris has fallen, and besought his influence in elevating the artistic character of these ensigns. He has proposed to M. Lépine to hold a competition for shop signs. Of course, Detaille will enter the lists, and several of his fellow Academicians have promised to compete. Great men of the past have painted signboards—to mention two, Morland and David Cox—and today there is no reason why artists of talent should not replace with works of art the impossible animals and figures of signboards that offend the eye both in country and in town. M. Detaille's scheme does not embrace the art of the painter only, sculptors and metal-workers of all kinds may join the competition.

St. Mary's Church, West Malling, has been restored and enlarged. The alterations have been very comprehensive, so far as the body of the church is concerned. The whole of the nave, with the exception of a portion of the east and north walls, has been rebuilt with the north and south aisles, and in the reconstruction an extra width of some 15ft. has been provided. Practically the whole of the fabric of the whole of the earlier church in the Italian style, built about 100 years ago, has been replaced, what Norman work there was being retained in the chancel and tower. The work, which has entailed an expenditure of over £5,000, has been performed by Messrs. Wallis & Sons, of Maidstone, to the designs of Mr. J. T. Micklethwaite, F.S.A., of Westminster Abbey. The rebuilding of the organ was entrusted to Mr. Walmsley, of Maidstone.

A New Boardroom at St. Peter's Hospital, Bristol, for the use of the guardians of the Bristol Union, has been opened. New buildings have been erected at the west end portion of St. Peter's, without interfering with the ancient frontage of the hospital. The architect is Mr. W. S. Skinner, of Edinburgh Chambers, Baldwin Street, Bristol. The alterations have not involved the destruction of any part of the building of any antiquarian or architectural interest, and the unique front elevation has been retained, and also the existing court-room and all the rest of the interior which is of any antiquarian interest. At the same time a new boardroom of suitable dimensions, and other much needed accommodation for the guardians, for the staff, and for the poor applying for relief have been added. Messrs. Stephens, Bastow & Co., Ltd., of Bath Buildings, Bristol, were the builders, and the cost has been about £7,000.

The Architectural Details of Mr. Tree's "Ulysses"—more especially the details of the Homeric house—are, we understand, being designed by Mr. W. R. Lethaby.

A Cold Storage Warehouse at Old Wynd, Glasgow, is to be erected for Mr. William Milne at a cost of about £10,000 for mason and brickwork, steel and cast-iron work, wrought and plumber work alone, exclusive of concrete and granite work. Mr. Alexander Adam, of 212, St. Vincent Street, Glasgow, is the architect.

A New Town Hall and Public Offices at Ilford have been opened in High Road. Mr. B. Woollard, A.R.I.B.A., is the architect. The style is free Classic. The large hall is 76ft. long and 57ft. wide, with an extensive platform and a gallery. The seating accommodation is for 1,000 persons. The cost has been about £30,000.

The Pinnacles and Battlements of the Old Tower of Okehampton Church have been taken down and re-fixed, under the superintendence of Mr. G. H. Fellowes Prynne, architect, of London, as they were considered to be in a dangerous state. A new lightning conductor has also been fixed by Messrs. Hearder & Son, of Plymouth; and Messrs. Aggett & Son, of Chagford, have rehung the bells.

Workshops used as Sleeping Places.—An order has been issued by the Home Secretary under sub-section (3) of section 3 of the Factory and Workshop Act, 1901, to the effect that where a workshop other than a domestic workshop is occupied by day as a workshop and by night as sleeping place, the proportion of cubic feet of space shall not be less than 400ft. to each person employed.

A Statue in Bronze of Vercingétorix has just been completed by Bartholdi. It is now thirty years since the sculptor first conceived the model of this fine work, which represents the heroic Gaul mounted on horseback, with arm raised and sword in hand, evidently in the act of mowing down the invading hordes of Cæsar. The statue is to be erected near Clermont, which is supposed to be the field of the vast struggle between the hero of Averne and the victorious Roman. According to some writers Vercingétorix was besieged in Alésia and forced to surrender. After having adorned the triumph of the conqueror he was strangled in 47 B.C.

The T-Square Club.—Mr. F. W. Pomeroy presided over the monthly "smoker" of this club in the Throne Room, Holborn Restaurant, on Wednesday evening last. The attendance was large and the programme excellent. Messrs. H. Holyoake, S. Spurcell Groom and Wilfred Stracey contributed songs, and Messrs. Graham and Russell gave musical duets. Selections on silver bells were given by Mr. R. B Hopkins, and the violin solos of Mr. John Saunders were much appreciated. The attractions of the evening were, however, the story telling of Mr. G. H. Snazelle, who had just returned from a lengthy tour in Australia, and the marionette sketches by Mr. Walter Graham. The latter were quite a novelty. Mr. Alfred Smythson acted as pianist. During the evening a collection was made on behalf of the "Referee" Children's Dinner Fund, and about £8 was realised.

Royal Academy Prizes.—The following are prize winners in this year's Students' Competitions at the Royal Academy:—*Design for the Decoration of a Portion of a Public Building* (£40), Mr. F. S. Eastman; *proxime accessit*, Mr. W. E. G. Solomon. *Composition in Sculpture*, Boadicea urging the Britons to avenge her outraged daughters (Gold Medal and travelling studentship, £200), Mr. S. N. Babb. *Designs in Architecture*, A Town Hall for one of the new London Borough Councils (Gold Medal and travelling studentship, £200), Mr. Bernard H. Webb. *Set of Architectural Drawings*, Trinity House (Silver Medal), 1st, Mr. Charles T. Palmer; 2nd, Mr. P. I. Elton. *Set of Architectural Designs* (Upper School) (Prize £25), Mr. F. W. Newman. *Set of Drawings of an Architectural Design* (Lower School) (Prize £10), Mr. T. G. Davidson. *Plan of a Building*, A casino and pleasure grounds on the borders of a lake (Prize £10), Mr. L. U. Grace. *Perspective Drawing in Outline* (open to architects only), Lord Burlington's Villa at Chiswick (Silver Medal), Mr. A. C. Bossom.

New Companies.

Arley Brick Co., Ltd.

Registered to acquire the business carried on at Arley, in the township of Blackrod, Lancashire, as the Arley Brick Co., Ltd.: and to carry on the business of brickmakers, miners, dealers in clay, sand, iron, brick-earth, metals and minerals, pottery and earthenware manufacturers, &c. Capital £5,000 in £1 shares. The first directors are J. P. Sheridan, C. B. Craven, J. Miller, T. H. Kevill, J. Redhead and G. Heald. Registered office: 26, High Street, Chorley, Lancashire.

Ashford and District Brick and Tile Co., Ltd.

Registered to acquire the brickmaking business of G. F. Davis, with certain premises, stock-in-trade, plant and effects at Beaver, Ashford, Kent, and at Hope-all-Saints, Kent, and to develop and carry on the same and any similar business. Capital £10,000 in £5 shares. The first directors are J. G. Boorman, G. F. Davis, H. L. Diprose and W. F. B. Jemmett (chairman).

Birmingham Colour Co., Ltd.

Registered to acquire the business carried on by W. Magrath, J. W. Magrath and F. Magrath at Montgomery Street, Birmingham, as the Birmingham Colour Company; and to carry on the business of colour, paint and varnish manufacturers, dealers in oil, turpentine, petroleum, spirits, gums and chemicals, &c. Capital £15,000 in £5 shares (2,000 preference). The first directors are W. Magrath, J. W. Magrath and F. Magrath. The two last-named are managing directors. Registered office: Challenge Works, Montgomery Street, Sparkbrook, Birmingham.

Enamelled Copper Letter Co., Ltd.

Registered to carry on the business of enamelled copper letter manufacturers, manufacturers of letters in wood, metal, porcelain, china, glass, crystal and other materials, sign-writers, shop furnishers, woodcarvers, ironmongers, furniture dealers, &c. Capital £1,000 in £1 shares.

Fleetwood Estate, Ltd.

Registered to acquire from the Fleetwood Estate Co., Ltd., the whole of its properties and undertaking; to lay-out land for building purposes; and to carry on the business of builders, decorators, contractors, &c. Capital £120,000 in £1 shares (60,000 five per cent. preference). The first directors are D. Abercrombie, W. Dronsfield, E. N. Galloway and T. G. Lumb. Registered office: 10, Queen's Terrace, Fleetwood.

Jackson (Birkenhead) Estates, Ltd.

Registered to acquire certain freehold and leasehold tenements and hereditaments in Birkenhead, Cheshire (part of the residue of the estate of the late Sir W Jackson, Bart.), and to carry on the business of builders, contractors, merchants, dealers in stone, sand, clay, lime, timber, hardware, cement, bricks, tiles and other building materials, &c. Capital £4,000 in £10 shares. The first directors are W. Jackson, T. H. Jackson, Sir H. M. Jackson, Bart., W. R. P. Jackson, W. B. M. Jackson, G. M. Jackson and W. Jackson, jun. Registered office: 18, James Street, Liverpool.

Kidderminster Landed Investment Co., Ltd.

Registered to acquire any land, messuages, shops, factories, buildings and hereditaments of any tenure or description in the borough of Kidderminster, Worcestershire or elsewhere, and to develop and turn to account any land by preparing building sites, erecting, decorating, furnishing, and maintaining houses, flats, offices, factories, warehouses, shops, wharves, buildings and works, &c. Capital £3,000 in £1 shares. The first directors are W. H. Talbot, W. Chadwick and T. L. Lea (all permanent).

Ormerod, Whitaker & Sons, Ltd.

Registered to carry on in all or any of their respective branches the businesses of slaters, concreters, asphalters and stone merchants, &c. Capital £3,000 in £1 shares. The first directors are O. Whitaker and J. Whitaker. Registered office: Rake Head Mill, Burnley, Lancashire.

Moffat's, Ltd.

Registered to acquire the patent and patent rights, wholly or partially, of an invention known as the Lucas Incandescent Intensive Gas Lamp, and all such rights, privileges and advantages as G. D. Moffatt has with the Allgemeine Belenchtungs und Heiz Industrie Actien, Gesellschaft, of Berlin. Capital £2,000 in £1 shares. The first directors are G. D. Moffatt and S. Francis. Registered office: 33–5, Charterhouse Square, E.C.

Natal Indestructible Brick Co., Ltd.

Registered to acquire any inventions relating to the manufacture and treatment of bricks, building blocks, or artificial stone from a combination of sand or similar material and lime; to adopt an agreement with the Indestructible Brick Syndicate, Ltd.; and to carry on the business of manafacturers of and dealers in bricks, building blocks and materials, artificial stone, &c. Capital £17,000 in £1 shares. The first directors are Baron Victor Barreto, C. Hall and J. S. Sheldrick.

New Birch Tail Co., Ltd.

Registered to acquire the business of tile manufacturers now carried on by William Goosty, and formerly by the Birch Tile Co., Ltd., at Clarence Street, Hanley, Staffordshire; and to carry on the business of tile, placque and slab manufacturers, manufacturers of articles for hearths, grates, walls, ceilings and floors, &c. Capital £5,000 in £1 shares.

Wilson Estate Co., Ltd.

Registered to acquire certain lands, buildings and properties in or near Liverpool belonging to J. Wilson, and to carry on the business of builders, contractors, decorators, stone, sand, lime, brick, timber and hardware merchants, &c. Capital £1,000 in £1 shares. J. Wilson is governing director for life.

TENDERS.

Information from accredited sources should be sent to "The Editor." Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

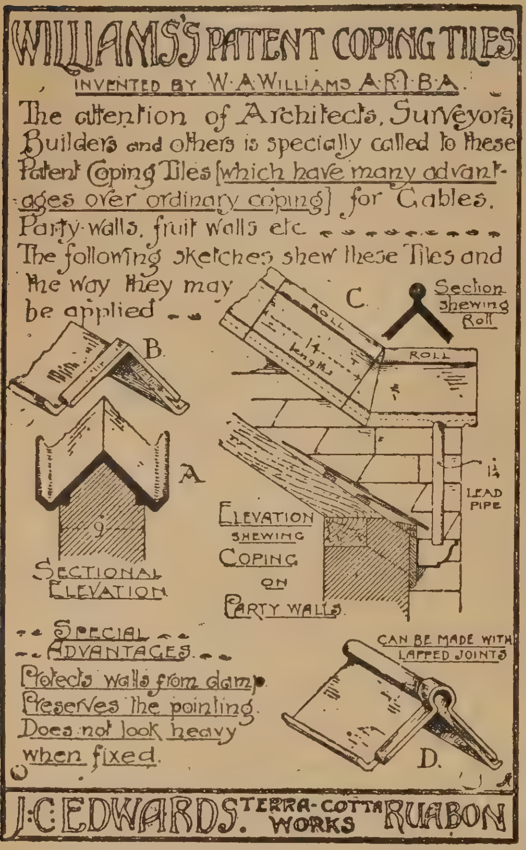
IMPROVED COPING TILE

(PATENTED)

For GABLES, PARTY WALLS, &c.



WILLIAMS'S PATENT COPING TILES.

INVENTED BY W. A. WILLIAMS A.R.I.B.A.

The attention of Architects, Surveyors, Builders and others is specially called to these Patent Coping Tiles (which have many advantages over ordinary coping) for Gables, Party walls, fruit walls etc.

The following sketches shew these Tiles and the way they may be applied

B.
C.
Section shewing Roll
ROLL
ROLL
A
1¼ LEAD PIPE
SECTIONAL ELEVATION
ELEVATION SHEWING COPING ON PARTY WALLS
CAN BE MADE WITH LAPPED JOINTS
D.

SPECIAL ADVANTAGES.

Protects walls from damp.
Preserves the pointing.
Does not look heavy when fixed.

J. C. EDWARDS. TERRA-COTTA WORKS RUABON

This Coping prevents the water collected by it from running down and soaking into the wall beneath.

The end tile is provided with outlets, from which the water can be conducted to the eaves gutter or elsewhere by a small lead pipe, or the outlet holes can be omitted, the tile throated and set to let the water shoot clear of the building, but the pipe is recommended and the expense is trifling.

It can be used as well on the flat, as raking, for with a little care it can always be laid to a slight fall, the outlets then should not be more than 10 feet apart.

The Tiles are set and jointed in cement, the edges being scratched up rough to form a key, making a permanent and water-tight joint.

It will be seen that with these Copings the walls are protected from dampness, pointing preserved, rooms in roof kept dry, and defective flashings and fillets do not cause so much leakage. No other ordinary Coping answers the same purpose.

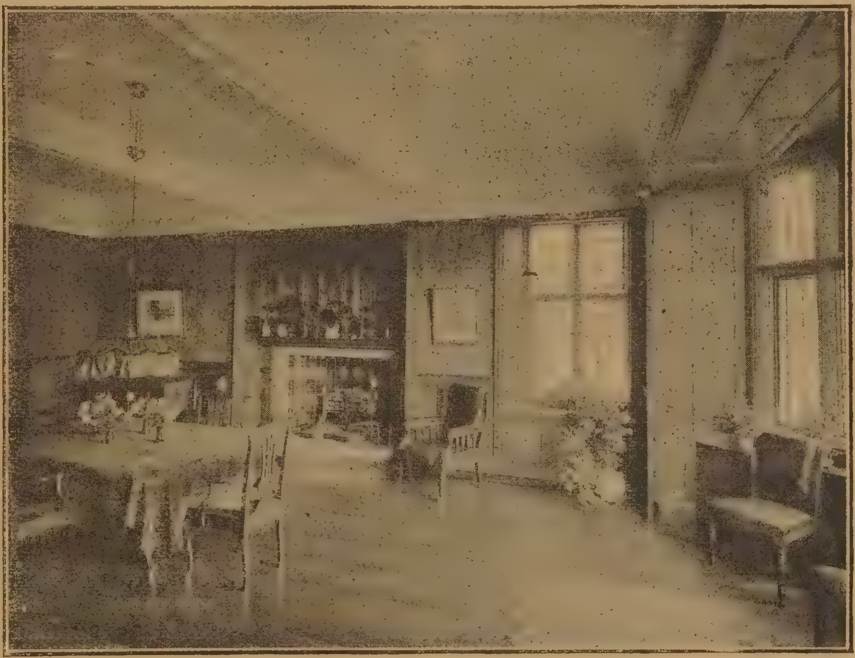
To all our readers—at home and abroad—a Merry Christmas and a Happy New Year.

An Architectural Causerie.

Scrooge: Architect.

MARLEY was dead; to begin with. There is no doubt whatever about that. Marley was as dead as modern Gothic. Mind! I don't mean to say that I know, of my own knowledge, what there is particularly dead about modern Gothic, and if it had been a matter of choice, I should have preferred to say as dead as modern Classic; but this is no matter of concern. Scrooge never painted out old Marley's name. There it stood, on the door-post at the bottom of the stairs; Scrooge & Marley, architects. Sometimes travellers in tiles, or damp-course, or stoneware pipes, called Scrooge Scrooge, and sometimes Marley; but it was all the same to him; and if it had not been for the office-boy (who received five shillings a week and adopted the privileges of a partner) the traveller would never have known of his impropriety. One Christmas Eve old Scrooge sat in his office sullenly turning over the plans of a new house. It was cold, bleak, biting weather, and the fog came pouring in at every chink and keyhole. The door of Scrooge's office was open that he might keep his eye on the draughtsman who, in a dismal little cell beyond, a sort of tank, was just putting the name of Scrooge to a drawing to which he himself could claim the trifling merit of having done it all. But Scrooge paid him well: he paid him twenty-seven shillings a week, and allowed him sixpence for his tea when he remained at the office doing three hours' overtime on a tracing. Scrooge had a very small fire, but the assistant's fire was so very much smaller that it looked like one coal, and when he responded with a "Merry Christmas" to a friend who passed the door, Scrooge said: "Let me hear another sound from *you*, and you'll keep your Christmas by losing your situation": whereupon, the assistant, being meek and docile like all architectural assistants, poked the fire and extinguished the last frail spark for ever. Soon afterwards Scrooge went out, and in a twinkling plans, ink, rulers and pens were out of sight and the office closed.

Scrooge took his melancholy dinner in his usual melancholy tavern, and having read the building papers free of charge, went home to bed. He lived in chambers which had once belonged to his deceased partner—a gloomy suit of rooms. Now, it is a fact that there was nothing at all particular about the knocker on the door, except that it was a very cheap one—like those on houses which are carved at so much a dozen; and it is certain that Scrooge had as little imagination as a member of a Sewerage Board. Yet Scrooge, having his key in the lock of the door, saw in the knocker—Marley's face! To say he was startled would be untrue. But he *did* pause before he shut the door. Then he said, "Pooh, pooh!" and closed it with a bang. He went upstairs and came down satisfied that everything was all right, but as he looked at the Dutch tiles which paved the roomy fireplace there seemed to be on each a copy of old Marley's head. "Humbug!" said Scrooge, and walked across the room. After several turns he sat down again by the fire. As he threw his head back on the chair, his glance happened to rest on a disused bell, which, to his dread, slowly began to swing and ring, and so did all the rest of the bells in the house. Then they ceased and were succeeded by a clanking noise, deep down below. The noise drew closer, closer still, and Marley's Ghost came through the door—the same face, the very same. "What do you want with me?" "Much!"—Marley's voice, no doubt about it. "Do you remember a certain hospital competition?" asked the Ghost. "I do." "And do you recollect how a certain committee went abroad to inspect a hospital there, and how you heard of their intention, and how you got there two days before them and expressed astonishment at meeting them, and how you stayed at the same hotel and smoked the same cigars (their cigars), and how you sent in drawings for the competition, and how remarkably they suited the committee's wishes, and how you won the first premium?" "I do," said Scrooge with bended head. "I am here to warn you that you have yet a chance of escaping my fate. You will be haunted by Three Spirits. Expect the first to-morrow when the bell tolls One." "Couldn't I take them all at once, and have it over?" hinted Scrooge. "Expect the second on the next night at the same hour; the third on the next night when the last stroke of twelve has ceased to vibrate. Look to see me no more, but remember what has passed between us"—with which words the Ghost walked backwards to the window and went out into the night. . . . . . Scrooge awoke. He listened to the quarter, and the half, and the three-quarters; and then the hour bell sounded, dull and melancholy, One. Light flashed up in the room in an instant and an unearthly figure appeared. "Who and what are you," cried Scrooge. "I am the Ghost of the Past." "Long past?" enquired Scrooge. "No. Your Past. Rise! and walk with me!" The Spirit grasped Scrooge by the hand and they walked into the darkness, until a little market-town appeared in the distance. They left the high road, by a well-remembered lane, and soon approached a mansion of dull red brick, a large house, but one of broken fortunes; for the spacious offices were little used, their walls were damp and mossy, their windows broken and their gates decayed. The Spirit touched Scrooge on the arm and pointed to himself. There he was in a long black coat surveying the room with pride. Said he to the two other occupants: "This is a room where some talent has been developed, I believe—we work here, my dear Martin—some architects have been bred in this room—a few, I think, eh, Mr. Pinch? You see some traces of our doings here—Salisbury Cathedral, from the south, a bridge, an almshouse, a jail, a church, a powder magazine—everything for immediate practice. Now let me see how you can employ your time; suppose you give me your idea of a monument to a Lord Mayor of London, or a tomb for a sheriff, or your notion of a cow-house—or a pump is very choice practice. Stay—as you are ambitious, and a very neat draughtsman, you shall try your hand on the proposals for a grammar school. Who knows but that a young man of your taste might hit upon something, impracticable and unlikely in itself, but which I could put into shape—for it is really the finishing touches alone that tell. Perhaps your mind requires to be refreshed by change of occupation—so Thomas Pinch will instruct you in the art of surveying the back garden, or in ascertaining the dead level of the road between this house and the finger-post, or in any other practical and pleasing occupation"—— "Enough, enough!" said Scrooge in a broken voice, "remove me from this place." Scrooge was conscious of being exhausted, and overcome by an irresistible drowsiness; and, further, of being in his own bedroom. He sank into a heavy sleep. . . . . Again the clock awoke him, and he listened. Being prepared for almost anything between a baby and a rhinoceros, he was not by any means prepared for nothing; and consequently, when the bell struck One, and no shape appeared, he was taken with a violent fit of trembling. All this time a beam of light fell on the door knob, and the moment Scrooge touched the latter a strange voice called him, and he went downstairs. There he saw a shape, and cried aloud, "Who are you?" "I am the Ghost of the Present," said the shape; "follow me." Scrooge obeyed the command, and they went out of the house. Walking with alarming rapidity, they soon reached the outskirts of the



DINING-ROOM, DALSTON HALL, CUMBERLAND. J. W. BENWELL, ARCHITECT

UPPER PART OF HALL, DALSTON HALL, CUMBERLAND. J. W. BENWELL, ARCHITECT.

city, where Scrooge saw, huddled together in ghastly array, a street of houses which he had himself designed. This was the first time he had seen them in reality, for, being the architect, he was only concerned with their appearance on paper and had no occasion to inspect them in course of erection. Each was like its neighbour down to the smallest detail; even the handles of the doors were alike, all beautifully punched and scratched so that they afforded a good "key" for the polish which was used to clean them. In front of each house, and hemmed in by cast-iron railings of spiky design, was a garden quite large enough for two men to stand abreast in; and to relieve its vasty space a path had been provided in order that flowers might be culled from the bed. The front door—how felicitous is the human mind!—was so cunningly painted that you could never mistake it for oak, and set over it was a noble porch that received the drippings of the window sills above, that fell on the place beneath. Having pressed a button without effect for several minutes and then resorted to the knocker, the door opened and the visitors found themselves in a hall lighted through the brightest of blue and red glass. They squeezed past a walnut hat-stand (with deal backing) and reached the dining-room. What a sideboard here displayed itself! What saddle-back chairs (with the fringe torn and the castors off)! What gorgeous mantel-piece of fine slate-marble and surmounted by a cast-iron overmantel, just like wood! And what glass in the windows! How wavy! See yet again the wallpaper, whereon storks fly hither and thither, and flamingoes plume themselves in the shade of Renaissance ornament. Pass the door and into the passage once more. Just peep into the drawing-room and thread your way amid the trinket-crowded tables (best Louis XV. on the hire system; solid rosewood—on the front, for the hundredth of an inch). The hearth is here adorned with brass-coated irons which can never be used, and on the piano are grinning Dutch cats made at Hanley and monkeys from Japaningham. But we must hurry to the kitchen—the most truthful room in the house; then upstairs to the bathroom, where, under the influence of soap, the oak comes off in patches; where the water splashes on the paper-mosaic wall, peeling it, and then trickles back into the cast-iron-marble bath. On the floor of the room are imitation tiles of oiled canvas, and on the window imitation stained glass of waxed paper. A jump from the bathroom brings us to a bedroom where there is a fireplace that will undoubtedly hold two coals at one time, and not far away is another room with no fireplace but with a sloping ceiling. How the windows rattle and let in the rain how the wind blows down the chimneys, how the opening of the doors blows the smoke into the rooms, how the water runs down the back garden and collects in pools against the house, how the eaves leak, what little hot water is obtainable, and how awkward it is to carry coal through the hall into the cellar behind the kitchen! Scrooge saw all these things, and a great sadness came over him. Then the Spirit gripped him again, and away they went, passing town-halls from Belgium, clubs from Italy, and other buildings from everywhere, and so in time Scrooge reached his own doorstep, where he sank exhausted . . . . . The bell struck twelve. Scrooge looked about him for the Ghost, and saw it not. As the last stroke ceased to vibrate he remembered Marley's prediction, and lifting his eyes beheld a solemn Phantom, draped and hooded, coming, like a mist, along the ground, towards him. Scrooge bent down upon his knees; for in the very air through which this Spirit moved it seemed to scatter gloom and mystery. "I am in the presence of the Ghost of Yet to Come?" said Scrooge. The Spirit answered not, but pointed downwards with its hand. "You are to show me things that will happen in the time before us, Ghost of the Future! I fear you more than any spectre I have seen." It gave no reply. The hand was pointed straight before them. "Lead on!" said Scrooge. The Phantom moved away as it had come and Scrooge followed. They scarcely seemed to enter the city; for the city rather seemed to spring up about them and to encompass them of its own act. But there they were, in the heart of it. What a different place it was. No roads of earth or wood or asphalt, but roads of iron whereon every imaginable kind of vehicle rushed like an affrighted thing. On separate paths at each side the people went, not walking nor yet running, but supported on wheels which drove them on at terrific speed, some one way, some another. From the iron roadway, which seemed to form the bed of a cañon, great steel buildings stretched themselves high in the air so that no sun could come to the people below, and no rain, for the paths were covered with glass. Rosettes of cast-iron were affixed to this building and cast-iron statues stood on that, while great girders covered enormous sheets of glass which went down to the very pavement. At the edge of each roof, far up in the sky, brackets stretched out gauntly, holding platforms for air-ships, which filled the air above the city and further shielded the streets from the sun. The Phantom motioned Scrooge, and they passed into one of the buildings. Standing in a cage, they descended into the depths, among the tiers of rooms arranged one below the other, all ablaze with light. The cage stopped and they entered a room where a few men were engaged in watching a large number of machines, whose cams and levers and rackwork created a great din; but the men heeded not the noise, as their hearing had become hardened, so that they were not sensible of the note of a singing-bird. The Phantom pointed to a plate on the door, and Scrooge read there: "Electric Plan Factory." He looked at the machines and perceived to his amazement that they drew and measured automatically, delivering plans, drawings, &c., in dozens, ready stamped and rolled. Here was a machine for designing mouldings, another for taking-out quantities, another for checking illicit commissions, and one for making imaginary perspectives. After visiting these rooms the Phantom pointed upwards, and they returned to the street, just below which, in tunnels, many vehicles and human beings rushed along with great speed. Scrooge felt a choking sensation. "Air! give me air," he pleaded, and the Phantom raised him out of the iron chaos into a purer atmosphere. Then he hurriedly took him back, and, almost dead with fright, Scrooge found himself in his bedroom once more . . . Yes! and the bedpost was his own. The bed was his own and the room was his own. Best and happiest of all, the Time was his own, to make amends in! He ran downstairs and laughed. "I don't know what day of the month it is!" said Scrooge. "I don't know how long

BILLIARD-ROOM, DALSTON HALL, CUMBERLAND. J. W. BENWELL, ARCHITECT.

I've been among the Spirits. I don't know anything." Running to the window, he opened it and put out his head. No fog; no mist; golden sunlight. Oh, glorious! "What's to-day, my fine fellow?" said Scrooge to a boy in Sunday clothes. "Why, Christmas Day." "My boy," continued Scrooge, "do you know the poulterer's in the next street?" "I should hope I did," replied the lad. "An intelligent boy," said Scrooge; "a remarkable boy. Go and buy the prize turkey that was hanging up there. Come back with the man, and I'll give you a shilling. Come back with him in less than five minutes, and I'll give you half-a-crown." The boy was off like a shot, and in less than ten minutes the turkey was labelled and sent off to the assistant's, with Mr. Scrooge's best compliments; and Scrooge himself followed soon afterwards. "A merry Christmas," he said, as his assistant opened the door. "I'll raise your salary and help your family, and we'll discuss your affairs this very afternoon over a bowl of smoking bishop. Make up the fires, and buy a new coal-scuttle before you trace another line, Bob Scratching!" R. R. P.

THE HOUSE THAT JERRY BUILT.

THIS is the man for whom it was planned,
And this is the scamp who put it in hand,
And filled in the footings with stones and sand
With no cement, and said, "It's grand!"
When building the house that Jerry built.

These are the bricks, as soft as cheese,
That broke in two if you chanced to sneeze;
Said Jerry: "The man what don't like these,
Lor, blow me! he *will* be 'ard to please;
They'll last for months—unless there's a breeze"
In the beautiful house that Jerry built.

These are the windows of packing-case wood.
Said Jerry: "Of course it's understood
It'll be extra for windows of real wood;
These 'ere are special, and much too good"
To go in the house that Jerry built.

This is the rubbish that blocked up the drain.
Said Jerry: "Now don't you labour in vain;
Fill it in—it'll never be seen again,
It's ten to one he won't complain;
The cellar is meant to collect the rain"
That falls on the house that Jerry built.

This is the elegant panelled door,
With the natural finish left by the saw,
Which warped till its panels fell out on the floor.
He bought it for six shillings—but "Lor!"
Said Jerry, "it looks worth ten bob more"—
Too good for the house that Jerry built.

These are the slates—some small, some great,
Most were crooked but a few were straight,
Each kept in place by the next one's weight;
Said Jerry, instructively, to his mate:
"I saves my nails and I trusts to Fate"
When building the house that Jerry built.

These are the locks he bought for a song,
They work three times and then go wrong.
He said: "It's lucky they ain't too strong;
There'll be some repairs a-coming along"
To be done to the house that Jerry built.

This is the price the purchaser paid
(He'd made some cash in the grocery trade);
"Dirt cheap," said the man of trowel and spade,
As the cheque in his horny hand was laid;
"And a better house has never been made"
For the price of the house that Jerry built.

This is the band that came up the road;
The drummer drummed and the cornet blowed,
And as it passed, the house like a flash
Fell suddenly down with a fearful crash,
And all that remained was a heap of smash;
And the owner said words like "blow" and "dash,"
And he stared in amaze at the heap of dust,
While the more he stared the more he cussed
At the vanished house that Jerry built.

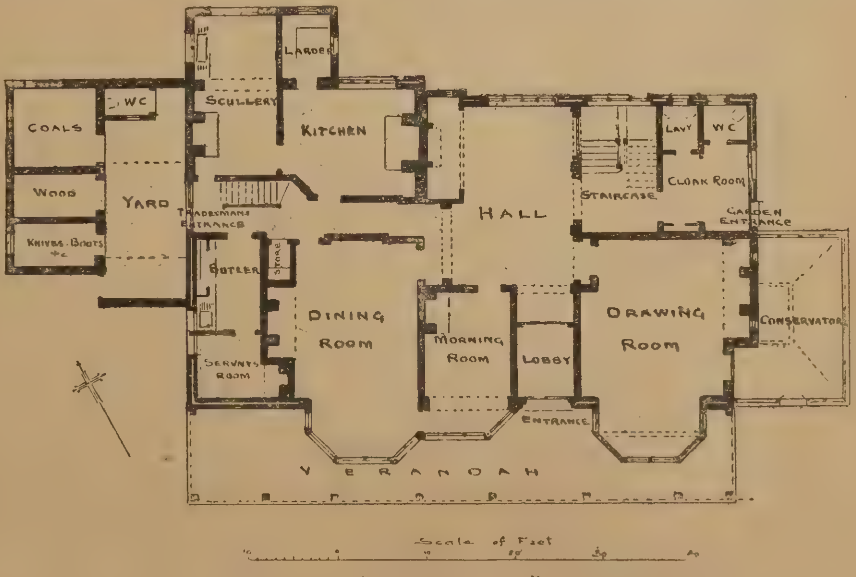
"PARROCK WOOD," HARTFIELD, SUSSEX. CHARLES W. MERRIN, A.R.I.B.A., AND THOMAS R. WAGSTAFFE, F.S.I., ARCHITECTS.

DALSTON HALL, CUMBERLAND.

DALSTON HALL originally consisted of a bell tower, to which additions were made at various times by the Dalston family until it became one of the principal Halls in Cumberland. But it gradually lost its dignity, was used as a farmhouse, and fell into decay. Mr. E. W. Stead became its owner four years ago, and large alterations and additions have been made to it since then. The two towers, with the old work in between, have been untouched as far as possible, but the whole of the interior has been altered to suit the requirements of a modern country-house. The floors to the rooms on the ground floor are all in oak and teak, and the panelling and chimney-pieces are in oak. The floor of the hall (40ft. by 22ft.) is in teak and carried on springs, for dancing. The various contractors have been—for foundations and cellars, Messrs. Beaty Brothers, of Carlisle; general building, Messrs. R. Rathbone & Sons, of Atherton, near Manchester; joiner, Mr. George Black; plasterers, Messrs. Ormerod & Son; plumbers, Messrs. D. Thomson & Sons; slater, Mr. J. Killett; fireproof floors, The Carlisle Fireproof Flooring Co. (all the above of Carlisle); heating, Mr. J. Grundy, of London; range and grates, Messrs. Longden & Co., of Sheffield and London; electric lighting, The "Alliance" (late Veritys), of London. Mr. J. W. Benwell, of Carlisle, was the architect.

"PARROCK WOOD," HARTFIELD, SUSSEX.

THIS house, with stabling for four horses, double coach-house and coachman's rooms, lodge, and other buildings, has been erected for Joseph Titley, Esq. It stands on an elevated site facing south and overlooking Ashdown Forest and the golf links, but it is sheltered from the north and east by a fine belt of trees and rising ground. The south front has a wide verandah extending the whole length of the house, on to which all the principal rooms open. The hall is large, and arranged as a sitting-room with deep ingle. All the passages on the ground and first floors, and the lobby, hall and conservatory, are heated by hot water from the kitchen ranges, without the aid of any separate furnace. The materials employed are, for the lower storey red bricks, and for the upper storey solid pitch pine timbering left rough from the saw, black varnished, with cement rough-cast between, the roofs being covered with dark red tiles. The stables, lodge and other buildings are in keeping. There are also engine- and well-houses, with an oil engine for pumping, saw-driving and electric-lighting. The whole of the drainage is carried to a series of septic tanks at the lower portion of the estate. Mr. J. Luxford, of Forest Row, was the builder; the heating is by Mr. T. Potterton, of Balham. The architects were Mr. C. W. Merrin, A.R.I.B.A. and Mr. T. R. Wagstaffe, F.S.I., of 31, Fenchurch Street, E.C.

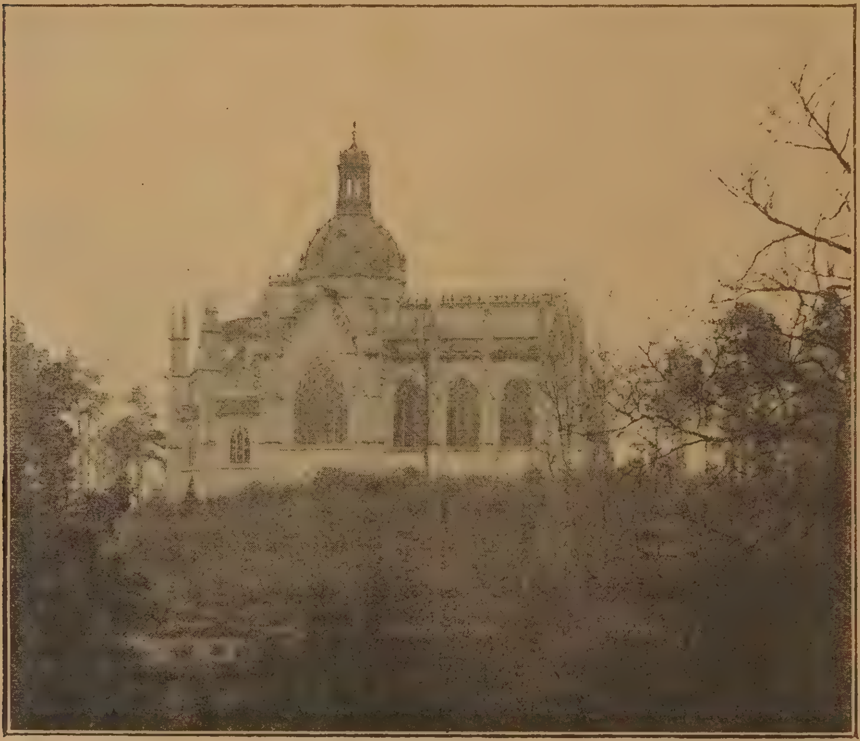


GROUND-FLOOR PLAN OF "PARROCK WOOD," HARTFIELD, SUSSEX.

ST. MICHAEL'S PRIORY, FARNBOROUGH.

By F. H. CHEETHAM.

EVERYONE knows the tomb of Napoleon the First, "by victories guarded 'neath the golden dome that caps all Paris like a bubble." But comparatively few people know that the remains of Napoleon the Third, too, rest beneath a dome, and that within an hour's railway ride from London. It was in January, 1888, on the fifteenth anniversary of the Emperor's death, that his remains, together with those of the Prince Imperial, were brought from Chislehurst, where they had lain in the little Catholic church near the common, to their present resting-place in the mausoleum at Farnborough Hill, Hants, which the Empress Eugénie had built to receive them. The Empress originally intended to have built the mausoleum at Chislehurst, but being unable to purchase the site she wanted near the church, she gave up the idea, and in 1881 removed from Camden Place to her present residence at Farnborough. She bought the mansion formerly belonging to Mr. Thomas Longman, the publisher, and shortly after settling there started the building of the Memorial Church. It was designed by a French architect, De Tailleur, and is said to closely resemble the church of the Abbey of Hautcomb, the ancient burial-place of the Princes of Savoy. It is a florid Gothic structure crowned with a dome and lantern, and, standing as it does on the levelled summit of the hill, can be seen among the trees from the railway to the left as you approach Farnborough from London on the South-Western line.



ST. MICHAEL'S PRIORY, FARNBOROUGH. DE TAILLEUR, ARCHITECT.

"What I want to impress upon you," said Sir Gilbert Scott in one of his lectures at the Royal Academy in 1873, "is that the Dome should be welcomed into our revived Gothic architecture. That revival needs but such a welcoming of all that is good and noble to render it complete, and no feature possesses these qualities in a higher degree than the cupola." Yet to welcome *all* that was good and noble was precisely what the Revival could never bring itself to do, preferring rather to pursue what Mr. Prior calls the path of "ecclesiologist investigation," whereby it became possible to "build Victorian Gothic with all the constructional imitations of any given ten years of mediæval history."

The chief architectural interest of St. Michael's lies in this grafting of the cupola on to a Gothic church. It is not a large building, and its plan is of the ordinary cruciform pattern. Over the crossing rises an octagonal dome crowned with a lofty but well-proportioned lantern. The apse, with its outer aisle and clearstory supported by flying buttresses, has an appearance of great height, as it is built above the slope of the hillside, allowing for a crypt under the whole of the eastern end of the church.

The nave is covered with a single-span roof and is lit by three three-light windows on each side, with buttresses between, terminating in lofty pinnacles. The roofs disappear behind parapets of open stonework, and are finished with an elaborate cresting. Everywhere there is an exuberance of ornament. Flamboyant tracery, crockets, pinnacles and gargoyles of inordinate length go to make up a rather restless whole when seen near to. At a distance, however, the effect is not unimpressive, and the cupola is worked into the design with excellent effect. It is all, of course, on a small scale; and it is an open question whether the effect would be equally good were the scale increased. There is nothing architecturally remarkable in the interior of the church. There is a costly pulpit of carved Belgian oak, and on each side of the altar is a painting by Raphael. The church is used for public worship.

The memorial chapel proper is in the crypt beneath the chancel. It is entered from the outside by a door at the east end of the church. The altar is immediately opposite the door, and therefore at the west end of the chapel. The tombs of the Emperor and the Prince Imperial stand to your right and left under the north and south transepts respectively. The crypt is vaulted, simple in detail, and is lit by wide single-light windows. It is approached also from the church above by means of a fine stair case in teak. The granite sarcophagus of the Emperor was the gift of Queen Victoria, and is inscribed simply "Napoléon III. R.I.P." That of the Prince is similar in design, but has a longer inscription: "Napoléon, Prince Imperial, né à Paris, 16 Mars 1856, mort en soldat à Itrotrotiozy, Afrique Australe, 1 Juin 1879. R.I.P." A space is reserved for the last resting-place of the Empress. The quiet simplicity of the mortuary chapel is in refreshing contrast with the restless detail of the church above. Outside, round the east end, are planted weeping willows—cuttings from the famous tree at Longwood, obtained by the Empress when she touched at St. Helena on her way home from South Africa after visiting the place of her son's death.

Admission to the mausoleum is by ticket, which is purchased at the lodge by the gate on the left-hand side of the main road after leaving the South-Western station. The charge is 1s. The tickets bear the heading, "St. Michael's Priory of the Order of St. Benedict, French Congregation of Solesmes, Farnborough, Hants." The priests live in a red-brick house immediately on the south side of the church. The house is L-shaped, with a rather clumsy octagonal tower in the inner angle, surmounted with a high pointed roof and lantern. The recent Association law in France has had the effect of sending to our shores the Benedictines from Solesmes, who are to make their headquarters in future at Appledurcombe House, in the Isle of Wight, the ancient seat of the Earls of Yarborough.

Farnborough Hill mansion itself is some little distance from the church. It is well shut in by trees, and is difficult to get a view of in summer. It is a picturesque-looking "half-timber" house, but with more of a Swiss than an English air about it. It is the last place on earth you would associate with the Second Empire and the name of Napoleon. It was formerly known as Windmill Hill. The property once belonged to Dr. Chandler, Dean of Chichester, whose nephew sold it, about 1859, to Mr. Longman's father, who erected the present building. Considerable additions and internal alterations have been made by the Empress, but the well-known sign of Mr. Longman's firm, the Ship and Swan, can still be seen in places carved on the outside walls of the house.

Of course the historic interest at Farnborough Hill is its chief attraction. But apart from this there is a real interest in the design and architecture of St. Michael's Church, with its attempt to tread where our Gothic revival dared not venture. We may not care to emulate M. De Tailleur in his treatment of detail, but it is possible to receive suggestions from him in his general design. His Gothic cupola may be pronounced entirely successful. It is part and parcel of the building, not a detached feature in any sense, and its lines are in harmony with those of the rest of the structure.

We were reminded quite recently that the Gothic revival is not dead, though some thought, and more hoped, that it was. Liverpool, however, having expressed a desire for a "Gothic Cathedral," Sir Gilbert Scott's words recur to the mind, more especially, perhaps, as Mr. Emerson's selected design in the former Liverpool Cathedral competition attempted to solve this very problem of the cupola applied to Gothic architecture.

St. Michael's may not be worth while the thirty-three miles journey from London to Farnborough merely on account of its architecture. But there are many people who must find themselves now and again in the vicinity of Aldershot Camp to whom a visit to the imperial mausoleum would be of interest. This is not the place to adorn the tale by pointing a moral; but the architect, being, as we like to think him, a man of finer and more refined sentiment than he who gives up all his days to mere buying and selling, should not be slow to feel the immense pathos of the story that has brought about the rearing of this imperial tomb on a foreign soil.

A New Workhouse Infirmary at Sunderland has been erected on ground adjacent to the local workhouse, at a cost of about £40,000. The architects are Messrs. W. and T. R. Milburn. The new infirmary, which is designed to accommodate 200 patients, really consists of four departments—an administrative block, a pavilion for male inmates, a pavilion for females and a maternity hospital. Externally the buildings are of brick, faced with Sherburn House bricks; the lighting is by electricity, derived from the Corporation power stations; and the heating is accomplished by the means of the American Radiator Co.'s system. The contractors are Messrs. D. & J. Ranken, of Sunderland. Mr. A. J. Wilkins has acted as clerk of the works.

EIGHTEENTH-CENTURY ARCHITECTURE IN ENGLAND.*

BY J. A. GOTCH.

THE eighteenth century saw the final development of that great movement in art which began in the early years of the sixteenth. When mankind had once made up its mind that the masterpieces of Italy were the only examples worth following, nothing but time and determination were wanted to produce throughout Europe a general similarity of appearance and treatment in every branch of art. In no branch was copyism so contagious as in architecture, and in no branch was it so injurious. For architecture is essentially a constructional art, a fact which the eighteenth century did not realize (a constructional art, to be healthy and natural, must develop from within, and not from without), and a fact which wants no little reiteration at the present time when there seems to be a tendency to neglect construction for more attractive accessory subjects, and to desert the stately queen for her livelier handmaids.

Architecture in the eighteenth century was the Five Orders and nothing more. An old Roman, called Vitruvius, who had been dead 1700 years, was dictator, and those of his followers who differed from his precepts, although sometimes excused on account of their success, were admonished to be careful how they risked any deviation from the paths of perfection which he had pointed out. Gothic architecture was despised and regarded as barbarous. It was not that the votaries of the art preferred a Classic dress to a Gothic; for them the buildings erected in the Middle Ages were not architecture at all. The "Gothick Order," as they called it, is described by one of them as "the Folly and very Ape of Architecture." Such an attitude of mind is hardly intelligible to us, who recognise in Gothic architecture at once the most logical and daring form of construction that man has yet employed. It is hardly less difficult to understand how they can have failed to be impressed with the majestic solemnity of a great Gothic cathedral, and yet they did fail—even such cultivated men as Evelyn and Addison. The phrase about the "very Ape of Architecture" occurs in a treatise by a lively Frenchman, M. Freart, and, considering the subject, a very entertaining treatise it is. But Evelyn's views were those of a sagacious unimpassioned Englishman, and are worth quoting at some length as illustrating the standpoint from which the early eighteenth century looked at the subject. In treating of architecture, he says:—

"It is the antient Greek and Roman Architecture only which is here Intended, as most entirely answering all those perfections requir'd in a faultless and accomplish'd building; such as for so many Ages were so renowned and reputed, by the universal suffrages of the civiliz'd world, and would doubtless have still subsisted. had not the Goths, Vandals and other Barbarous Nations Subverted and demolish'd them, introducing in their stead a certain fantastical and licentious manner of building, which we have since call'd 'Modern' (or Gothic rather), congestions of heavy, dark, melancholy and Monkish Piles, without any just proportion, use or beauty, compar'd with the truly antient: So that when we meet with the greatest industry, and expensive Carving, full of fret and lamentable imagery; sparing neither of pains nor cost; a judicious spectator is rather distracted and quite confounded than touch'd with that admiration, which results from the true and just symmetrie, regular proportion, union and disposition; great and noble manner which those august and glorious fabrics of the antients still produce.

"It was after the irruption, and swarms of those truculent people from the north, when instead of those Beautiful Orders they set up those Slender and Misquine Pillars, or rather bundles of Staves, and other incongruous props, to support incumbent weights, and pondrous Arched Roofs, without Entablature; and tho' not without great Industry nor altogether naked of gaudy sculpture, trite and busy carvings; 'tis such as rather Gluts the Eye, than Gratifies and Pleases it with any reasonable Satisfaction: For Proof of this (without Travelling far abroad) I dare report my self to any Man of Judgment, and that has the least Taste of Order and Magnificence; If after he has look'd a while upon King Henry the VIIth's Chapel at Westminster; Gaz'd on its sharp Angles, Jetties, Narrow Lights, lame Statues, Lace and other Cut-work and Crinkle Crankle; and shall then turn his Eyes on the Banqueting-House built at White-Hall by Inego Jones after the antient manner; or on what his Majesties present Surveyor, Sir Christopher Wren has lately advanc'd at St. Paul's and compare them judiciously without partiality and prejudice; and then pronounce, which of the two Manners strikes the Understanding as well as the Eye, with the more Majesty, and Solemn Greatness. In this sort have they, and their Followers ever since fill'd, not all Europe alone, but Asia and Africa besides, with Mountains of Stone, vast and Gygantick Buildings indeed; but not Worthy the name of Architecture: Witness, what are yet standing at Westminster, Canterbury, Salisbury, Peterborow, Ely, Wells, Beverley, Lincoln, Gloucester, York, Durham, and most Cathedrals and Minsters."

Thus far Evelyn. That Addison had no clearer insight into the nature of architecture will be seen from the 415th "Spectator," where he says:—

"Let anyone reflect on the disposition of mind he finds in himself at his first entrance into the Pantheon at Rome, and how the imagination is filled with something great and amazing; and, at the same time, consider how little, in proportion, he is affected with the inside of a Gothic cathedral, though it be five times larger than the other; which can arise from nothing else but the greatness of the manner in the one, and the meanness in the other."

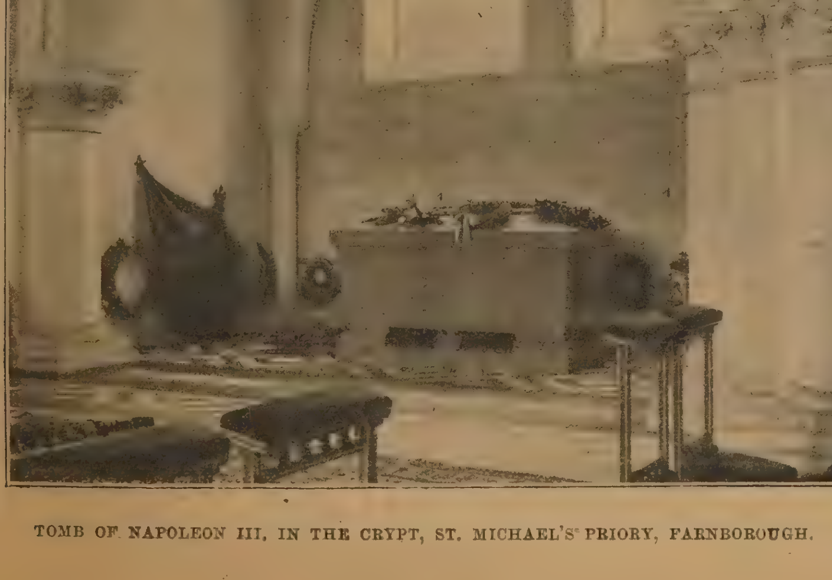
The fact is that architecture to them was, as already said, the Five Orders and nothing more. Architecture, in their opinion, dealt almost exclusively with the external appearance, and they dismiss in a few sentences such considerations as the disposition of rooms. Planning to them meant first and foremost the arrangement of their building in regard to its appearance, not in regard to the functions it had to fulfil. Broadly speaking, a well-designed building is as much a product of evolution as natural scenery or the forms of plants and animals. Natural scenery is almost entirely governed by the geological formation of the district. Plants and animals have assumed their various forms chiefly as the result of the necessities of their growth, which again are dictated by the functions they have to fulfil. And so it is—or ought to be—with a building. Architecture is not only the art of building finely, it is the art of building finely in order to comply with certain specific conditions.

This notion of architecture never occurred to the eighteenth century, brilliant though it was: and so the chief aim of its architects was to dazzle and impress the spectator, not to please and satisfy the indweller. Lord Chesterfield told General Wade, for whom the Earl of Burlington had designed an inconvenient though handsome house in Burlington Street, "if he could not live in it to his ease, he had better take a house over against it and look at it"; a piece of advice by which many a nobleman might have profited.

It has been observed that when people take to writing about art, they have ceased to practice it to perfection. So long as it is spontaneous, its followers need no directions; it carries *them* along, they do not force *it*. But when its natural vitality is spent and its followers are no longer borne unwittingly onwards, then spring up more or less gifted observers, who point out the ancient tracks and show how they may be continued: but unless among them be some who know what kind of force went to the making of the tracks, and can kindle the fire to produce the force, all the most accurate and beautiful drawings of those splendid vestigia will not enable a single one to be repeated.

Ever since the beginning of the fifteenth century—that is, for three hundred years before our period—Europe had been studying the footsteps of the Romans; for more than half that time England had thrown herself into the pursuit: and now the patient efforts of many writers were to be rewarded, and it was to be the aim of every generous patron and every architect of ability to make our English buildings as much like those of Italy as they could. Architectural design was to be a matter of rule and compass. What could be easier? The text-books gave the proportions not only of the modern buildings of Italy—or rather the Orders which adorned them—but also of some ancient ones upon which the sacred eye of Vitruvius himself must have rested.

Macaulay has observed that during the latter part of the seventeenth century and the early part of the eighteenth the heroic couplet was so much in vogue, and was brought to such perfection by constant use, that every poetaster could employ it with as much facility as Pope himself. So it was in architectural design. The rules were so well known that it required no genius to use them—nobody expected any skill in planning—and thus it came that the same dull propriety characterised every building that was erected. Just as in poetry, it is not the polished form of the verses that marks the true poet, but the ideas contained in them; so in architecture, it is not the correct marshalling of columns and the "nice conduct" of entablatures that must be our criterion, but the manner in which the whole building satisfies and expresses the wants which it is supposed to supply. Judged by this standard, how many



TOMB OF NAPOLEON III, IN THE CRYPT, ST. MICHAEL'S PRIORY, FARNBOROUGH.

---

* A paper read before the Birmingham Architectural Association on November 22nd, 1901.

of the designs in Campbell's "Vitruvius Britannicus" would come within the category of true architecture? And yet those volumes contain nearly all the larger houses built in the first half of the eighteenth century. One of his designs Campbell introduces thus: "This design of my invention in the Theatrical stile is most humbly dedicated to Tobiah Jenkyn esq." The theatrical style he tells us "admits of more gaiety than is proper either for the Temple or Palatial style"; and in that word *theatrical* lies the key to much of the designing of the period. It is all more or less theatrical, done to impress the beholder; just as in the second half of the century the laying-out of gardens and grounds was contrived with the aim of producing the effects found in the pictures of Claude Lorraine and other landscape painters; down even to the introduction of artificial ruins.

In describing the plan of his house in the theatrical style dedicated to Tobiah Jenkyn esq., Campbell dwells not on the convenience of arrangement, not on the cheerful aspect of the rooms or any special contrivance for the comfort of the inhabitants, or whatever goes to make a house a home, but on the proportions of his principal apartments. "Here," says he, "is the double and single cube, the Hall being 27 × 54. Here is 18 × 27 which is the sesqui altera, and 21 × 27, the sesqui tertia, and you pass gradually from the larger to the lesser": all of which may have satisfied the wants and aspirations of Tobiah Jenkyn esq., but do not compensate his descendants for the absence of those arrangements which make daily life tolerable.

The needs of daily life went but a little way to model the great houses of that time. Architectural grouping, in order to impress the beholder, often led to dividing the mansion into separate blocks, one for the family rooms and State apartments, one for the kitchens and servants, and one for the stables. The kitchen, therefore, would be hundreds of feet off the dining-room, a drawback against which Evelyn warned his readers, "or else" says he, "besides other Inconveniencies, perhaps some of the Dishes may straggle by the way." Sometimes the servants' quarters were located in two detached blocks hundreds of feet apart, balancing the composition of which the family rooms formed the centre, and joined to the latter by open colonnades. How the service of the house could be carried on with the two halves of the staff separated from each other by a five- or ten-minutes' walk is not very clear; but of course the mansions were not built for the servants, but a little for the family itself, more for its grand guests, and most for the casual spectator who was to admire the lordly pile as he passed by.

The servants had to put up with what accommodation they could get. Their hall might be a vaulted underground room lighted only by areas, as at Buckland in Berkshire, and their bedroom windows might look out on to the back of the parapet. The butler might have to sleep in a room without any outside wall and no direct light and air. But in those days servants were merely servants and could hardly expect to be exempt from suffering for architectural effect when their employers were content to suffer as well, though in a less degree. And they must have suffered; for, wholly apart from considerations of bad service, the family were often located in a low basement with all the weight of the State apartments over their heads. Their rooms were not contrived to catch the morning sun or to get a splendid view, or, indeed, for any particular purpose relating especially to them, but they were arranged to fill up the space beneath the great rooms of State, and if they were comfortable it was more by good luck than good management.

The architects of those days were in fact more or less of amateurs, and the kind of architecture in demand was such as amateurs could supply. Pre-eminent among them—at any rate in social position—was the Earl of Burlington; and when we consider this fact for a moment, can we be surprised at the amount of unreal and theatrical design that was produced? Who could expect an earl to concern himself with the niceties of household planning? No wonder that General Wade received that advice from Lord Chesterfield to take a house over against his new mansion and look at it. Yet all through the century Lord Burlington was looked up to as the greatest patron of art that England had ever produced, and especially of architecture. Horace Walpole extols his taste and his ability: he "had every quality of a genius and artist, except envy"; yet withal Walpole cannot disguise from himself that Ripley, who was an architect by occupation (or, as they were called in those days, a surveyor), "in the mechanic part, and in the disposition of apartments and conveniences was superior to the Earl himself."

Pope, of whom Lord Burlington was a patron, satirizes Ripley more than once, but then Ripley did not belong to Pope's faction. Pope himself in one of his epistles points out a way in architecture which no one seems to have followed, not even the nobleman to whom the epistle was addressed. Writing to Lord Burlington, he says:

You show us Rome was glorious, not profuse,
And pompous buildings once were things of use.

And again:

Something there is more needful than Expense,
And something previous ev'n to taste—'tis Sense:
Good sense, which only is the gift of Heav'n,
And tho' no Science, fairly worth the Seven.

Toward the end of the epistle he reverts to the same text:

'Tis Use alone that sanctifies Expense,
And Splendor borrows all her days from Sense.

It is rather amusing that a sermon founded on such an excellent text should contain so much that is at variance with it. Nor can we help smiling that the Earl's work should be supposed to embody the principles here laid down, when we remember poor General Wade's house or the villa at Chiswick, beautiful no doubt in grouping and proportion, but of which Lord Hervey said, "The house was too small to inhabit, and too large to hang to one's watch." Walpole, who records this witticism, has some remarks on the house which are worth repeating. It is "a model of taste," he says, "though not without faults, some of which are occasioned by too strict adherence to rules and symmetry. Such are too many correspondent doors in spaces so contracted; chimnies between windows, and which is worse, windows between chimnies; and vestibules, however beautiful, yet too little secured from the damps of this climate. . . . The ground apartment is rather a diminutive catacomb, than a library in a northern latitude." Then he adds a few sentences which throw some light on one of the motives that actuated the eighteenth century. "The larger court, dignified by picturesque cedars, and the classic scenery of the small court that unites the old and the new house, are more worth seeing than many fragments of ancient grandeur, which our travellers visit under all the dangers attendant on long voyages." There you have it—"the classic scenery," and the "fragments of ancient grandeur," which were to be rivalled by English villas.

It is from the opinions of men who lived in the eighteenth century that we can best gather the motives that underlay their actions, and therefore a further quotation from Walpole may be excused: "It was in this reign" (of George II.), he says, "that architecture resumed all her rights. Noble publications of Palladio, Jones, and the antique recalled her to true principles and correct taste; she found men of genius to execute her rules, and patrons to countenance their labours. She found more, and what Rome could not boast, men of the first rank who contributed to embellish their country by buildings of their own design in the purest style of antique composition." We have seen one of these men of the first rank, Lord Burlington, and what he did. Another was Lord Pembroke, and he is worth singling out because, according to Walpole, "no man had a purer taste in building than Earl Henry, of which he gave a few specimens, besides his work at Wilton." Now his work at Wilton is not easy to assign, for the house is attributed largely to Inigo Jones, and the "theatric bridge," as Walpole calls it, to Morris. But at any rate this bridge is less objectionable than the other "theatric" work of the time, inasmuch as it imposes no special inconvenience on anyone; yet, whether a bridge of this kind is in harmony with English scenery is a debatable question.

Taste, of course, was the great requisite in that age. Lady Teazle endeavoured to acquire it along with other fashionable accomplishments, to her husband's great scorn—what had she, a country-bred girl, to do with elegant expenses and fashion before she married him? "For my part," replies the lady, "I should think you would like to have your wife thought a woman of taste." "Taste!" cries her husband. "Zounds, madam, you had no taste when you married me."

The extravagancies of the second quarter of the eighteenth century sprang from an indulgence in taste apart from consideration of propriety, and it was the often-mentioned Lord Burlington who led to them, partly by his own work and partly by his publication of the designs of Inigo Jones and Palladio's antiquities of Rome. But it only wants a comparison of Inigo Jones's work with that of Burlington and his successors, or a comparison of Wren's with theirs, to see how those two men were really architects, while the others were but amateurs dabbling in what they did not thoroughly understand and into the details of which they scorned to enter.

But while we cannot but feel that in the true essentials of architecture they were sadly lacking, yet we must concede that they produced striking results. One of these fine palaces when it was surrounded by its original gardens must have been remarkably imposing. Take Blenheim, for instance. If we regard it as a home, we must be disappointed, but as the dwelling of a great noble, living in state and surrounded with all its attendant ceremony, receiving other great nobles with their retinues and housing them in more magnificence than comfort—in these respects it has much to claim our commendation. There is much excuse for it in the fact that it was a gift from the nation to its greatest son; it had to be splendid at all costs; yet it did not meet universal appreciation even in those days, as witness the lines of Swift—

'Tis very fine,
But where d'ye sleep or where d'ye dine
I find, by all you have been telling,
That 'tis a house, but not a dwelling.

But when these grandiose ideas were applied to the houses of ordinary noblemen, much as they may have been cherised at the time, the noblemen's descendants find it hard to live in their palaces and hard to maintain them.

There is not time enough on the present occasion to dwell much on the gardens that surrounded these great houses, but they were an acknowledged part of the general design; and now that they have in most cases disappeared, the vast houses, lacking their support, seem more wanting in common-sense than they otherwise would. Among the illustrations in Campbell's "Vitruvius Britannicus," which may be considered as the epitome of the period under discussion, there are not a few showing the lay-outs round the great houses, which were founded partly on Dutch and partly on French examples. It was, however, probably Versailles that set the example to our English nobility, though nothing was done here on so vast a scale. The Duke of Montagu, who was ambassador at the French court for a number of years at the end of the seventeenth century, occupied the first few years of the eighteenth, after his return, in "erecting his seat at Boughton, in Northamptonshire, after the pattern, and as his Dimensions would allow, after the very model of Versailles." It must be admitted that Boughton House is a very plain copy, or rather reminiscence, of Versailles; at the same time, its garden and wildernesses were of unusual magnificence and size, and adorned with numerous statues and a considerable extent of canals and ornamental water enlivened by *jets d'eau* quite in the manner of Versailles as recorded in prints.

The house itself, although of a rather plain and sombre cast, is interesting as an almost unaltered example of an eighteenth-century mansion, simply though richly furnished. Its floors are polished, its walls panelled in large panels surrounded by a bold bolection moulding, the doors are lofty and set in thick walls, the chimney-pieces are simple and massive and surround wide and deeply-recessed open fireplaces. The ceilings are (many of them) by that rather dull painter, Verrio; still, they impart a large amount of character to the place. Here and there is a panelled room, or a fine chimney-piece of a hundred years before, showing that the house was not erected entirely new by the ducal ambassador. The walls are hung with ancient portraits and pictures, and the floors are full of ancient furniture. Through the heavy sashes one looks out on to the undulating park and the long and lofty rows of trees which form part of the celebrated avenues. There are attics innumerable, scattered in every direction, and approached by staircases where the handrail is mitred round the plain square newels, and twisted balusters join it to the swelling string. Through these attics you may go, and down a different staircase, to find yourself in a room that you thought was a furlong off on the other side of the house. Altogether an interesting place, and one that gives a good idea of the haphazard arrangement of a large eighteenth-century house.

At any rate, Boughton House was a home which could be inhabited all the year round—even the State rooms; which is more than can be said of many of its contemporaries. Nevertheless, with all their drawbacks these palaces were stately. The plans look gorgeous on paper, and so do the sections showing the internal decoration. The effect of the places themselves is, perhaps, rather depressing on the ordinary person; the grandeur is a little too obvious—there is no such feeling of homeliness as in the many-panelled rooms of the early seventeenth century; but, when all is said, the fact remains that the architects of the later time had a very definite aim in what they did, and they achieved it.

When we leave the mansions of the nobility and come down to the houses of the squire or the well-to-do merchant, we find ourselves in a much pleasanter atmosphere. They have a quiet dignity about them which is decidedly restful and attractive, especially those of the first quarter of the century. In later times the portico idea became too prevalent, which consisted in affixing to the front of an otherwise plain house some variation of the columned front of an ancient temple. But the earlier houses, with wide corniced eaves, simple horizontal strings dividing the rows of sash windows, and combining with the quoins that emphasize the angles—these will no doubt long continue to form the model for houses of similar use and capacity. It is just a question whether this is quite the type that suits the present age; for our wants seem to grow always more complex and to require a more elastic style than one depending for its effect on strict symmetry and unbroken horizontal lines.

If we cannot take a wholly sympathetic view of the purely architectural work of the eighteenth century—at any rate in its more notable examples—neither can we forget that we are indebted to it for much that is suggestive in the work that embellished the architecture, especially in wood and iron. The ironwork of that period has never been equalled in England, and it lends an air of distinction not only to great houses like Drayton in Northamptonshire, but to little suburban villas at Hampstead. The joiner's work of the time is full of suggestions. The sash window alone was enough to revolutionize architectural treatment; and the far-reaching effects of a mitred moulding are impossible to follow. Through all the changes of two centuries these two facts have remained with us—sash windows and mitred mouldings—and there seems no immediate prospect of their being superseded. The work of the plasterer is not so admirable as that of the joiner. He had become too expert, and was able to perform prodigies of modelling and high relief which finally undid him, and he and his art perished together.

If we are to seek inspiration from the work of the eighteenth century, we shall find it in two directions: First, in the grand schemes of house and garden combined, and in the general grandeur of treatment bestowed upon the great houses of the time. Not that we are to copy either blindly; but it is very desirable to realize how much the house and its surroundings depend upon each other; and equally desirable to learn how a grandeur of manner may be acquired. Secondly, in the sober and simple houses, where the plainness of the general appearance is sometimes unexpectedly broken by the quaint treat-treat of a door or a chimney, and where the joiner's work is full of homely lessons.

It is often from the vernacular architecture of the country that we can get the most useful hints, whereas it is the palatial architecture that gives its stamp to the period and goes to furnish the text-books. The one is for Show first and Use second; the other is for Use first and Show second. The palatial architecture of the eighteenth century was surely given to us more as a warning than as an example; but it is worthy of attention, just as all phases of architecture are which have acquired any hold on public affection; and we are not likely, in view of our present method of study, to fall into that attitude of mind towards any style which Evelyn exhibited towards Gothic. If we bear in mind that architecture must develop from within and not from without, we shall never again become the slaves of a foreign and a dead hand, as our forefathers were in the eighteenth century, but we shall go forward, as we are indeed at the present time going forward, on different paths perhaps and at different rates of speed (sometimes not without sharp divergence of opinion as to the propriety of particular steps), but always towards the same goal—the ennobling of our *alma mater*, the mother-art of the world.

A FRENCHMAN'S GUIDE-BOOK.

BY HENRY ROSE.

QUITE recently we were constantly hearing about the Paris Exhibition of 1900. Now I wish to call attention to a monumental work which deserves to be rescued from oblivion. I refer to a book of about one hundred and sixty pages bearing in gold letters on its neat red cover the following title: "Universal Exhibition, Paris, 1889, Practical Guide," and an illustration of the Eiffel Tower which was to constitute its chief attraction. It was published in Paris for the use of English and American visitors. That the information it contains is remarkable, the following extracts will serve to show.

In the preface we are told that "the period of incubation (brooding) lasted since 1883 till March 1884; when they considered but about a national Exhibition . . . the ambition increased. This ministery thought they would give to this industrial manifestation an international character. They would impose the peace to the whole world." A laudable endeavour which has not yet been realized.

In the "Note of the Editor" we are warned that "for whom who comes there for the first time, it is impossible to direct and recognize one's self without a guide," but in this Practical Guide "we trace him what he has to see . . . still which direction he must follow, which coffees he has to choose to refresh himself." . . . "May the visitor follow us with confidence and he will not have any reason to regret it." On the "First Day" we have "the Exhibition seen in a straight line." "In the first of the perspective are erected the gilded statues of the parts of the world which are hooking the sun rays: at our feet we see the green declivities of the plat-bands, the sheets of the bassins and we hear the bubbling of the Cascades." We are told that "At the centre of each of the palaces of the Fine-Arts and the Liberal-Arts is erected a great dome enamelled with white tone, blue turquoise, yellow and gold of an harmonious effect. Each dome is placed on a wall whose layers in bricks alter with others of the same tone as cupola, and which is supported by consoles crowned by enamelled vessels"—a description which leaves a good deal to the imagination.

Clinging to the hand of our guide, we proceed to the Eiffel Tower, which was erected "in order to attire the stranger." To start with we are told, "It is a pyramid with four bend arcs connected two by two at their inferior parts by arches." On the "second stair-bed" is a "glazed room, quarry of 30 metres aside." The lifts "following the declivity of the jambs . . . deserve the two first platforms," whence "two other lifts withdraw you smoothly till the cupola." If you prefer to walk up, then you should know that "seventeen hundred eighty twelve steps bring you to the top . . . of the highest monument of the globle."

Further on much detailed information is given, after first propounding the following question: "How is the control made? or, to precise more, how do they pay the price of ascension?" We are then bidden to admire the fountain, a "lake in minature in which swans take their sports. Itself has 12 metres of diameter at the level of the wather." Of the figures there represented "Europe under the lines of a woman leaned upon a printing press and seems deeped in profund reflections," and "Australia finally is figured by a woman, buttressed on herself"—a sort of architectural kangaroo—"like an animal not yet tamed ready to throw itself on his prey without waiting to be attacked"; altogether not a happy illustration of the motto, "Advance Australia!"

Then we have the Central Fountain in "a vast French garden at two floors of ground . . . where bloomy baskets put their enchantment," and we are assured that "in the evening at the electric light the impression is chilling."

We are now ready to start on the first walk—"this walk of recognition." "It is the moment or never to walk among the surprising restitution of which M. Garnier made him the promoter . . . resolved to erect an improvisated town," representing the History of the Human Dwelling. "Subdivision 5°" is, "as it can be seen, a kind of architecture which has not its likely in the world . . . One may remark that the lacustre cottage is made with trees cut in two by the carbonisation because men were in want of saws and to come out of it they employed coals in fire." The palace of the children has "pointed roofs surmounted with turnpikes which turn at the wish of the wind." "Enter there with your little family and you will certainly not annoy you." We then have our attention drawn to a very accommodating building with "an aspect half oriental, half quite what you like." A little further on we must have lost ourselves, for "we find us at the Pavillion of Monaco, pretty construction which expresses well the character of this principality of green carpet." On the second day we visit the Palace of the Fine-Arts, the entrance being "adorned with arabescs where brightens the palet of the crokery man." We also enter the gallery devoted to artillery, "where is rolling a humming crowd like an ant-hill in rumour." So we hurry on to hides and leathers. "Here are at first the varnished leathers of all colours of which the genious of the exhibiters has made rose-windows very agreeable to the eye," which shows that we cannot trust him as an exponent of Gothic architecture. The Pavillion of the Press "we make remark quite particularly to the visitor." It was "build with wooden pans. The exterior is of a very fine aspect; the porch is decorated with pans in earthenware." His gift for architectural description is quite rare and always interesting; for instance, the next day we have another building of "an originality quite particular. . . all in wood of fir trees. Its decoration is of a simple style . . . on a green bottom whose tonality is harmonious by black and white rehauts, bronze and gold detach them of the decorative massives of a delicate drawing, borrowed from the ornamental flore." No need to see it after that vivid mental picture. In passing we may note that "England offers likewise pianos in nut wood like they are done there" (perhaps he means Broadwood!), and that the photographic exhibits include "instantly and other apparatus."

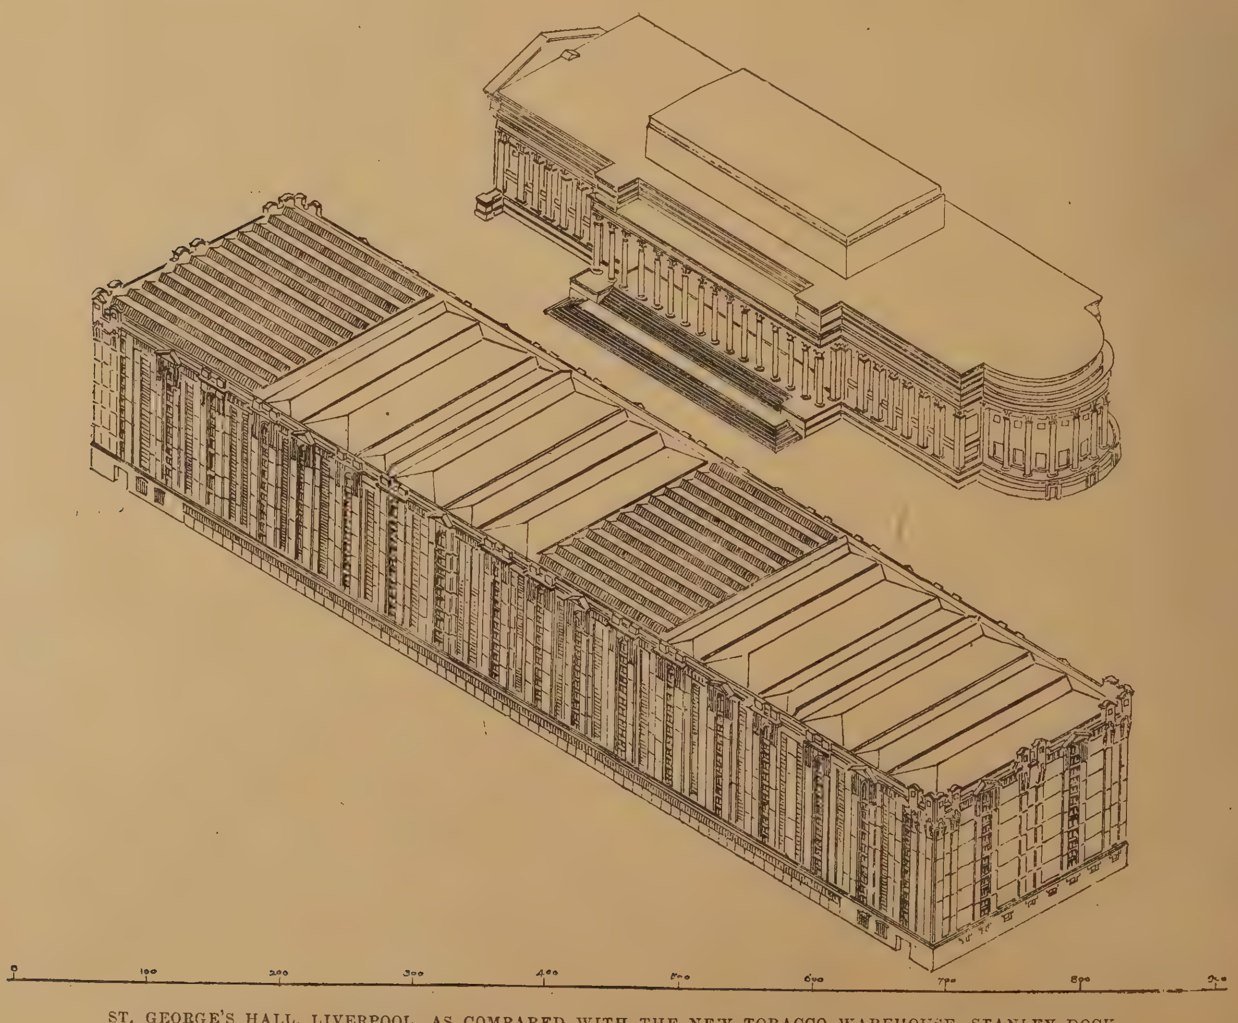
Our guide tells us that "Sweden has no section. The effort was too great. This little country did not wish to tempt it. In revenge, Norway is splendid." He concludes his remarks thus: "Sculpted wooden constructions which have no other imperfection but this one to be a little massive." Cheap French ornaments prompt him to remark: "All these marvellous things are at the reach of the less profligate purses." On wall-papers: "How many pretty things one makes in our days, who would seem devoted to the banality?" But ere we can hazard a solution to the conundrum we have entered the Japanese section. "What to say of it? What to cite? All is unheard, superb, unlikely . . . . furnitures, in lakes in bronze, screams originally painted." A scream with the paint off one might easily have overlooked but for his trained assistance. Next we visit Cairo Street: "When one comes out of the Palace of divers Industries, a little giddy pate and aching of a blustering decoration, the eyes rest them there instantly. Not any art has carried at the same degree of perfection as the arabian the grace of the lines, it appears that the idea of the happy life consisted for it to the indolence in a cool place with exquisit und light shapes around it, it penetrates you with what I don't know of languishness." Having escaped from this enervating neighbourhood we proceed to investigate the electric light. "The lamp Ezmos is of a simple and robust construction and does not demand any special entertaining." On the merits of a certain gas-burner he says: "The gas being no more warm and arriving from up and down, not any deposit nor any obstruction could be produced," a scientific and perfectly convincing explanation. It is interesting to note as we pass to the Javanese village that "one ignores not that Java is the most important of the Dutch colonies in Australia." We next make a tour of the French colonies, where is a Tonkin pavilion with "the roofs formed by several others which follow in graduation according to the typic style of Cochinchina." The self-satisfaction of our guide is complete to the end when he says: "There is finished our common walk in a happy way after six days which we dare believe it did not seem to you long, your curiosity finding a constant aliment at every step which we made you do." We are then taken round certain other shows outside the Exhibition, and his remarks, though much in the same strain, do not seem to need any special comment. The book has the merit of perfect good faith, which it shares with the better known work, "English as she is spoke." The last great Exhibition, as far as I am aware, did not call forth any effort of a like nature, so this work may be considered unique. It was on sale in Paris at the time for 3 francs.

Mr. Edmund William Smith, M.R.A.S., archæological surveyor of the North-Western Provinces and Oudh, died of cholera at Mohinpurwa, Bahraich, on November 21st, in his forty-fourth year. He made elaborate examinations of many architectural remains, repaired several, and published various large illustrated volumes on these remains. A biographical notice will appear in our next issue.

NEW TOBACCO WAREHOUSE AT LIVERPOOL.

LIVERPOOL has gradually acquired the chief interest in the tobacco trade. Many important manufacturers have set themselves down in the city, and it has also become the principal port of entry and the main centre of distribution. To meet the present needs the Mersey Docks and Harbour Board has built an enormous warehouse on a site which was once submerged with water and formed part of the Stanley Dock. The building (which is illustrated in our centre plates this week) was designed and constructed under the supervision of Mr. A. G. Lyster, the chief engineer to the Board, and his assistants. It has been called the largest commercial building in the world. That may not be precisely true, for it is difficult to obtain data, and still more to set up a standard of comparison. But if it be not the largest warehouse in the world there are certainly few to equal it, and it deserves to be described as an illustration of latter-day enterprise in the famous port. Under modern conditions half the space in the Stanley Dock, which was almost square in formation, was useless for the accommodation of shipping, and the engineers decided to cut the dock in half by building a new dock wall down the centre. The same number of vessels can load and unload in the dock to-day, and yet a site has been found for the immense warehouse which now stands there. The southern portion of the dock was filled in, and upon the land so made the warehouse was built. It is no less than 725ft. long, 165ft. wide, and the height above the roadway is 125ft. The foundations were carried through the made land down to the solid rock; and if the height from the foundations to the roof be taken, it is 160ft. The cubical contents of the building are 15,648,951 cub. ft., and the area of the ground is 13,300 sq. yds., or about 2¾ acres. The building is divided into six sections by solid party walls which rise 6ft. above the roof, so that a fire occurring in one section may be kept from spreading to the others. Access from one section to the other is obtained on each floor by means of two double iron fireproof doors, with an air-space of several feet between them, and with these closed it would be relatively easy to localise and control an outbreak of fire. A very complete installation of electric light is provided for all floors and for the ships which may be discharging on to the quay. Many hydraulic hoists have also been provided along the dock front; and within the hoist shafts are carrier pipes for salt and fresh water, which will bear water to the topmost storey from the tanks beneath the roadway into which the salt water has been pumped. Thus it will not be necessary in the event of an outbreak of fire to carry hose from the ground to the roof, but the hose can be affixed to the main on the floor where the fire is. All girders are enclosed in concrete, the supporting pillars have casings of fireclay, and the doors between each section are raised above the floor level, so that water poured into one section would not flood the others, special arrangements having been made to carry it away. Indeed, this building is as interesting in construction as it is monumental in size.

Frithwood House, Northwood, the residence of Mr. E. J. van Wisselings, is situated in a wood on the high ground between Northwood and Watford, and is built of red bricks with old tiles on the roofs. Similar red bricks have been used for the terrace wall, which carries a balustrade of Bath stone. A feature of the design is the garden which has been laid out in a formal manner, a large amount of oak trellis being used for the work. This has been omitted in the illustration on page 337 for the sake of clearness. At the south-west corner of the terrace an old-fashioned brick-paved court has been formed, having a fountain in the centre and an orange-tree at each corner. The house is designed in a domestic type of Renaissance, with an aim at simplicity and comfort. Mr. Mervyn E. Macartney is the architect.



ST. GEORGE'S HALL, LIVERPOOL, AS COMPARED WITH THE NEW TOBACCO WAREHOUSE, STANLEY DOCK.

Bricks and Mortar.

APHORISM FOR THE WEEK.

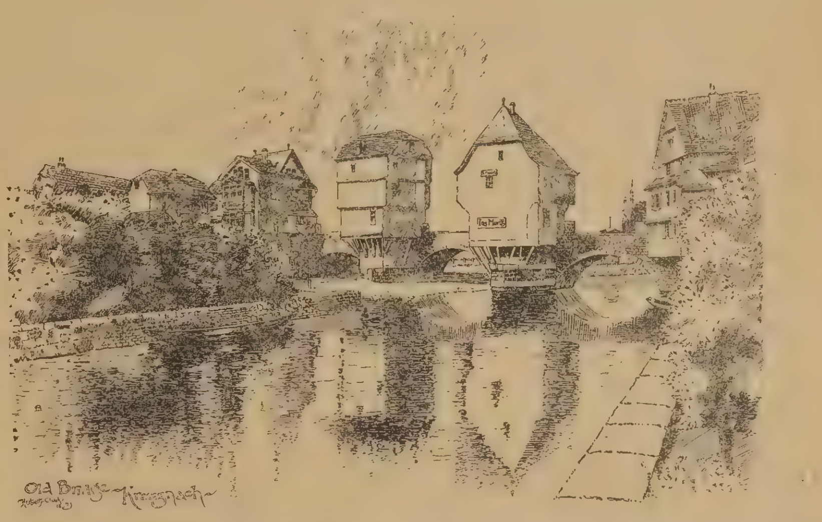
One must have taste to be sensible of the beauties of Grecian architecture: one only wants passions to feel the Gothic. In St. Peter's one is convinced that it was built by great princes: in Westminster Abbey, one thinks not of the builder.—HORACE WALPOLE.

Architectural Shams. MR. E. R. TAYLOR, head-master of the Birmingham School of Art, recently distributed the prizes at Brightelmston School, Birkdale Park, Southport. In his address Mr. Taylor spoke of the value of drawing as a part of education. They learned to draw because it was a help to other studies, and another reason was that they might help to lessen the ugliness of to-day. Until about a century ago, Mr. Taylor said, all things made by man, from buildings to articles for kitchen use, had in them some element of beauty and fitness, and generally so much of rightness and beauty, that the former could not be pulled down without protest, and the latter were gathered into museums. Looking at the two extremes of each they must admit there were distinct lines of demarcation between beauty and ugliness. In architecture the manor-houses and cottages on the Cotswolds, or the half-timber work of Cheshire and Warwickshire, were things of beauty, and in contrast to most of the modern mansions and workmen's cottages. If they admitted that beauty and ugliness were not convertible terms it was worth while to inquire into the cause of so much of the present day ugliness. If they looked at Turkey, India and Japan, they would find that good work continued to be produced in these countries until recently. The work, however, was now contaminated by modern European influences, the same influences which had made our work in this country bad. Japan was the most recent and lamentable instance. It had hurried to adopt Western ideas of life, and its exhibits at the Glasgow Exhibition was the most melancholy sight there. One cause of this present-day ugliness was the attempt to revive old styles. The notion that we could bring to life dead styles was a misuse of the study of history, and yet it still prevailed. Another cause of bad work was the love of shams—not toleration only, but a real love of shams. When he began work in Birmingham, students and others on showing him their work generally reached the climax of praise by stating it was like something it was not. As an instance of this, he cited the treatment of a rubble wall which had a beauty of its own with its irregular mortar joints, giving a texture to secure which in other things great expense was often incurred. This was spoiled by ruling straight mortar joints at all angles to make it less like rubblework. A final cause affecting all the others was the judgment by money value. This tainted all their work. In closing, he advised them in their pursuit of beauty to study simple and right construction, to study old work, to see how it grew, to love Nature, the source of all that was beautiful, and to live simply.

An Architectural Wonder. THUS speaks the reporter on the "Southport Guardian" of the new pier pavilion at Southport, just completed. "This very fine building makes no bid for fame as a specimen of Classical architecture, but, with its circular roof, its turrets and balconical minarets, arranged in Oriental fashion, the claim may be made for it that its beauty is bound to appeal to the eye. It looks a dainty erection of glass and wood, hardly fitted for exposure, more suitable for the fairyland scene of a pantomime, but it really is a structure of solidity and security. From the tips of its four gilded minarets down to the concrete in which rest the girders, the new pier pavilion is solidly, squarely, substantially built—built with an eye to fair weather, but with both eyes open to the possible ravages of gale, storm or fire. When the winds are sending headgear scudding over the roads, swaying vehicles, overturning cabs, wrenching chimney-pots from their mortar foundations, it will be found that the pier pavilion stands unharmed as it stands to-day; and when the tiny spark—that often developes into the raging fire that hisses and burns and crackles, as the few who witnessed the destruction of the former pavilion in the early hours of that fateful morning so well remember—falls in the pier pavilion, it will not find the same congenial timber, and will consequently die. Of course, accidents may happen but so far as lies in the ken of a really competent architect and a really capable builder, the new erection will withstand almost anything. But these precautions are more the concern of those authoritive bodies who represent the public. We delegate the power to rule these things, and then the public concern themselves but with the appearance of things, and that is all right. So to-day, to the right hand of the pier entrance one may see, as in a vision, a handsome thing of blue and gold and crystal—for the pavilion is a miniature Crystal Palace. It seems to be all glass—glass here and there relieved by a lath of wood, and the whole surmounted by a nice-looking wooden roof, roundly shaped, with the corners set off with the golden minarets we always look for in a coloured view of a Turkish town. The design is indeed a worthy one for a palace of pleasure. The whole building rests upon girders fixed on the cantilever principles, and is thus perfectly secure. Not only that, but the principle affords a slight—entirely imperceptible to the ordinary person—spring to the structure, and thus makes it safer than is the average building . . . . . Throughout the building, except where it is here otherwise stated, it may be taken that the wood used is the best pitch-pine . . . . There are a plethora of doors . . . . . The place is ventilated upon the fresh-air principle, the ventilators opening by screw cantilevers operated at the stage side."

Edinburgh's New Asylum. AT a recent meeting of the Edinburgh and District Lunacy Board the clerk gave a report as to the expenditure on and position of the works with regard to Bangour Asylum, and a report by the Lunacy Board on the present plans. From this it appeared that the total amount paid to date was £85,674 19s. 10d. Further, it appeared that the total approximate estimate of the asylum for 600 patients was £263,230, and for 1,000 £376,840. Included in this total was a sum of £16,600 for architects' fees, and £10,000 for measurers' fees, &c. Attached to the report was a memorandum by the Medical Commissioners on the plans of the asylum. This memorandum stated that it appeared to the Commissioners that the plans showed throughout unnecessary costliness in matters of detail. Instances of this were too numerous to be individually specified, but examples were given, such as mullioned windows, crow-stepped gables, string courses, expensive mouldings, and stone balustrades serving no purpose. These seemed out of place in the buildings of a village asylum erected for poor people, and would add nothing to their efficiency as a means of caring for or curing the insane. Special attention was directed to the question of whether such buildings as the homes and supervision homes (of which there would be many) could not be so planned as to provide all the necessary accommodation at less cost. The various departments were criticised individually; and in dealing with the home for thirty-six quiet, chronic or industrial patients (estimated to cost £6,470, or £180 per bed) the Commissioners said it was to be regretted that the home for patients who needed the simplest arrangements for their care and comfort should be so expensive. A special meeting has been convened to discuss the report.

Kreuznach. KREUZNACH was, from the thirteenth to the fifteenth century, the capital of the county of Sponheim. It has now become a watering-place of considerable repute, some thousands of visitors flocking there annually, many of whom take the advantage of the salt-baths, which are particularly beneficial in cases of scrofula and cutaneous diseases. The castle of Kauzenberg, the ancient seat of the family of Sponheim, situated upon the summit at the north-west side of the town, commands a fine view of the valley of the Nähe from Rheingrafenstein to Bingen. A lion hewn in stone, brought from Schloss Dhami, the seat of a branch of the Wildgrafen and Rheingrafen, commemorates the gallant deed of a butcher of Kreuznach, one Michael Mort, who in 1279 sacrificed his life to save that of his prince, Johann von Sponheim, in a battle against Archbishop Werner, of Mayence. One of the most picturesque objects of interest is perhaps the old stone bridge, which unites the three different portions of the town, upon the buttresses of which several quaint old houses are built, illustrated on this page. Kreuznach is the birthplace and residence of the Cauers, who have made a world-renowned reputation as sculptors of considerable talent.



Old Bridge—Kreuznach—

Southport's Victoria Memorial. MR. GEORGE FRAMPTON, A.R.A., who has been commissioned to execute a statue of Queen Victoria for Southport, has prepared an interesting model for the inspection of the councillors of that borough. The Southport authorities have suggested a site for the statue which does not strike Mr. Frampton as the most suitable, and he has proposed an alternative scheme. The sculptor suggests that the statue shall be placed in the centre of an open space (approximately circular) in the midst of the gardens that border one side of the wide and important thoroughfare known as Lord Street, and he proposes, if the Town Council approves, to arrange this open space according to the plan indicated in his model. As a rule the sculptor—in England, at all events—has to make his monument fit in as best it can with all its all-too-often uncongenial surroundings, but according to the plan in Mr. Frampton's model Queen Victoria's statue would form the centre and keynote of a complete and harmonious scheme. The statue, with the seats round its base, is shown in the model standing in the centre of a circus about 180ft. in diameter. Round the outer rim of this space runs a wide pavement composed of sections of red bricks and white stone, and adorned with seats and lamps designed to effect the general harmony. Trees have an important part in the scheme, and their arrangement has been carefully planned in the model, every detail of which has been carried out with thoroughness in plaster and wax.

Yarmouth Old Town Wall. In order to widen Rampart Road and give a better and safer approach to the Northgate Board Schools, the Great Yarmouth Town Council has arranged with the charity trustees to acquire a strip of land that is bounded by part of the town wall; and to carry out its scheme of improvement the Council has assented to the demolition of that part of the old town wall which runs parallel with Rampart Road. This proposal is considered by the local archæologists a piece of gross vandalism. This wall was in process of building when the plague known as the Black Death ravaged the town in 1349. That visitation caused delay in its construction, and the wall was not completed till 1396. The old North Gates, according to tradition, were built by the persons who made money by the removal and the burial of the bodies of those who died from the Black Death. Dr. John Bately says that the portion threatened with destruction is in a very good state, faced with black flints, 4ft. wide at the top, about 8ft. in width at the foundation, and clear of any buildings. It is the longest stretch of the old town wall in existence that is not covered by any buildings, and as intact as any portion remaining in the borough. On the other hand, the North Ward representatives in the Council have declared that the wall is a dangerous and crumbling ruin, obstructing the passage both of air and light, constituting an eyesore and a nuisance, that they demanded that it should be removed. Dr. Bately says Yarmouth town wall is, with the exception of a point at St. Peter's Church, entire from end to end, and there are few towns of which this can be said. The only breaches in the wall are where the St. Nicholas Gate, the North and South Gates, and others, were removed, with the towers that enclosed the gates. Part of the wall has gone in the churchyard, but even there the foundations remain, and it is possible to view the wall from end to end. It is probable the matter will be brought before the Norfolk and Norwich Archæological Society.

The Emperor on Modern German Sculpture. At a banquet in Berlin last Wednesday, given in honour of the unveiling of the last of the historical groups in the Sieges Allee, the monument of the Elector John George, Emperor William made a speech dealing with modern German sculpture. His Majesty had invited all the sculptors to whom he had entrusted the design and execution of the Hohenzollern statues, as well as the Curators of the Berlin Museums and other guests. For the execution of his conception, his Majesty said he had put aside the plan of Committees of Selection and public competitions, and had adopted the direct method of commissioning artists in accordance with the approved manner of Classical times; and with the help of Reinhold Begas he had succeeded in getting together in Berlin a staff of artists capable of the work in hand. The utmost freedom had been given them, and the experiment had been successful. The Berlin School of Sculpture stood on a plane of splendour such as had scarcely been seen in the time of the Renaissance. Then continuing, the Emperor said: "Our sculpture stands before us to-day pure from modern tendencies. Do not give up the great principles of old. Art which thrusts itself beyond æsthetic laws is workshop art. The true artist does not require to be cried up on the market-place. The great masters of Greece, Italy and the Renaissance knew nothing of present-day newspaper advertisement. They worked as God gave them inspiration, and let people chatter as they pleased. The perception of the ugly and of the beautiful is the possession of every man. It is for the cultivation of this feeling in the nation that I need you. I thank you for having accomplished such work in the Sieges Allee. The impression which it exercises on strangers is stupendous. On all hands a deep respect for German sculpture is conspicuous."

Engineering Notes.

A New Pier Pavilion at Southport has been erected from plans by Mr. R. F. Freeman, of Bolton, by Messrs. W. H. Peters & Sons, builders, of Rochdale.

The Transporter Bridge at Newport, Mon.—Mr. Haynes, the borough engineer, will be associated with M. Arnodin in the construction of this bridge, which is estimated to cost £64,000.

The "Century" Buildings, St. Annes-on-the-Sea, have lately been fitted with the latest improved hot-water heating apparatus by Messrs. John King, Ltd., Liverpool, employing their latest improved Rahnee radiators and "Rex" radiator valves.

Electric Tramways at Newcastle.—The first car of the new overhead electric system of tramways in Newcastle was set running last week. The first rail was laid in May, 1900, and the system was estimated to cost £400,000, but the contemplated outlay has been more than doubled. There are twenty miles of double track, extending to all the suburbs. The tramways have been constructed under the direction of Mr. Le Rossignol, who has been appointed manager for the Corporation, to which the system belongs.

The Electric Lighting Boards Co. announce that their French representatives were able at three days' notice to instal the entire electric lighting system of the numerous stalls at the great Automobile Exhibition in the Grand Palais of the Champs Elysées, the number of lights applied in this limited time being no less than six thousand. This achievement is a remarkable one and beats any French time record, even including the company's rapid installations at Compiègne on the occasion of the Czar's visit.

"The Young Engineer and Amateur Carpenter."—We have received the second number of this new publication, which is issued from 56, Ludgate Hill, E.C., price 4d., monthly. The chief article is on the "Tuppeny" Tube, while other articles deal with pneumatic tools, electric cells (by Mr. Bottone), lathes, a cylinder electrical machine, a simple telephone, and home carpentry. The paper has an attractive appearance, and should meet with a generous approval among students and amateurs; but it is to be regretted that such an atrocious design for an overmantel as that shown on p. 65—just the kind of thing one sees in a cheap-Jack's saleroom—should be given as an example of good work.

The New York Tunnel.—It is asserted that the Pennsylvania Railway Company has nearly completed arrangements for the construction of a tunnel under New York City and under the East River to Long Island for the purpose of bringing Transatlantic passengers and freight landed at the eastern extremity of Long Island direct into New York and across the city ready for transference to the company's main lines without a change. It is said that when the tunnel is completed and proper docking facilities are constructed on Long Island the American line, which is closely connected with the Pennsylvania Railway, will stop their boats at Long Island. This will result in a saving of time, which is expected to force the British and German lines to do likewise. The ordinary Transatlantic journey will be reduced from Fire Island to New York to from four to six hours, and in case of night arrivals there will be a reduction of at least half a day.

A Scholarship for Iron and Steel Research.—A research scholarship or scholarships, of such value as may appear expedient to the Council of the Iron and Steel Institute from time to time, founded by Mr. Andrew Carnegie (vice-president), who has presented to the Iron and Steel Institute sixty-four one-thousand-dollar Pittsburg, Bessemer and Lake Erie Railroad Company 5 per cent. debenture bonds for the purpose, will be awarded annually, irrespective of sex or nationality, on the recommendation of the Council of the Institute. Candidates, who must be under thirty-five years of age, must apply on a special form before the end of March to the secretary of the Institute. The object of this scheme of scholarships is not to facilitate ordinary collegiate studies, but to enable students who have passed through a college curriculum or have been trained in industria establishments to conduct researches in the metallurgy of iron and steel and allied subjects with the view of aiding its advance or its application to industry. There is no restriction as to the place of research which may be selected, whether university, technical school, or works, provided it be properly equipped for the prosecution of metallurgical investigations. The appointment to a scholarship will be for one year, but the Council may at their discretion renew the scholarship for a further period instead of proceeding to a new election. The results of the research are to be communicated to the Iron and Steel Institute in the form of a paper to be submitted to the annual general meeting of members; and if the Council consider the paper to be of sufficient merit, the Andrew Carnegie Gold Medal shall be awarded to its author. Should the paper in any year not be of sufficient merit, the medal will not be awarded in that year.

BRICKLAYING AND TRADE-UNIONISM.

THE UNIONS REPLY.

The Management Committee of the General Federation of Trade Unions (including the Amalgamated Society of Engineers and the Navvies, Builders' Labourers' and General Labourers' Union) have published in the "Times" a "reply" to the statements made against them.

They deny that the practices alleged form any part of trade-unionism. "Trade-unionism seeks to promote the interests of labour by substituting collective for individual bargaining in the disposal of the labour of its members. It seeks to fix certain standard minimum conditions in regard to wages and hours, but it does not seek to beat all down to that level. As a matter of fact, it puts no embargo upon its members who may be inclined to get beyond the minimum conditions by special skill, aptitude or diligence. In all trade unions there are men who have risen from the ranks of manual workers and are filling responsible positions in life as architects, consulting engineers, manufacturers and publicists. Trade-unionism has rendered immense service to the community, inasmuch as it has prevented whole masses of workers being pressed down below the level of industrial efficiency.

"True, the unions oppose sweating of labour by unscrupulous employers, and resent their members being goaded to abnormal exertion beyond their strength and inconsistent with health and permanent efficiency.

"A great classic example of 'free labour' in this country is that of the agricultural labourer. The 'free' unorganised agriculturist has been for generations ground between the upper millstone of landlordism and the nether millstone of obsolete methods of production directly contributed to by his dependence and consequent cheapness of his labour. He has been reduced thereby to a condition of physical and mental starvation, yet agriculture languishes and no one gains as a result of the labourer's degradation. On the other hand, in such trades as engineering, shipbuilding, mining, &c., labour has by organization won for itself better conditions in regard to wages and hours, which betterment has led to the stimulation of invention and the introduction of machinery, with immense advantage to all engaged, as well as to the community. The statement, therefore, that the unions have prevented the introduction of labour-saving machinery or appliances is not only not true, but absolutely the reverse of the truth."

At the annual dinner of the Newcastle, Gateshead and District Building Trade Employers Association held at Newcastle on Wednesday last, Alderman Rankin, of Sunderland, said that in their district they were the first to put their finger on the evil of restricted labour. In going back through their books they found that six or seven years ago the men did at least a third more work than they were doing now. The men's associations said they had nothing of the sort on their books, but who would expect them to record such a resolution?

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Building against a Party Wall.

BISHOP AUCKLAND.—INTERESTED writes: "A half-brick wall divides the yards belonging respectively to A. and B. In the deeds of A.'s house no mention is made of the matter. B. built both houses and sold the one occupied by A. to him. B. now proposes to build a bakery, using the half-brick wall, but without asking A.'s permission. Is the wall in question a party wall?"

You should be able to ascertain whether the dividing wall between your yard and that of your neighbour is a party wall or not from the measurements and boundaries set out in the lease. In the circumstances stated, and assuming the deeds to afford no assistance, I am of the opinion that the law would presume the half-brick and the gable wall to be party walls. However, the question as to whether or not the wall is a party wall is one of small importance to you, because even granting it to be such, or even the sole property of the adjoining owner, yet you are perfectly entitled to build up against it any structure you like so long as you do not injure it, and subject, of course, to the remote possibility of the adjoining owner at any time removing the support of his wall in the event of his being the sole owner of it. The structure you contemplate is a very small one; and, save on the score of nuisance—*e.g.*, smoke—or by reason of restrictive covenants in your lease, I see no reason why you cannot build it in the manner you propose.

W. J-R.

The Building Trade.

NEWCASTLE-ON-TYNE.—TYNEDALE writes: "In which towns or districts in the country is the building trade supposed to be particularly active?"

The building trade throughout the country is depressed; and although many small urban localities are normal, or developing normally, the supply is fully equal to cope with the demand. Just at present the trade is particularly idle, and will be for some months, till the cold weather is over. The North is perhaps more depressed than the South.

Joinery Instructor under London School Board.

MANOR PARK.—INSTRUCTOR writes: "I am a joiner by trade and wish to be appointed under the London School Board as instructor. Kindly state what certificates I should need and what are the hours, remuneration, &c."

The conditions of appointment for instructor and assistant instructor in woodwork under the London School Board are: that the candidates must have passed the examination in Science Subject First-class No. 1 (Practical Plane and Solid Geometry), and obtained the full "D" certificate or equivalent, namely, Science Subject No. 2 (Machine Construction and Drawing) or Science Subject No. 3 (Building Construction). The salary for assistants is £80 per annum, with an annual increase of £5 to a maximum of £100. Instructors, £100 per annum, with annual increase of £5 to £155. Hours, 27½ per week, some of which may be in the evenings. The candidate must be thoroughly competent to teach woodwork—the certificate of the City and Guilds of London Institute, or a certificate in Sloyd will be accepted.

W. E. C.

Thickness of Masonry Dam.

MIDLANDS.—A BEGINNER writes: "Would the enclosed section (not reproduced) of a wall built in rough masonry with lime mortar be too much for a dam enclosing 25 yds. sq. of water averaging 6ft. deep?"

The surface area of the water enclosed by the dam has no influence upon the thickness of the wall, which is solely determined by the nature of the material and the depth of water to be sustained. Cement-mortar only should be used in building the masonry wall forming the dam, but if the work is already started and lime mortar has been used the inside face should be both built and rendered in cement. Taking the depth of water to be 6ft., the wall must be carried high enough above to prevent any wash over the top in high winds, say at least 18in. above the top water-level. The thickness at the top should be, say, 2ft. to 2ft. 6in., and the thickness at a depth of 6ft. below the surface of the water would vary according to the batter of the sides. If the side next the water were vertical and the other side battered (as Fig. 1) the thickness should be 4ft. 6in. If the side next the water were battered and the other side vertical (as Fig. 2) the thickness should be 7ft. If both sides were equally battered (as Fig. 3) the thickness should be 5ft. 6in. The nature of the foundation is not stated. The wall should be carried down to solid rock if possible, and every precaution taken to prevent leakage.

HENRY ADAMS.

Agreement not to Practice.

LONDON, S.W.—W. C. W. writes (but does not give his name) or address, which is quite contrary to our requirements): "When I entered a firm consisting of two brothers I signed an agreement not to start business on my own account within a certain radius. They have now dissolved partnership, the younger brother carrying on the business. Does the agreement now hold good, or is it void?"

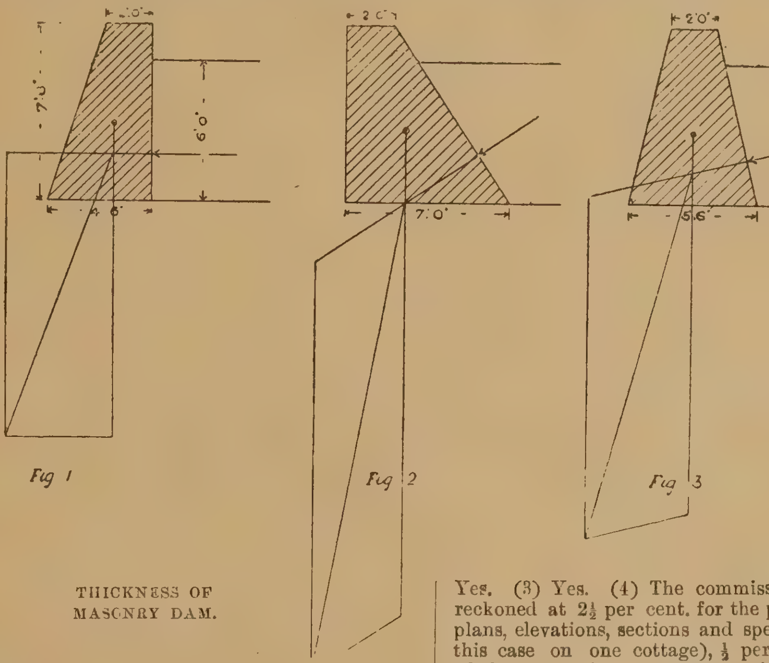

Fig 1 Fig 2 Fig 3

THICKNESS OF MASONRY DAM.

The agreement does not bind you. It has been several times decided that such an agreement made by employers with their servants when seeking a situation are void when out of their employ. Where, however, such agreements are made for monetary considerations, as where an architect sells his practice in a certain district, they are recognised as binding.

Liability for Damage to Weather-Cock.

GLOS.—STAPLETON writes: "The weather-cock on the turret of a new hotel has blown over about 5in. The contractor refuses to put it right, contending that he is not liable, as the weather-cock was selected by the architect and fixed according to his instructions. The conditions of the contract were those issued by the R.I.B.A., and include the usual clause for making good any defects, shrinkage or other faults which may appear within twelve months from the completion of the building. Is the contractor liable?"

If the contractor did not perform his part of the work in a proper manner, he is liable; if the architect was at fault, he is liable; and if the failure was due to neither, but accidental, neither is responsible, and the owner will have to repair the damage at his own expense.

Architect's Commission.

DUBLIN.—SUBSCRIBER writes: "An architect prepared some plans for cottages. As the local Town Commissioners were borrowing money to build them under the Labourers' Dwellings Act, he agreed to a remuneration of 2½ per cent. No legal agreement was made, but the matter was entered in the minute-book and signed by the chairman. Two years elapsed before the work was begun, the architect having in the meantime removed his office to a neighbouring town. When the work was well in hand the Commissioners received an intimation from the architect that 'owing to extra trouble, &c., for supervision, I could not accept less than 5 per cent. as my remuneration fee.' (1) Can the architect make any charge for plans, &c., in view of the fact that he has violated his own agreement? (2) Could he be compelled by law to fulfil his agreement? (3) If another architect were employed to superintend the work, would he be entitled to enforce the 'conditions of contract' signed by the former architect? (4) Is 2½ per cent. insufficient for this class of work—about twenty cottages are to be erected from one set of drawings?"

(1) The agreement, though verbal, is a legal one, and the architect can only claim what was agreed upon at first. He could move to Jerusalem if he liked after the agreement was made, but his clients have the right to insist upon his completing this part of the contract without extra payment for travelling expenses, &c. (2) Yes. (3) Yes. (4) The commission is usually reckoned at 2½ per cent. for the preparation of plans, elevations, sections and specifications (in this case on one cottage), ½ per cent. on the whole twenty for procuring tenders, and 2 per cent. on the whole twenty for supervision, &c. Travelling and out-of-pocket expenses are paid in addition.

Alabasters.

CARDIFF.—IONIC writes: "Where can I procure a good quality alabaster and spars in variety of colour?"

There are two kinds of alabaster, calcareous and gypseous. True or Oriental alabaster is a carbonate of lime, differing from marble in its formation, being produced by precipitation. The onyx marble of Mexico, largely used for decorative purposes, is an alabaster, and Algerian is well known. The name alabaster has also been given to massive gypsum, a hydrous sulphate of calcium, a stone much softer than calcareous alabaster; when highly crystalline and transparent, it is called Selenite, and when fibrous satin spar. The chief varieties of true alabaster are as follows:—Bianco; Cotognino; Giaccione; Onice; Nuvole; Occhi; Tartaruga; Sadonico; Pecorella; Fortezzino; Fiorito; Rosa; Dorato; and Palombara, from the foot of Monte Gennaro, near Rome; these names except the last refer to either the colours or their formation. All varieties of alabaster, marble and similar ornamental stones can be obtained through Messrs. Farmer & Brindley, of 63, Westminster Bridge Road, S.W.

New Patents.

These patents are open to opposition until January 27th, 1902.

1900.—Road-Roller Scarifier.—22,537. B. Asplen, 'Beverley," Southall. This scarifier may be fitted to the road roller or traction engine, or it may be mounted on a separate carriage. It consists of an outer and an inner casing of cast-iron or steel. The latter has a series of scarifying teeth at its lower end which can be adjusted by a central screw.

Calculating Slide Rules.—23,256. A. Forster, Bedeburn Park Road, Cowes, I.W. This is an engineering slide rule which combines scales so that "mean pressure," "diagram factor," "cylinder ratios," and other calculations, can be made with ease.

Self-locking Bolts.—22,938. F. F. Evans, 17, Coltsgate Hill, Ripon. This bolt, which is intended for joining two or more pieces of wood together (as in a roof), is hollow for the greater portion of its length, and is threaded inside and out. When two parts are to be joined, a hole is made in one, and a threaded cone is driven in. The bolt is then passed through the other part and screwed on to the cone, by which it is expanded and held fast. By turning it in the opposite direction, both the bolt and the cone can be removed.

1901.—Guard for Wood-working Machinery.—59. T., R. & W. Lees, all of Park Foundry, Hollinwood, near Oldham. The guard for covering the rotary cutters is fixed at the end of a swinging lever, which normally tends to descend. A disc is also attached to this lever, and rests on the wood whilst it is being worked. The parts are very neatly arranged.

Heating Buildings by Steam.—1,272. J. N. Russell, 109, High Road, Chiswick, London, W. Combined with the air-line services from the mains and radiators are valves so arranged that when the steam inlet is shut the air-line connection is open, and, *vice versa*, when the air-line connection is closed to the degree necessary to prevent waste of steam, the steam inlet is open. The invention is based essentially on the maintenance of a partial vacuum.

Wood-planing Machines.—2,309. J. & D. Sagar, Canal Works, Halifax. This invention relates to an attachment (for the feeding end of the machine) for use in pattern stripping, or planing boards to any angle, or wedge-shaped, so that any desired draft is secured with a minimum of adjustment, and without interfering with the usual parts of the machine.

The following specifications were published on Saturday last, and are open to opposition until February 4th, 1902.

1900.—19,367, Turner, traps for water-closets, sewers, &c. 22,139, Hatschek, slabs of artificial stone. 22,527, McGibbon, ventilating churches and other buildings. 22,666, Simpson & Thomlinson, automatically operating ventilators according to the temperature. 22,788, Doulton & Morris, joints for earthenware pipes or conduits. 23,718, Hewitt, cement kilns and drying chambers.

1901.—804, Lovering, draught and weather excluders for doors. 1,250, Harrison, fixing handles to doors, &c., with screws. 1,251, Walton, adjustable strut for trenching. 1,273, Russell, heating buildings by steam. 1,327, Collins, drain-testing appliances. 1,420, Lewis, window sashes and frames. 1,693, Roovers, water heaters for baths. 1,920, Moore, casement windows. 2,252, Hopkinson, J. Hopkinson & Co., Ltd., & Lowis, valve seats. 2,628, Russell, jib cranes. 2,800 Harvey, sheet-metal knobs and terminals. 3,004, Tourtel, locks. 3,674, Penotti, shower baths. 5,423, Leibow & Maitinsky, steam-heating apparatus. 7,670, Westley & Slater, draught, rain and dust excluder. 12,498, Scott, street-cleansing or scavenging apparatus. 17,555, Francke, non-conducting material for steam pipes, &c. 18,612, Lovekin, tools for expanding and flanging the ends of pipes. 20,060, Castle, shower-bath apparatus. 20,439, Dachsel & Finke, stench-traps. 20,891, Höyer-Ellefsen, fireproof floors.

Law Cases.

Remarkable Case of Libel against two Birmingham Architects.—The case of *Charles & Forbes* v. *Lloyd* was heard last week in the Nisi Prius Court at the Birmingham Assizes. This was an action for libel brought by Edward John Charles and James Edward Forbes, architects, carrying on business together, against Frederick William Lloyd, another Birmingham architect. Briefly, the allegation against the plaintiffs was that they dishonestly possessed themselves of Mr. Lloyd's plans and ideas for developing the site on which the Theatre Royal stands, and put them forward as their own. Among the gentlemen who took up the scheme was Mr. F. S. Bolton, who approached Mr. Charles on the matter. In 1900 Mr. Bolton's offer for the site was accepted, and he asked Mr. Charles to draw up more complete plans than he had then done. A plan was published in the "Birmingham Daily Mail," upon which defendant alleged that Mr. Charles, in the design which he had elaborated with Mr. Forbes, had stolen his (defendant's) ideas. The action was not brought to recover damages, but merely to clear the character of the plaintiffs from the aspersion that had been cast upon it. The first of the alleged libels appeared in a letter in which the defendant, writing to Mr. Bolton, stated: "You will have no difficulty in discovering that, no doubt unknown to you, your architect and builder have practically appropriated in its entirety my scheme." The second libel complained of appeared in a letter to an evening contemporary, in which the defendant asked that the line drawing of the plan prepared by him in July, 1899, and submitted to Mr. Bolton in July, 1900, might be published, the writer adding: "Upon comparing this with the plans published by Messrs. Charles & Forbes, a marvellous and striking resemblance in the arrangements will be discovered." Several prominent architects were called for the defendant to testify to the similarity of the plans in dispute. One gentleman said he had never seen two from different people that showed so great a similarity. Another described one plan as "practically a facsimile of the other." Mr. Justice Kennedy, in summing up, stated that the plaintiffs were suing practically for injury to themselves. They said that what had been written to Mr. Bolton and to the press was libellous and defamatory. What was the meaning of the letter written to Mr. Bolton before the defendant had made any enquiry of the plaintiffs? What would they think of any professional man who appropriated for his own advantage the brain-work of another? Was a statement suggesting that defamatory or not? If it was defamatory there was no justification. If the jury thought there was an imputation meaning that defendant accused plaintiffs of having appropriated that which was his, it was for them to say whether it ought not to be a matter for such reasonable —not vindictive—damages as would show that in their opinion it was a charge which ought never to have been made, and for which an apology ought to have been offered in the most open manner unless the writer was prepared to justify it.—The jury returned a verdict for the plaintiffs, awarding Mr. Charles £50 damages and Mr. Forbes £25.

Lowering a Road.—At the Birmingham Autumn Assizes last week a case was heard in which Mr. Jonathan Ellis, architect and surveyor, of Walsall, sought to obtain an injunction to restrain Mr. A. A. Buchanan and others, also of Walsall, from lowering, obstructing or otherwise interfering with the roads on the south side of the plaintiff's land so as to make access and egress to his house and grounds less commodious. It appeared that in 1884 the plaintiff rented a piece of land near Buchanan Road for a term of ninety-nine years, erected a house upon it and laid out gardens and carriage roads, and it was contended that the defendants in May last lowered the road adjoining the south side of the house to the extent of 3ft. By this action plaintiff alleged that the value of the house had depreciated, and the wall would require rebuilding, as it had been damaged by the excavations, while access to the house had been rendered more difficult. Defendants, on the other hand, contended that they had made the road according to the requirements of the local authority, by whom the plans were passed. They denied that they intended to interfere in any way with the plaintiff's property, and stated that while denying legal liability they had offered to make all necessary alterations to the plaintiff's drives and walks, and put in the necessary underpinning to the walls referred to. After a good deal of evidence had been given on both sides, Mr. Justice Bigham said the plaintiff should succeed in this action, as when he leased the land he did not contemplate the making of the new road, which would have the effect of pulling down the property which he had covenanted to build. The road was not required by the plaintiff, but was made by the defendants for their own advantage. He accordingly gave judgment for the plaintiff for £75, with £25 costs, and for the defendants on their counterclaim of £29 8s. for rent.

Temporary Structures in Westminster.—In the King's Bench Division of the High Court of Justice last week the case of the *Mayor, &c., of Westminster* v. *The London County Council* was heard. This came before the court upon a special case stated with a view of raising the question whether the County Council or the Corporation of Westminster was the proper authority to lay down conditions for (and to sanction) the construction of wooden structures erected for the accommodation of spectators at public functions taking place within the area of the city of Westminster. The Lord Chief Justice, in delivering judgment, said in his opinion the broad question should be decided in favour of the Corporation of the city of Westminster. The court did not propose to answer the third question as to the supervision of the district surveyor, as to do so would, they thought, lead to difficulties. They thought, however, the Corporation of Westminster was the authority which had the right to exercise the powers of section 84 of the London Building Act. The other judges concurred.

Welsbach Infringements.—In the King's Bench Division of the High Court of Justice last Thursday the case of *The Welsbach Incandescent Gas Light Co.* v. *Parkes* was heard. This was the first of thirty cases of this character. The plaintiff company asked for injunctions restraining the defendants from selling infringements of the plaintiffs' mantles, also for an enquiry before the Official Referee as to damages and costs. The court made the orders asked for in all the cases.

THE POLYTECHNIC CLASSES.

The prize distribution in connection with the above classes was the occasion of a crowded gathering at the large hall in Regent Street on Wednesday evening last. The chair was occupied by Mr. Thomas Blashill, F.R.I.B.A., and the presentations were made by Mr. Edmund Bulnois, M.P., Mayor of Marylebone.

The Polytechnic Director of Education, Mr. Robert Mitchell, in introducing the chairman, referred to the long list of successes of the "Poly" students. As an example of what was now being done, he mentioned that out of the seven silver medals just presented by the Royal Academy four had been gained by students at these classes. The chairman, in his introductory remarks, expressed the opinion that English engineers were quite competent to hold their own against those of other countries. To the students of architecture he would say that, although, as in most other professions, it was necessary to extend their study to embrace other arts bearing upon it, he would advise them to take up one particular branch and master that thoroughly. He advised them also to cultivate the faculty of observation, and to form an opinion upon every building they saw. Having distributed the prizes and certificates to over 200 students, Mr. Bulnois, M.P., said he could assure them that the Borough Council of Marylebone took a deep interest in the institution, and, like himself, were very pleased with the result of the examinations. Mr. C. Hawksley, president of the Institution of Civil Engineers, also gave a short address in which he said, as architects were considered to beautify the earth, engineers were believed to "uglify" it, but he hoped that by and bye the one would learn from the other, and everything would be in harmony. The prize distribution was followed by an entertainment.

BUILDING CONSTRUCTION.

(Continued from p. 319, No. 358.)

61. I asked my foreman mason, William Geraghty, to sketch for me a piece of *raked rubble* face. I give his sketch (Fig. 86). It shows very clearly what is meant, but it is not a *picture* of raked rubble; the joints are too clear and distinct; in the actual work the face would not be nearly so clean and tidy, because this particular masonry is to be left rough—surplus mortar being lightly raked off with the edge of the trowel, to give a good hold to the plaster and rough-cast. I find raked rubble quoted in "Smith's Builders' Prices and Memoranda," a small book, written by a practical man—a successful contractor—published in Belfast in 1863.

Owing to the variety of sizes of stones worked up, there is very little "waste" of the stone quarried. There need not be any through bonds; where the end of a three-quarter bond approaches the second face, it is made up with small stuff, which is better in this place than a "shiner" would be. The work is stronger than a wall built with close joints in one face and spauled work in the other face. It is bad work when it is built with bad mortar; it is the strongest kind of masonry when built with Portland-cement mortar of the proper kind great care being taken to have the stones clean on their surfaces, the best kind of clean surface being a fresh fracture.

If I appear to fail to take account of the chemical composition of mortar, stones, &c., methods of quarrying, &c., the student must not think that these matters are not present to my mind; they will be dealt with all in good time. My present business is with the work to a particular class of house as seen by a man of an observant habit, present at the work. The student will be more interested, by-and-by, to learn about the origin and composition of materials after he has made some way in the knowledge of their uses, and when they have become familiar objects to his mind, answering to their names.

Assuming that sand, lime and stones are delivered on the ground, there ought to be 3 labourers, to make mortar and "attend" with mortar and stones, to 2 skilled masons (in this proportion). The scaffolding for this work will be formed with casks and deals (12ft. by 9in. by 3in.). The number of casks (petroleum casks) and deals required will depend upon the number of men employed; for two masons, eight casks and fourteen deals will probably be enough; four additional deals will be required to make a small gangway (for a gangway the deals will be united in pairs by small bars 2in. by 1in., nailed across them about 20in. to 2ft. apart, giving foothold).

62. *To make mortar.*—(*a*) Take, say, fourteen loads of clean sharp sand (the mason will know whether the sand needs screening; in many cases no screening is required for this kind of masonry), at 18 bushels to the load (252 bushels, or, say, 307 cub. ft.); lay this down on clean ground, pavement, old macadamised carway, or if necessary a planking, not on soil which may become mixed up with the mortar; form it so that there will be a central floor with a fence-like border. Place on this floor 84 bushels of good suitable lime, and regulate the lime to have a level top. The lime is now slaked; pour the water upon it out of buckets. If the water is sprinkled over the lime the top layer may slake, producing flour and filling up the openings, so that the bottom layers are protected, and they will be imperfectly slaked. It is advisable to begin at the outer edge and to proceed spirally to the centre; each bucket of water is to be applied to the area for which it will suffice; and as the work of slaking is carried in towards the centre the slaked surface is covered with sand; finally the whole heap is covered with sand. The next day it may be tossed. "Tossing" is to shovel the heap two or three times to and fro so as to evenly mix the sand and lime. Some water should be added as may be necessary to, say, half-wet the mixture. It should be allowed to stand for two weeks as tossed, when it will be fit for tempering and to be carried to the masons. "Tempering" means working with a shovel (adding water if necessary) to the proper condition. As a rule, especially in contract work, we do not get the mortar quite so rich in lime as this; but a common specification is 1 of lime to 3 of sand. This quantity will build from 45 to 50 cub. yds. of masonry.

(*b*) Another way is to run the lime to putty. The sand is spread as already described, forming a floor with a fence-like margin: a wooden cistern about 4ft. by 3ft. by 18in., leaving a square hole cut in the middle of one end 6in. by 6in. close to the bottom, having two or three 1½in. iron bars across it to form a grating, and having a sliding shutter to close it on the inside. The top of this shutter should stand higher than the end of the cistern. The cistern is mounted on the sand rampart, so that the thin milk of lime will flow on to the floor when the shutter is raised. Water is filled into the cistern from time to time; the unslaked lime is thrown into the water, where it slakes with some commotion, giving off steam; the contents of the cistern are kept well stirred, and from time to time the sluice or shutter is raised to allow the milk-like fluid to run to the sand. Any unburnt pieces of limestone are retained in the cistern, to be cleared out from time to time. For small jobs it is quite a common plan to slake the lime in one or more casks, pouring the milk off from the top as it is formed. When the lime has been "run," and when the putty has become moderately firm, it is covered over with sand, and after a day or two it is tossed as already described, and allowed to stand for a fortnight to "sour." The lime may be slaked and the mortar souring before the full number of masons are on the job. While some of the labourers are carrying out the foreman's instructions in regard to this work, the first course of headers may be put into the foundation trenches, the stones brought from the quarry may be gone over, quoins picked out and rough dressed, &c.

63. *Cost of a Cubic Yard*:—

	s.	d.
1¾ bushels of lime - - - - -	1	6
5¼ „ „ sand - - - - -	0	8
1¾ tons of stones, at 3s. - - - -	5	3
Mason, ⅝ths of a day, at 6s. - - - -	3	9
Labourer, $\frac{15}{16}$ths of a day, at 2s. 6d., say -	2	6
	13	8

A rough-and-ready way of dealing with the openings in estimating is to measure them in for workmanship and deduct them for material. (It will be found necessary to use the punch in dressing the quoins.) I assume for the present that the window-sills, door-sills, and blocks and steps are bought ready-dressed, or these may be all made of Portland-cement concrete.

The stones brought from the quarry "stock" are laid down, and spread out as much as they conveniently can be, to facilitate picking out quoins and borders—special stones. Stones are carried to the work on handbarrows, and handbarrows cannot be moved up ladders when the work rises to a height which requires scaffolding The scaffold is reached from the ground by a gangway. Mortar may be carried in a *box* barrow. The old-fashioned hod is convenient for taking mortar or bricks up a ladder on a man's shoulder; but, except for very small jobs, it is found more convenient to rig up a pulley and haul up the materials with a rope. In circumstances where a gangway is not advisable a hod may be found convenient on a small scaffold where there is not room to work a *box* barrow. Cheap buckets of galvanized iron (zinced buckets) are found useful for distributing mortar; they have not a long life, being hammered against the mortar-board every time to shake out the mortar.

64. *Portland-cement concrete work.*—Thesand and other materials used with Portland cement should be free from any clayey particles, and their surfaces should be clean. It is usual to specify proportions as 1 of cement to 3, 4, 5 or 6 of other things. A question which deserves more consideration than it receives is that of the variation of sizes of fragments in the materials used. Suppose we take a quart measure full of No. 1 sportsman's shot and fill the interstices with water, measuring the quantity of water needed: again take the same quart measure filled with a smaller shot, say No. 8, and again fill up with water; it will be found that there is not much difference in the quantity of water in the two experiments. But if we intimately mix No. 1 with No. 8, we shall find that much less water will be required. Anyone can see that there is considerable economy in using "displacers" (large stones embedded in concrete); if we could graduate the sizes of the pieces from the smallest grain of sand up to the

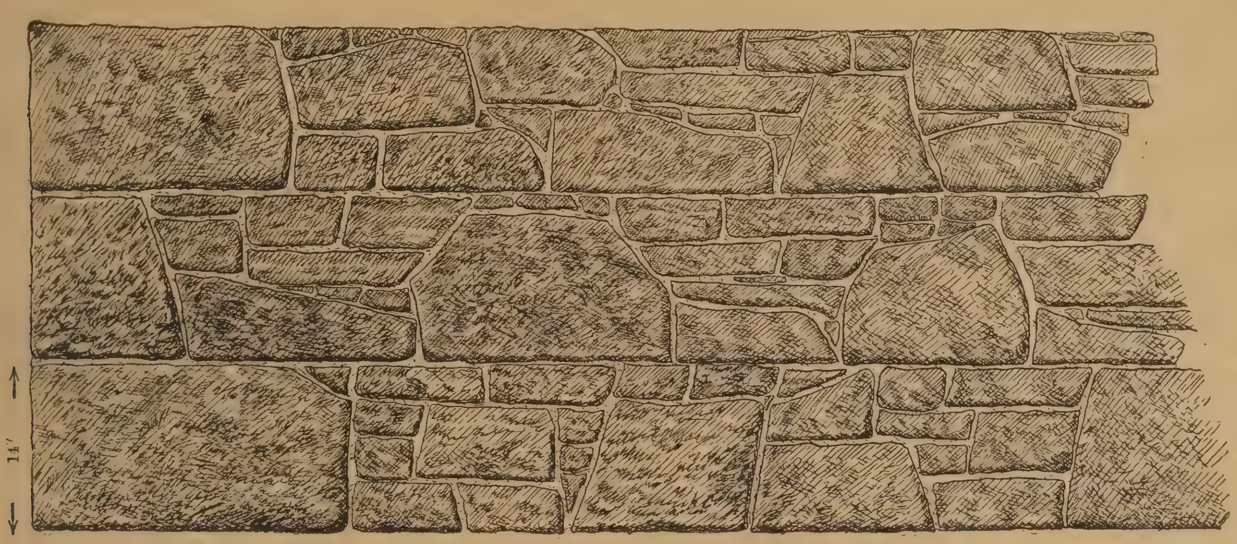

Fig. 86.

largest displacer, there would be considerable economy.

The combination of various-sized fragments, including the sand, is called the *aggregate*; the aggregate for the quantity to be wetted at a time is spread on a platform of planks or other clean floor, about 9in. thick; the *complement* of cement is spread on top, and the whole mass is tossed, say, by two men right and left, and then to the centre. This is repeated as often as may be necessary to incorporate evenly the whole of the ingredients. Water is now added, preferably through the rose of a watering can, but mostly without regard to this refinement; the important thing really is to keep the mixture moving while it is wet. The concrete must be just wet enough and not drowned.

65. *Chimney Flues and Stacks.*—If the lime of the district is fairly hydraulic, the flues may be built up round the drums (Fig. 84), keeping say, 1in. thick of mortar next the drum, giving the drum a slight twist by the handle from time to time, and lifting it up as the gable rises. It is, however, important that the flue shall be fairly close, so that soot will not spread from it through the wall, and in most cases it will be advisable to use either Portland-cement mortar or flue-linings (Fig. 85, previous article). The work may proceed, the flues being worked in the wall up to a little over the top of the collar-brace shown. At this level the stack may begin. The flues have been worked into line; they are 9in. in diameter, the thickness between is 4in. at thinnest. The box for the concrete mould will be 44in. long and 18in. wide, inside dimensions; it should be formed in four parts, each 9in. deep; they should be made to come apart at the corners, notched and pinned. Make them of 2in. stuff, planed smooth on the inside faces and jointed on the edges. Two portions of boxes can be made to serve, but the work will in that case have to be waited upon; with four portions the chimney may be completed in two days. Some of the lower parts will be removed and placed above (making an obvious provision for the projecting fillet). The flue drums (three of them) are kept moving up, and the parts of the box are only added as the work proceeds. Probably the best coating to be applied to the surface of the box, to prevent the concrete sticking to it, is a light coat of common lime whitewash: this does not interfere with the cement to prevent its floating well, as oil does. Some fine cement-mortar should be specially made to place next the timber. Three flue-linings should be placed at the top to serve for chimney-pots. If this has been carefully done, on the third day the whole of the boxing may be removed and the surface smoothed off, using a small wooden *float*, mending any small defects (and making up) with cement-mortar. This is a better plan than to work the concrete with a rough surface and afterwards to plaster the surface: it is much more economical. Care must be taken in working the chimney-stack to leave a raglet for cover flashing, as described later. The wall of the piggery yard has been built in cement-mortar. It will also be well to face the inside of the stye for, say, 3ft. with cement-mortar. The working of the half-round concrete-coping on the piggery yard-wall will be done with the assistance of three or four half discs set up on the wall and a straight edge; it should be floated off without any delay, because any second skimming will peel off and spoil the job. It should be a general rule to finish all concrete surfaces while the mass is still "green," so that the surface shall be part of the mass. We cannot afford the expense of tiles for floors, and, consequently, we shall have concrete floors in kitchen, shed, piggery (stye and yard) and privy; the privy pit shall also be formed in concrete. For dryness I advise that the surface under the wood floors of the bedrooms shall be concreted. I have already assumed that the door sills for outside doors are of dressed stone, and that they are set in the masonry at the proper level, which should only be done at the end of the masonry job. The greatest possible care must be taken to see that the ground on which we are about to place the concrete is properly consolidated. All filled parts must be well punned (or rammed) in layers. The surface should be covered with the chips and waste of the stones brought from the quarry, hand-packing the larger pieces, placing them with their largest face down and points up, filling in with smaller, so that there shall be a "bottomed" surface 3in. lower than the finished surface of the floors. In the bedrooms it shall be at a level 4¼in. lower to allow for the thickness of the wood floor. On this surface shall be placed the concrete. Straight pieces of timber, to serve the same purpose as plasterers' screeds, are bedded, so as to have their upper edge in the plane of the floor, and between these the concrete is worked to a level surface, using a straight edge. The surface is finished smooth with special fine stuff richer in cement than the general mass, but it should not be of the nature of a skimming; it should belong to the general body of the concrete. The floor of the shed should fall moderately to the paving. The piggery floor should fall to the doors with sufficient slope; this floor should be grooved on the surface to allow the moisture to drain underneath the straw and to give the pigs foothold. The privy pit shall be surfaced in the same way as the concrete floor. The hearths shall be of smooth cement-concrete. The concreting of the bedroom floors need not be finished so smooth as ordinary floor-concrete.

66. The plans (see previous article) show no drainage (or sewerage). It may be assumed that not far from the privy and piggery there is a receptacle—it may be a shallow pit in the ground—for manure, and that ashes and refuse will be carried to this place. The shed may be for the small supply of fuel for immediate needs, and it may be used for washing; it will be well to have a paved open channel from this paving to the refuse- or manure-pit. A Portunna labourer may have a small turf stack; a house for fuel is not within his reach. Better not enquire too narrowly how a man and his wife and a family of sons and daughters manage in two bedrooms. The arrangement is enormously in advance of the Connemara cabin. It will be advisable for the labourer to provide two or three petroleum casks. Place them on rough stands, shorten the down spoutings, and catch the rainwater from the roofs.

67. *Cost of Concrete.*—The cost of the mould for chimney-stack will be about 25s.; but this mould will answer for a large number of chimneys. The size of the stack is roughly 3·66ft. × 1·5ft. × 6ft. = 33 cub. ft. (including flues) = 1¼ cub. yds. A mason and labourer should put up this stack and finish it completely in two days' time.

	£	s.	d.
Say, 35 bushels aggregate, say, two tons at 3s. - - - - - - -	0	6	0
6 bushels of cement at 2s. 6d. - - -	0	15	0
Labour - - - - - - - -	0	17	0
Proportion for mould, say - - -	0	3	0
	£2	1	0

The bulk of concrete which given quantities of materials will make depends upon how they are measured; if broken stones, gravel and sand are measured separately, they measure very differently from what they will do after being mixed, because the smaller sizes fill up the interstices, as I have already explained. Above, they are supposed to be measured separately at the same price per ton. Let us suppose that the materials are such as that 12 bushels of broken stones, 8 bushels of gravel and 5 bushels of sand will, with 4 bushels of Portland cement, make 1 cub. yd. of concrete, taking 22⅛ bushels to a cubic yard; it will cost:—

	s.	d.
Broken stones - - - - - - - -	2	0
Gravel - - - - - - - - -	1	6
Sand - - - - - - - - -	0	10
Cement - - - - - - - -	10	0
	14	4

The sites for the floors being prepared, as I have described, with the highest points within 3in. of the floor level, the floors will take 4in. thick of concrete—that is, a cubic yard will cover 9 sq. yds., say 1s. 7d. a yard. A skilled tradesman and two labourers will finish 12yds. in a day at a cost of, say, 10s.: roughly, say, 2s. 5d. a yard for labour and materials (add to this the cost of bottoming). These are rough estimates, but they indicate the way in which accurate estimates may be arrived at. The materials available should be measured in the proportions supposed to be suitable, then mixed and re-measured; the cement should then be added, and the resulting wet concrete should be measured. In no department is there more looseness of specification than in this department of concrete, and in no department do contractors more frequently get the better of architects and engineers.

In these matters I am not above being checked and criticised; they are the things as to which practical men should compare experiences which must vary for different localities. But there are various kinds of critics. The kind of critic to whom I appeal is one in sympathy with myself, and not the man who is proud that he has found tripping this man who writes and professes to know everything. On the much discussed question, Theory against Practice, I have a word or two to say. The man who does his routine work unthinkingly may do work within narrow limits well, as the old kind of nail-maker or pin-maker did it; he is the extreme case of a practical man. Mr. Gladstone described a man who was so fastidious about his language—to have it in absolutely perfect form—that he reached a stage when he ceased to speak or write altogether; this is a still more extreme case of a theorist. In one important direction mere book-work fails. It does not give the proportions (of importance) of facts and operations to one another. In practice the importance of facts and operations is impressed by frequent recurrence of the operations and frequent penalties for ignorance.

(*To be continued.*)

HOW STONEHENGE WAS ERECTED.

AT a meeting of the Society of Antiquaries of London held on Thursday last, Mr. W. Gowland read a paper on "Excavations at Stonehenge." He assured them that the leaning-stone had been made safe, he believed for all time. The excavation was carried down to a depth of 8ft. 3in. below the datum line. With regard to the stone tools which had been discovered, he said it was evident that they were not used only for roughly breaking the rude blocks into regular forms, but also for working down their faces to a level or curved surface. They could, he thought, be legitimately assigned to the Neolithic age. The excavations had yielded sufficient to make clear generally the manner in which the operations of working and erecting the stones were carried out, but they threw little light on the transport of the blocks. For the solution of that problem they had to turn to the examples of similar work in countries such as Japan. He went on to describe the manner in which the blocks were set up and secured in their foundations. As to the most massive stones in the structure, the recumbent stone and the hitherto leaning-stone, which formed the piers of the central and the greatest of the trilithons, the excavations had afforded clear and conclusive evidence. The foundations were prepared by cutting away the chalk rock in such a manner as to form a hole between 8ft. and 10ft. deep, leaving an almost perpendicular face on the south-west side to form a buttress against which the back of the stone was to rest. From the bottom of the hole an inclined plane of rock sloping down from the interior of the enclosure was apparently cut. Both the rubble and chalk were also dug away for a considerable distance north-west, and to a depth of 4ft. on the south-west. The hole was then filled to a depth of 3ft. or 4ft., with white chalk rubble to form a layer in which to embed the pointed base of the stone and thus afford greater stability to it. The stone was then slid into the hole and gradually raised into a vertical position by means of levers and ropes. As the stone was being raised it was packed up with logs of timber and probably with blocks of stone placed beneath it. After its upper end had reached a certain elevation, ropes were attached to it, and it was then hauled into a vertical position so that its back rested against the face of the chalk. Two blocks of sarsen were afterwards placed under the oblique side of the base; the excavation was filled in with rubble. The purpose for which Stonehenge was erected was not a sepulchre but a place of sanctity, dedicated to the worship of the sun.

Maidstone was first lighted by Electricity last Thursday. The installation has been carried out by the Corporation at a cost of about £40,000,

SOCIETY OF ARCHITECTS.

HAMMERED IRONWORK.

By W. HÖFLER.

A MEETING of the Society of Architects was held on Thursday last at St. James's Hall, Piccadilly, the chair being occupied by Mr. Silvanus Trevail, J.P., who announced it his pleasant duty to present the Gold Medal of the Society to Mr. Walter Emden, L.C.C., for his services as president.

The following elections took place :—As Hon. Members : S. W. Kershaw, M.A., E. J. Naldrett, H. H. Richardson ; all of London. As Members : A. Laurence Cox (Folkestone), F. Victor Forrest (London, E.C.), R. Guy Kirkby (Sunderland); W. Harold Watson (Wakefield). As Students : Norman Harvey (Maidstone), Edwin Rothwell (Manchester).

Mr. W. Höfler then read a paper on "Hammered Ironwork" (with demonstrations by Mr. Ashford) as follows :—

FRITHWOOD HOUSE, NORTHWOOD. MERVYN E. MACARTNEY, ARCHITECT. (*See p.* 330.)

Whenever I watch an art-smith at work I am reminded of the old northern legend of

Wieland the Smith,

who was seized by King Envy and made to forge arms and armour by means of which the king might extend his realm ; and as the smith must work unfettered and yet not be able to escape, the tendons of his feet were cut, but the spirit of liberty was so strong within him that necessity taught him how to forge wings for himself, by which means he escaped and took vengeance on his captor.

It seems to me as if every art-smith had imbibed some of Wieland's feelings ; and the peculiar poetry in ironwork is no doubt arising from the fact that the worker must, so to say, fight against the stubborn resistance of the material which he has to get under control in order to accomplish his task. It is this supposition, this contrast which exists between the finished work and the violence of the strokes of the hammer, by means of which these graceful forms have been produced, which give the work its charm.

In the Olden Days.

The well-known truth that nothing really worth having is ever obtained without difficulties applies with special force to the smith's craft. The more difficult his work, the more the clever smith likes it, and the more of his individuality he puts into it. If the works of art in iron of the eleventh to the eighteenth centuries inspire us with so much admiration, it is partly on account of the strong individuality due to the difficulties originating from the very clumsiness and imperfection of the tools which the artists of that period had at their disposal. Just think that when the worker of these past ages wanted a nail he had to forge it himself, and that he had to take a rough bar of iron to produce not only his piece of art-metal work but often also the very tools with which to do the work.

How often have their patience and their passionate taste been sorely tried by all these material difficulties, which might have caused the less audacious to fail in their attempts ! All these drawbacks have disappeared in our days. The raw material undergoes tranformation which science pursues without interruption. Mechanical tools prepare or finish that which, as I just said, the worker of bygone days had to create himself. Bar iron, sheet iron, the various kinds of steel, nails, screws, &c.—all are manufactured with a view to the most economical application. I am, of course, far from condemning progress which brings us so many advantages and benefits ; but I cannot help saying, and I am sure I am neither too severe nor unjust in saying it, that it is decidedly detrimental to art-metal work in general. It has caused the number of real art-metal workers to diminish sensibly, and the art of the forge is seriously cultivated only by a few amongst them. For the art-smith's work is indeed a complex and difficult art. It requires of him who practises it a great knowledge of design and decoration, and a special experience which can only be gained in the course of many years. And the artist who has re-discovered the art of the ancients keeps it with jealous care.

A New Era.

However, a new era seems now to dawn. The architects in particular, and *all* men of taste who fully understand the artistic resources of the craft which occupies us, endeavour to allot an increasingly large place to ornamental ironwork in interior and exterior decoration.

I think there is a noble mission to fulfil. On the one hand, to strengthen and support the actual movement in favour of the employment of art-metal work by demonstrating its vast possibilities for rich ornamentation and its numerous applications ; on the other hand, to help its renovation and its extension by a short survey of the principal elements of knowledge which are necessary to a good art-smith.

As the native of a country (Austria) where there are so many useful State-aided institutions, I cannot help thinking that in England, too,- much good might be done by imitating the example, for instance, of Belgium, where the famous railings in the Place des Sablous, at Brussels, have been ordered by the State, the same being the case with the chancel rails in the Votive Church, Vienna.

It is certain that no smith can be called a good one unless he possesses that artistic intuition, that natural talent, with which every art-worker ought to be endowed. The boldness, the finish, and the beauty of his work are based to a great extent on that inborn skill, that natural cleverness, which experience alone, even combined with continuous practice, cannot give to those who do not possess it. As, however, many great men have held that genius is, after all, nothing else but the power of steady application to the one object which they had determined to master, much can be done by closely studying the various elements which combine to make up the science of art-metal work. They are : Designing, knowledge of material and tools, and practical skill in the various branches of the smith's work, which are forging, welding, embossing, mounting and finishing.

Design.

In speaking of design I do not intend to dwell on the subject of the history of art-metal work, as this would bring me to the almost inexhaustible subject of styles and periods, which has been treated by infinitely more competent speakers and writers than I am. I will only say that the main object in designing wrought-iron work is to obtain a pleasing original effect by means of graceful lines and curves, coupled with practical knowledge of construction which tends to produce an artistic object without superfluous expenditure. And you will, I hope, agree with me when I say that hardly any other material lends itself so well to absolute freedom of treatment in the interpretation of elegant and yet simple ideas. Even in England, which undoubtedly has taken the lead in sound ideas on artistic taste, the time is not very long past where such toy-things as imitation roses, spider webs, lizards, and many other naturalistic copies in iron, found great favour with the so-called "art-loving" public. The much-abused "art nouveau" (the "modern style") may have on its conscience a great deal that is unpalatable to the truly æsthetic, but surely it has the invaluable merit of having given the death-blow to all those weak and childish productions. The nineteenth century, with its astounding display of energy;

is surely none the less to be respected from an artistic point of view for having endeavoured to endow the future with an art which answers our reformed tastes and requirements, and the origin of this surprisingly sudden movement seems to be found in the complete transformation of the whole machinery of production.

The development of mechanical science during the past century has forced us to create certain objects the want of which had not made itself felt before. But just as in no previous centuries the transformation to entirely new art principles, even under the guiding influence of the greatest reformers, has been quite abrupt, so also now we find in the architecture of the most modern objects many lines which had already previously been employed, and which bear witness to the everlasting and real power of all that has been created by the great artists of old. We only wish to discard the pedantic attention to

Superfluous Ornamentation,

and seek beauty in rational application and treatment of the *material*. In my business experience I have noticed with much pleasure that of late years the demand for the so-called "armour-bright" ironwork has greatly increased, because this is the finish which, in the measure in which it leaves visible all the special features of the various processes of hammering, welding, embossing, and so forth, shows the natural beauties of the material—viz., iron—to the best advantage. Black iron stands next for artistic merit, but this black colour, which is obtained either through burning oil on to it or through painting it with "Dull Berlin Ivory Black," is really like painting iron with various colours or gilding, bronzing it, &c., a makeshift necessitated through the tendency of iron to rust when left unprotected. I have recently heard of a process whereby iron is said to be efficiently protected against rust by means of a metallic coating which in no way changes the natural grey colour of armour-bright iron; and it is sincerely to be hoped that this is not merely the delusion of a sanguine inventor's scheming brain.

As regards the architect's position in the matter of designs of art-metal work, I hope you will pardon my saying that I have not found these always quite practical. Junctions are frequently shown where it is impossible for a smith to weld, which induces pinning or riveting, neither of which are satisfactory to the conscientious smith. One of the great charms of mediæval ironwork is the utter absence of forced treatment, and it is this which raises the controversy as to who made the designs for these works, the architect or the smith. With all the varied duties and sometimes heavy anxieties which the architect has to bear, I should say that he will very often be glad to leave the task of carrying out the design of the art-metal work in the hands of the specialist.

Let us now proceed to the next section of our programme:

Knowledge of Material.

When you enter the smithy and you see the worker strike the piece of iron, you are put at once before the problem why the piece of iron yields which is to be worked, and not the hammer which deals the blow, nor the anvil which receives the blow, all of which appear to be—and, as I shall show you, actually are—made of the same material. You will say this is not correct; the one is iron and the latter two are steel. Nevertheless, both are composed of the same elements, and in both the proportion of these elements is almost identically the same. Steel is nothing but iron, only it contains a higher percentage of carbon. In the latter it is from about 0·05 to 0·6 per cent., in the former 0·6 to about 2·3 per cent. I call your attention to this figure 0·6, common to both because it shows at once how gradual the transition from one material to the other is. Which, then, are the important distinguishing features between the two? Iron, such as is alone suitable for our work, is soft. It can be hammered into all shapes, it can be flattened out, it can be swelled by the so-called process of "jumping," it can be bent at very sharp angles without breaking, and it assumes a pasty condition under the influence of great heat. This fact allows two separate pieces to unite in such a manner that they become practically one, and this process, which is so important for our work, is called welding. When heated, no matter to what degree, and suddenly cooled off in cold water, it does not changes its properties perceptibly.

Steel, on the other hand, is hard, breaks when bent at a sharp angle, becomes brittle when heated beyond a light-red colour, never assumes a pasty condition, and cannot therefore be welded. Its most remarkable property, however, shows itself when it is heated and then suddenly cooled off. In this case it becomes harder than glass, and just as brittle; when still more heated it loses all cohesion, so that small pieces detach under the slightest shock. As you can see, steel in this state would be quite useless for tools, but it can be treated in such a way as to preserve a sharp edge or point even when used with great force on material as hard as iron or ordinary steel. This treatment is called tempering, and it consists in heating the steel to a certain degree, which is judged by the colour it gradually assumes in the fire (from crimson to light red), and then suddenly cooling off in cold water. From this brittle condition it must be changed into a state of hardness or elasticity according to the different purposes it is to serve. This is done by slightly re-heating the material. It would be very difficult, if not impossible, to determine when the right degree of heating is reached if Nature had not provided a most wonderful phenomenon indicating this change. On a polished surface which has to be prepared for the purpose of more easily watching this phenomenon, during the process of re-heating appear in succession the following colours: Straw colour, dark yellow, light brown, dark brown, purple, dark blue, light blue, light grey. Straw-colour goes hand in hand with the hardness required for sharp tools which serve for working metal—for instance, punches, chisels, drills—this stage is still rather brittle; the brown colour accompanies the hardness sufficient for sharp wood-working tools or blunt tools destined for treating metal, such as the anvil and the hammer; blue comes into consideration only for articles which must be very pliable—all springs are tempered to that degree. The remaining two colours and the whole range of colours which during further heating fly over the surface in rapid succession are of little interest, as the material is approaching its original state.

Having spoken of the material of which the tools are made, I will not detain you with the detailed descriptions of those most used by the smith, but I will merely state that a conscientious smith will avoid as much as possible the aid of mechanical appliances, and confine himself to the use of the patriarchal anvil, hammer and tongs; the swage block, of which I have shown you a specimen, seems, however, to be a permissible addition to the smith's stock-in-trade.

I can now deal with the various operations to be performed by the smith. The first is

Forging.

It is best done when the material is heated to a light red. Smaller pieces are forged by one man; larger ones require one or more helpers, who then strike in rhythmic succession. Through knocking the piece against the anvil or through a few light strokes of the hammer, the glowing iron is freed from scale which otherwise would be hammered into the piece. If the latter is to become hard and elastic then the forging is to be continued until the piece becomes cold, or hammer and anvil are wetted, whereby a smooth surface is obtained. Pieces that have become too hard must be annealed—that is, heated to a dark red and gradually cooled down. The

Welding,

that is, joining of two separate pieces into one, is done when both are in a white heat. It is important that the smith should know exactly how to prepare his fire in order to heat his pieces, first in the right places and second to the right degree of heat, because the result depends on these two primary conditions; so that when the moment of welding has arrived he presents to the anvil two pieces of iron which are of the right heat and yet perfectly sound, which means not burnt. At first sight these conditions appear simple enough, and yet more than one smith whom one might ask whether he can guarantee his welding at the first attempt would at the critical moment where he introduced his pieces into the fire reply in the negative. The man is like seized with a fear of all the possible accidents; but this fear, instead of diminishing his faculties, gives him, on the contrary, an energy, a dexterity, a precision in the stroke of his hammer which he would certainly not have with *sang-froid*. For he knows that the welding can generally not be done twice over without seriously compromising the result, maybe, of days of difficult and always conscientious work. All these emotions through which he has to pass cause him to become passionate for his craft and to talk of it with pride. The points which the experienced worker will observe in order to prevent failure are the right size and intensity of the fire, which are best regulated by having a sufficient quantity of so-called "breeze" (breeze is coke from which less gas has been extracted than from ordinary coke, and it is washed three times in order to remove all dust and earthy substance which would cling to the iron and thus spoil the work) handy wherewith to replenish the fire, making it more intense than ordinary coal and allowing the iron to be evenly heated right through without burning it; then he will take care to prevent the blast or draught coming into direct contact with the pieces to be welded, as this would paralyse the action of the fire; he will turn round his iron often enough to protect it from being burnt, and each time he turns it he will sprinkle it with a little sand, which protects the outside of the piece from burning and helps the piece getting evenly heated.

The stretching is synonymous with the lengthening or widening of the piece of iron to be treated. The strokes with the thin end of the hammer are more efficient than those with the broad end.

The jumping is the opposite process, and produces a shortening and thickening of the piece. It is done by lifting and then heavily dropping the piece on to the anvil or to a special jumping block, or by striking one end of the piece with a hammer, whereby that portion of the iron which has been made red hot is swelled.

The adjusting gives to bent pieces or to those which have got out of their angle the right shape. It is done with the hammer on the anvil or on the "adjusting-plate," and can be done hot or cold.

The bending can also be done while the iron is hot or cold. If the piece has to be bent in an angle of 90 degs., it is hammered over the sharp-edged beak of the anvil; if it is to be round, the circular end of the beak is made use of.

The embossing or "repoussé" work gives to thin metal all sorts of plastic forms destined to enrich the heavier forged parts. It is done either hot or cold, the latter being preferable for the working of delicate details. Light hammers of a great variety of shapes, either with ball-shaped or edge-like, or flat faces, are employed for this work. Great experience is required to judge of the allowance to be made for reducing flat surfaces into curved and hollow shapes.

A Smith at Work.

Now we will imagine the smith setting to work, and we give him to make the piece which I put before you in the shape of this formidable-looking animal. Let the smith start by making the head. He will forge from a red-hot iron bar, say, 3in. wide by 4in. thick, by splitting it in front and opening it in the manner shown, whilst the neck is reduced in width and increased in thickness and rounded off so as to conform to the shape of the body. The mouth is further worked until the complete head has been formed. The lines are cut in with cold chisels of various shapes, round and straight. Then he will proceed to make the feet. He takes a bar of square iron, which he splits into four equal parts. These are spread out. An addition is then made in the form of a swelling above the claws, which are treated in a similar manner by welding a collar round each. The leg and the scroll are then made, and finally we have a ferocious animal completed.

In concluding his paper, Mr. Höfler described the making of an 8-light corona.

A Memorial Window has been placed in All Souls' Church, Harlesden, to the memory of Hubert E. Carlyon, vicar of the church, 1893–1900.

Masters and Men.

The Labour Market in November.—The Labour Department of the Board of Trade states that during November there has been some decline in the engineering and building trades. Employment in the building trades has continued to decline. The percentage of unemployed union members among carpenters and plumbers at the end of November was 3·5, compared with 3·1 per cent. in October and 3·3 per cent. in November of last year. In the furnishing trades employment has continued to fall off. The percentage of unemployed union members at the end of November was 4·2 compared with 3·6 per cent. in October. The percentage for November, 1900, was also 4·2. During the five weeks ended November 30th the number of dock and riverside labourers in London employed daily at all the docks and principal wharves averaged 15,909, as compared with 16,845 in the preceding four weeks, and 18,411 in the corresponding period a year ago. Twenty-five fresh disputes began in November 1901, involving 6,809 workpeople, of whom 4,924 were directly and 1,885 indirectly affected. The corresponding number of disputes in October was twenty-six, involving 10,501 workpeople; and in November 1900, forty-eight, involving 18,099 workpeople. Of the twenty-five disputes in November 1901, eight occurred in the mining and quarrying industries, nine in the metal, engineering and shipbuilding trades, three in the textile trades, and five in other industries. Of the twenty-five new and old disputes, involving 6,500 workpeople, of which the definite result is reported, seven, involving 1,556 persons, were decided in favour of the workpeople; eleven, involving 3,182 persons, in favour of the employers; and seven, involving 1,762 persons, were compromised. The changes in wages reported during November affected 257,961 workpeople, and the nett effect of all the changes was a decrease averaging 7¼d. weekly per head. Of the total number 10,500 received advances and 247,461 sustained decreases. The changes of the previous month affected 17,684 workpeople, the nett result being a slight rise, and during November 1900, the number affected was 148,774, and the net weekly result was an advance of 4½d. per head.

Builders' Notes.

Wolverhampton Town Hall is to undergo alterations and additions, and the tender of Messrs. H. Willcock & Co, of Wolverhampton, amounting to £14,550, has been accepted, and they have been asked to tender for the panelling of the council-chamber and the mayor's reception-room, and the erection of a gallery in the council-chamber.

Co-operative Building.—The December report of the Amalgamated Society of Carpenters and Joiners (which brings into prominence the fact that there is a general slump in the building trade) contains the noteworthy announcement that the great majority of the 68,000 members have voted in favour of the establishment of co-operative building and joinery works.

A Scaffold Accident.—Four men were on a scaffold engaged in work on the main entrance to the Cork Exhibition last Thursday, when the planks on which they stood gave way, and they were precipitated to the ground from a height of 30ft. One man was killed on the spot, and another sustained a fracture of the base of the skull, and is not expected to recover. Another of the men had his leg fractured, and the fourth received a bad shock.

Builders' Advertisements.—A writer in the daily press says: "It would appear that private-house leases commonly contain a minority clause directed against the carrying on of a business or exhibiting outside placards, &c. Nevertheless it is becoming the practice for builders, decorators, and others, during the period of their engagement to put up name boards and advertisements, chancing, I suppose, the legality of such being brought into question. When next time I am settling a bill for work done, in these circumstances I propose to deduct a handsome discount for any advertising space made use of."

Mr. Thomas Wilson, builder, aged sixty-seven years, who lived in Strathedene Road, Balne Lane, Wakefield, committed suicide recently. Deceased was a partner in the firm of Messrs. G. & T. Wilson, contractors.

Partnership Dissolved.—The partnership subsisting between Messrs. George Woollaston, of 22, Rockmead Road, South Hackney, and Robert Woollaston, of 22, Lacey Street, Bow (formerly carrying on business as builders, at 22, Lacey Street, Bow, E., under the style or firm of Woollaston Brothers), has been dissolved as from the 1st day of May, 1901.

Fire Prevention Tests.—The executive of the British Fire Prevention Committee have arranged to test next month a large timber floor by Millars Karri and Jarrah Wood Company, which is to show the fire-resistance of these Australian hardwoods compared with iron and concrete—a subject of the utmost interest to the great dock companies. The attendance of several distinguished foreign experts is anticipated. There will also be some door tests in karri and jarrah wood. We understand that among other tests to be expected early next year are tests by the Electric Timber Seasoning Company with treated wood; and by the British Uralite Company with fire-resisting slabs.

The Registered Plumbers in the District Council Area of Cardiff, South Wales and Monmouthshire, in connection with the Worshipful Company of Plumbers, London, held their annual dinner at Barry's Hotel, Cardiff, on December 14th, the president of the District Council, Mr. W. H. Dashwood Caple, architect, in the chair. Mr. E. W. M. Corbett, J.P., president of the Cardiff, South Wales and Monmouthshire Architects' Society, Alderman Ramsdale, J.P., Mr. Edwin Seward, F.R.I.B.A., Dr. Prichard, medical officer of health, Dr. P. J. O'Donnell, C.C., Dr. Alfred Rees, and Mr. E. W. Waite, hon. secretary, were present. In the course of the evening the president distributed certificates to four master and twenty-seven operative plumbers who had passed the qualifying examinations.

LONDON COUNTY COUNCIL.

At last week's meeting of the Council the Historic Records and Buildings Committee recommended that the many houses in London which had been associated with historical events or distinguished individuals should have some indication of such associations. The Society of Arts had been engaged in this work, but were not able to do so much as the Council could. Mr. Beachcroft moved an amendment referring the matter back for further consideration. He thought unless they had a committee of of taste it would be very difficult to carry out the Committee's proposal. It would be hard to say whether the author of "Cheer, boys, cheer" or the author of underground shallow tramways should be included in the list of distinguished persons. The amendment was defeated by 54 votes to 46, and the recommendation agreed to.—Replying to Mr. Beachcroft, Lord Welby stated that in connection with the strike at Horton Asylum, Epsom, a letter had been received from the council of the Operative Bricklayers' Society to the effect that the council, having considered the matter, had decided that if the County Council was prepared to open the work at once the workmen would resume. In answer the Committee had telegraphed that they would accept these conditions, and the strike was therefore at an end.—It was agreed to vote £1,330 to cover the cost of the interest on the purchase-money for the Marble Hill Estate. Lord Monkswell announced that as the Middlesex County Council seemed to object to clause 15 in the Council's General Powers Bill, relating to the provision of landing stages and boats at the estate, that clause would be dropped, at any rate for this year.—The adjourned report of the Housing Committee was presented, dealing with the Mill Lane scheme, Deptford. It is proposed to erect a Rowton House on the site to provide accommodation for 804 men. The cost of the building will be £49,287 15s., and it was recommended that the architect's estimate of this amount be referred to the manager of the Works Department to carry out the erection. After discussion this was agreed to.—The Works Committee presented a lengthy report relating to the status and duties of the several assistants in the engineers' and surveyors' departments, containing recommendations for increasing the salaries of several of the present assistants, and suggesting the following new appointments in the engineers' department: Assistant engineer (£250 per annum), third-class draughtsman (£75, rising by £5 to £100), and shorthand clerk and typist (£70, rising by £5 to £100). The recommendations were agreed to.—A statement was submitted by the Finance Committee showing the estimated and actual cost of works completed by the Works Department during the half-year ended September 30th last. The statement dealt with twenty-one works, the final estimate of which was £103,620 16s. 2d. The actual cost was £118,162 5s, showing a balance of £14,541 8s. 10d.

Keystones.

A New Free Library at Gorton has been opened.

A Spire on St. Philip and St. James's Church, Cheltenham, is proposed to be erected.

The Church of Manor Cunningham, Co. Donegal, is proposed to be restored at a cost of £1,000.

A Bust of Chaucer is being executed by Mr. Frampton for the Guildhall. It is to be carried out in marble and silvered bronze. Busts of Lady Granby and Mr. Alfred East, A.R.A., are also being executed by Mr. Frampton.

The Chancel of Aylesbury Parish Church Bucks, is to be panelled in oak, with pinnacled figures on the east wall, all round the sanctuary. This work, together with the provision of two brass candelabra, will costs upwards of £400.

New Works for Northwich.—Messrs. Gossage & Sons, soap manufacturers, of Widnes, together with a number of other influential manufacturers, have acquired a site of 141 acres at Rudheath, Northwich, and are about to erect a large works for the manufacture of chemicals and by-products.

The Private County Asylum at Thorpe is to be enlarged, at a cost of about £70,000., from plans by Mr. A. Wood, architect. It is proposed to enlarge the auxiliary building and connect it with a complete asylum for male patients, retaining the original building for females. The additions to the auxiliary building comprise new block for sick and infirm epileptics, and enlargement of the present eastern wing for acute cases. In addition to the wards it is proposed to erect new workshops, mess and recreation rooms for attendants, a new bakery, a photographic studio, and to make sundry alterations in the administrative offices. The suggested alterations at the main building comprise the re-arrangement of the stables, workshops, and boiler-house.

At Wendron Church, near Holston, carved chancel fittings, in West-country grown oak, have been recently presented as a memorial to the late Rev. William Lethbridge. These additions consist of stalls, affording accommodation for twelve choirmen and fourteen singing boys, with detached desks and seats for two officiating priests; a lectern, as well as altar rails. These latter are entirely made of carved oak. The stalls, like all the rest of the new work, are in the fifteenth-century, or Perpendicular, style of Gothic, and are of massive construction; the fronts being pierced by tracery and enriched by carving. The work was executed by Messrs. Harry Hems & Sons, of Exeter.

Croyland Abbey.—Funds are appealed for to enable the repairs necessary to secure the preservation of what remains of the grand old Abbey of Croyland or Crowland to be completed. The work has been going on since 1887, and nine out of the ten sections into which it was originally divided have been accomplished. The object all through has been preservation, not what is commonly known as restoration: to make safe and secure the Abbey fabric, and to protect the ruined parts from further ruin and decay. The north aisle is used as the parish church, and its roof has for a long time been in a bad state. The late Mr. J. L. Pearson, R.A, said it ought to be entirely taken off and renewed and the lead covering recast and relaid. In its present condition it presses against the outer walls, and so has developed cracks in the groining below, besides doing other mischief. To put this right would cost nearly £600.

Alston Town Hall has been opened after extensive renovation of the interior.

The Renaissance Saloon at the Café Monico has been redecorated by Messrs. V. & G. Jetley, of 8, North Audley Street, Grosvenor Square.

Colchester New Town Hall was opened last Monday. The building has been designed by Mr. John Belcher, A.R.A., of 20, Hanover Square, W., and erected by Messrs. Kerridge & Shaw, builders, of Cambridge.

Builders' Journals Wanted.—The publisher will be glad to send a copy of the current number of "The Architectural Review" in exchange for a copy of "The Builders' Journal" for December 27th, 1899.

A New Public Museum at Sheffield has been opened at High Hazels Park, Darnall, one of the suburbs of the city. The park has belonged to the Corporation for a number of years, but it is only of late that the Council resolved to transform the house into a museum. This has been effected at a comparatively little cost, as no structural alterations were involved.

Camberwell Public Baths Competition.—The first premium has been gained by No. 18, Mr. E. Harding Payne, the second premium by No. 7, Messrs. S. B. Russell and C. E. Mallows, and the third premium by No. 32, Mr. H. Dighton Pearson. Mr. E. Harding Payne has been appointed architect, and the building is estimated to cost £50,000. Mr. A. Saxon Snell, the assessor, also highly commended five others, to each of whom the committee recommended £10 should be given, but this was not approved; out of these five the design No. 35 by Mr. Arthur R. Groome, A.R.I.B.A., of St. Peter's Square, Manchester, was especially noticeable.

A New Coastguard Station at Bexhill is being erected for the Admiralty. The scheme provides for two rows of houses, running north and south. One block will contain five houses and the other seven houses, all being two-storey buildings, with the exception of the chief officer's residence, which will have an additional attic-floor, and to this dwelling the watch-room will be attached. The houses in both rows will each contain five or six rooms, the chief officer's residence having two additional rooms. There is to be a boat-house built in connection with the scheme to provide accommodation for two boats, with dimensions of 32ft. by 18ft. Messrs. Nash & Nash, of Thornton Heath, are the contractors.

New Cathedral in Uganda.—Mr. Borup, of the Church Missionary Society, has sent home some interesting details of a church of brick which is being built under his direction by the Baganda. Fifty-six bricklayers are employed, most of whom have been trained since last year. They are, Mr. Borup reports, working willingly, and he does not think there will again be any difficulty in getting briaklayers in the country. The length of the church is 206ft., the width is 50ft. The roof will be thatched with grass. In addition to the bricklayers several hundred other workmen are engaged, and are receiving weekly wages.

New Public Offices at St. Annes have been erected on South Drive from designs by Mr. Muirhead, of St. Annes and Manchester, and will have cost about £4,000. The building stands within about half an acre of ground. The building is entered through a Norman arch, leading into a commodious vestibule, sliding doors leading into a spacious hall, which has a noticeable mosaic floor, the work of Messrs. Turner, Heason & Mitchell. The council-chamber is a large room 28ft. by 22ft. Adjoining are the offices of the clerk and sub-clerk; here is a chairman's room and a committee-room. On the ground-floor are the surveyor's private and public offices: the rate collectors, overseers', and medical officer's offices, and electrical engineer's offices. The building is heated throughout on the latest hot-water pipe system by Mr. W. Bailey, of Manchester. The general contractor was Mr. W. Woodcock, of St. Annes, and the sub-contractors were Mr. J. S. Comfort, brickwork; Mr. J. C. Rushfirth, stonework; Mr. W. Read, plumbing; Mr. W. Woodcock, plastering; Messrs. Matthews & Radcliffe, painting and decorating; Mr. T. Pearson, slating; and Mr. W. Woodcock, joinering, the latter has supplied all the fixtures; Messrs. Garnett & Co., furnishing; Messrs. Gill & Read, fire ranges; Mrs. C. W. Slee, fire-irons, &c.

Two Painted Glass Windows have been erected in the south wall of the royal pew at Whippingham Church, Isle of Wight, in memory of the late Duke of Saxe-Coburg and Gotha.

Berlin's Avenue of Victory.—The last figure in the row of statuary in the Sieges Allee, Berlin, was unveiled last week by the German Empress. The statue represents the Kurfürst Johann Georg.

New School Buildings at Keswick have been opened. They consist of a gymnasium, science laboratory, cookery school, and carpenter's shop. The block is situated a few yards from those opened in 1898. The architects are Messrs. Austin & Paley.

Mr. Sargent, R.A., has been created a corresponding member of the French Academy of Fine Arts. In Paris he had his chief training, in the studio of M. Carolus Duran. Beginning young, Mr. Sargent exhibited his first work in the Salon of 1879.

A School Competition.—We have before us the particulars of the proposed additions to the High School buildings at Kirkcaldy. A block plan is required showing drainage, but no plan of the site is given! And the Board will pay a fee of 4 per cent. to the successful architect! This is what brings competitions into disrepute.

A New Baptist Church at Cambridge is to be erected in St. Andrew's Street, the design of Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines having been accepted. The building is to be faced with whole white flints; the dressings, tracery, &c., being of red Mansfield stone. A bold square tower forms a prominent feature of the design. The joinery is to be of oak. The seating accommodation will be for about 950 persons. The estimated cost is £6,200.

A New Market at Bury has been erected by the Corporation, at a cost of £14,500, at the junction of Market Street and Moss Lane. The new market covers a superficial area of about 30,000ft., and is so planned as to be capable of easy extension by the addition of bays to the south. There are provided one hundred stalls, nineteen shops and five fish shops. The shops are placed round three sides of the building. The central hall extends across the angle formed by the junction of Market Street and Moss Lane, and is approached by a wide central entrance and by two side entrances.

A Discovery at Falkirk has been made of interesting relics of the Roman occupation of the Stirling district, in the shape of a large stone, about 19in. broad, 10in. thick, over 4ft. high, and weighing probably half a ton, beautifully sculptured in high relief; the ornamentation divided into two panels, the larger one being at the top. These panels are separated by a band about 1½in. broad, which also is carried round both panels, meeting in an angle at the top of the stone. Under the angle is a shell-like device, delicately executed. The upper panel is completely filled by a horse and rider, the latter carrying a sword triumphantly aloft. He is arrayed in full armour, and bears a shield. The lower panel represents a naked man, a wild Celt presumably, in a fallen condition, his shield and weapon lying beside him. The profile is perfect, and the stone is in a complete state of preservation.

Architect to the Birmingham School Board.—At the forthcoming meeting of the Birmingham School Board the Sites and Buildings Committee will recommend that three months' notice be given to Messrs. Martin & Martin, architects and surveyors, to terminate their engagement, all work which they have now in hand for the Board to be completed by them on the existing terms; that the Board advertise for an architect to be the architect to the Board for new works at a rate of remuneration of 7s. 6d. per scholar of accommodation, plus 1½ per cent. for taking out and furnishing quantities the engagement to be for three years, with a clause for determining the same at three months' notice on either side at any time; that the Board advertise for a land surveyor at a commission of ¾ per cent. on the purchase money; and that the Board advertise for a superintendent of buildings for alterations and repairs, at a salary of £250 per annum, to devote all his time to the duties and to work in the Board's offices, all necessary office furniture, stationery, &c., being provided by the Board.

COMING EVENTS.

Saturday, December 28.

ROYAL INSTITUTION.—Prof. J. A. Fleming on "Waves and Ripples in Water, Air and Æther"—I. 3 p.m.

Tuesday, December 31.

ROYAL INSTITUTION.—Prof. J. A. Fleming on "Waves and Ripples in Water, Air and Æther"—II. 3 p.m.

Wednesday, January 1.

SOCIETY OF ARTS.—Sir Henry Trueman Wood on "Photography and its Applications"—I., 5 p.m.

Thursday, January 2.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.—Mr. A. S. E. Ackermann, A.M.I.C.E., on "Engineering Observations in 1901 in the United States of America," 8 p.m.

ROYAL INSTITUTION.—Prof. J. A. Fleming on "Waves and Ripples in Water, Air and Æther"—III., 3 p.m.

Friday, January 3.

ARCHITECTURAL ASSOCIATION.—Mr. J. A. Gotch on "The Development of Domestic Architecture from the Twelfth to the Eighteenth Century." 7.30 p.m.

INSTITUTION OF JUNIOR ENGINEERS.—Mr. John Buley on "The Uses of Exhaust Steam," 8 p.m.

An Architectural Causerie.

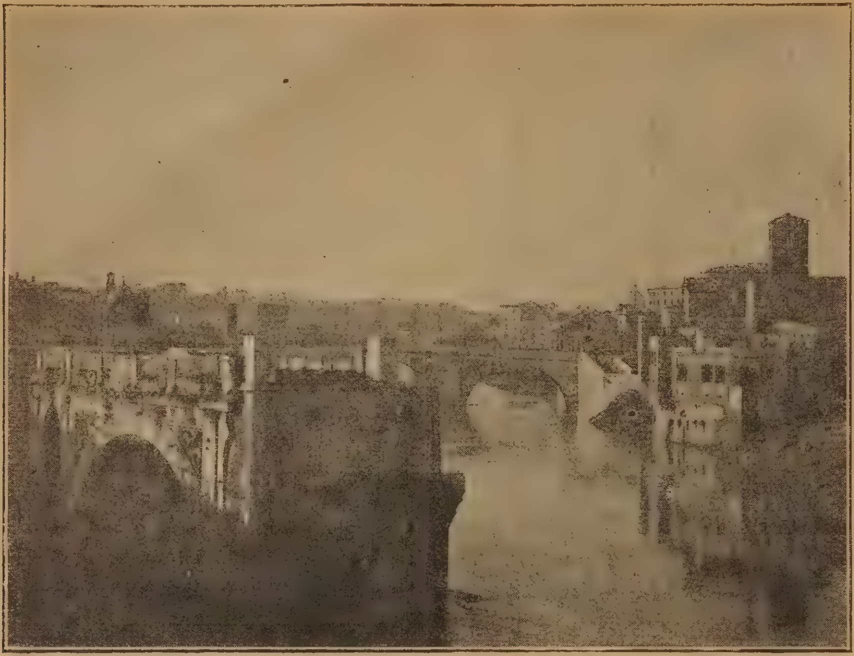
The Past Year. A LARGE picture cannot be judged by standing close to it. If (like Frith's) the technique is so marvellously minute that a close inspection is demanded, the picture must almost inevitably fail in grandeur when viewed comprehensively, because whatever charm there may be in the detail will be lost, and instead of a bold effect there will be nothing but pettiness; whereas, if the artist treats his subject in a noble manner the seeming coarseness which might appear on a close examination is seen to change to massive outline and generous breadth when the work is viewed in its entirety at a distance. And of architecture the same may be said—that it is quite impossible for men to take measure by a contemporary standard, because they are under the same influences as those whose work they are estimating, and though it may seem perfectly right to them in their own time, posterity may pronounce it wholly wrong; and posterity, being unhampered by details and surveying the whole ground instead of a portion of it, is likely to be right. For example, we are able to measure the Gothic Revivalists more correctly than their contemporaries could; we see the folly of their expectations, but they did not; just as, in another way, Evelyn in the eighteenth century spoke of Gothic architecture as crude, unconstructional and barbarous, whereas we know that it displays the most wonderful construction in all architecture and has produced the most lovely forms that could possibly be created by human hands. Looking back therefore on the work of the past year it is quite impossible to define limits of advance or retreat; the only indications which may be observed are general indications—the prevalence of this particular treatment or the absence of that—and in this broad way it seems that architects are improving and that their works, being designed more according to constructive and utilitarian requirements, do not suffer so much from the mistakes that were so common twenty years ago; and it is in the continuance of these methods that we may hope for future improvement. Architects are being trained better; they know more about the why and wherefore of things; and consequently they use materials more truthfully and logically.—Undoubtedly the most important architectural event of the year has been the limited competition for the National Memorial to Queen Victoria, which first became generally discussed in March last, when the Buckingham Palace site was selected. At the present moment, with the fund standing at less than £190,000, the completion of Mr. Aston Webb's design is not hopeful, considering that the greater portion of such sum would be needed for the memorial itself. Other competitions in various parts of the country have furnished other results—some good, some bad. At the beginning of the year the Glasgow Royal Infirmary competition showed how committees can abuse their priviliges—in this case it will be remembered they put aside the award of their assessor (Dr. Rowand Anderson) and followed their own judgment, which happened to be attached to a plan that was an elaboration of one of the two sketch plans prepared by two members of the Committee who (to quote the Glasgow Institute of Architects) "have not enjoyed the training which would qualify them as surgical, medical or architectural experts." Then there have been competitions for infirmaries at Bristol and at Hull, a workhouse and a town hall at Stockport, a fire-station at Manchester, new municipal buildings at South Shields and at Hereford, a dental hospital at Birmingham, a polytechnic at Hackney, and, most recently, public baths at Camberwell. During the year considerable interest has centred around the new Government offices now being erected in Whitehall, the proposed cathedral for Liverpool, the alteration to London Bridge and the subsidences at St. Paul's Cathedral, the Kew Cowl tests, the various housing and other schemes of the London County Council, the widening of Piccadilly, the Richmond Hill view, Christ's Hospital, the condition of the building industry and the effect of trade-unionism on bricklaying, and numerous other matters of a kindred nature, the pros and cons of all of which have already been discussed in these columns. At the Royal Academy the architectural room furnished no design of great moment, though the domestic work was, on the whole, extremely pleasing. The Building Trades' Exhibition proved to be the best as it was the largest yet held, though the conference with regard to the standardization of bricks was inconclusive and not likely to result in any change. In the following month (May) the great exhibition opened at Glasgow, an exhibition which was a financial and architectural success. Among the numerous papers read before the various architectural and engineering societies during the past year there were many of considerable value and interest; but it is to be regretted that, in view of the fact that they are written by such acknowledged authorities, they are not read as widely nor as closely as they deserve. Perhaps the most important of those given before the Royal Institute of British Architects were Mr. G. T. Hine's on "Asylums and Asylum Planning," Professor Flinders Petrie's on "The Sources and Growth of Architecture in Egypt," Professor Lethaby's on "Education in Building," and Mr. Francis Bond's on "The Classification of Romanesque Architecture." Of the Architectural Association papers may be noted, Mr. Max Clarke's on "The Sanitation of a Country House," Mr. H. B. Measure's on "Rowton Houses," and Mr. Alfred Hands's on "The Protection of Buildings from Lightning.

THE FORUM FLOODED, 1900; FACING NORTH-EAST.

In reviewing the events of the past year reference should be made to the changes effected in connection with THE ARCHITECTURAL REVIEW. The fact that this—the only monthly magazine of its kind in the country—is produced under the direction of an advisory editorial committee comprising some of our best-known and ablest architects, augurs well for its future.

Several well-known names have needed to be struck off during the year—J. M. Brydon, Arthur Cates and Ebenezer Gregg (all of whom died in May last), Yeoville Thomason (July), James Brooks (October), C. J. Innocent (November) and Onslow Ford (December). The following are the most notable new books published during the year (irrespective of new editions):—"Early Renaissance Architecture in England" (Gotch), "A Short History of the English Renaissance" (Blomfield), "The Later Renaissance in England" (Belcher and Macartney), "Some Architectural Works of Inigo Jones" (Triggs and Tanner), "The Decorative Work of Robert and James Adam" (Batsford), "Dictionary of Architecture and Building, Vols. 1 and 2" (Sturgis), "London Housing, 1855 1900" (L.C.C.), "Building Specifications" (Leaning), "A Price-book for Architects and Engineers" (Coleman), "Die Englische Baukunst der Gegenwart" (Muthésius), "The Georgian Period" ("American Architect"), "The Origins of Art" (Hirn), "The Double Choir of Glasgow Cathedral" (Watson), and "Modelling" (Lanteri). With regard to the building industry itself, this has been most depressed throughout the country, due to the effect of the war and the consequent scarcity of money, and the continued high prices of materials; and there seems little indication of improvement.

It is usual to speak of the future with hope, and so far as architecture in this country is concerned, it may well be said that so long as those who practise it endeavour, as many are endeavouring, to design with knowledge and to suit everything to requirements, so long will there be a tendency to improve, which tendency is entirely dependent for its strength on the collective ability of architects and the betterment of taste among the official and lay public. There is yet much to be done, and the difficulties in the way are many and great; but they are not insuperable.



PONTE ROTTO WITH THE TIBER LOW.

NOTES ON ROME.

By MAUD BRETTINGHAM (Rome).

ROME of to-day is being subjected to a double and strangely incongruous process—that of demolition and reconstruction. While archæologists are feeling their way to the old level and carefully sifting every spadeful of earth, only a few yards away architects are erecting new buildings and piling bricks and mortar over historic ground and hidden treasure. Take, for instance, the Forum, where Professor Boni has been doing such splendid excavation work of late, and of which many particulars have been published in these columns from time to time. On the other side of the Capitol the State is erecting a monument to Victor Emmanuel, of such colossal proportions that it will require a decade before there is money enough to complete it. Rome, since (unfortunately for historical research) it was chosen as the capital of Italy, has more than doubled its population, and has contracted a loan of 150 million liras for public works. The state has undertaken to erect the "Policlinico," the "Palace of Justice," the embankment of the Tiber, several bridges, Via Cavour, and the monument to Victor Emmanuel. With regard to the embankment of the Tiber, the accompanying photographic illustrations show very forcibly how much the work needs to be completed. During the last inundations, just a year ago, the rise in the Tiber is illustrated by the photograph of Ponte Rotto as compared to that taken in normal times. The standing pier is the last remnant of an old Roman bridge in Rome. It was the Pons Æmilius of 573. This, the oldest bridge, was wantonly destroyed in 1886 by the embankment work then going on.

When the rains had ceased, a picturesque scene was afforded by the fourth-century church of St. George in Velabro, standing deep in water, but casting so perfect a reflection in the brilliant sunshine as to make it almost a puzzle to determine where the real ceased and the reflected began.

It is interesting to note, with regard to the Forum in its present state of excavation, that the old prints up to the beginning of this century show us little more than the capitals of the remaining pillars of the highest temples as alone visible above ground. In the seventeenth century many learned works appeared on the Forum, and "closet scholars" exercised their brains on its topography, while it remained buried beneath their feet. Thus, up to the present date all works written in the dark have become more or less obsolete in the light of the discoveries of to-day. It was reserved to the nineteenth century to bring the Forum once more to the light of day. The work of excavation was begun in its second decade by the French, who, then in occupation, were eager to obtain statues and other treasures as plunder. On their departure the Duchess of Devonshire obtained leave to carry on the work; and now within the last twenty-five years the Italian Government have slowly and surely continued it. To-day, as cartload after cartload of earth is painfully drawn by horses and mules beyond the Arch of Titus over a heavy road, there can be no more interesting sight in the world than the hourly laying bare of the great Foro Romano.

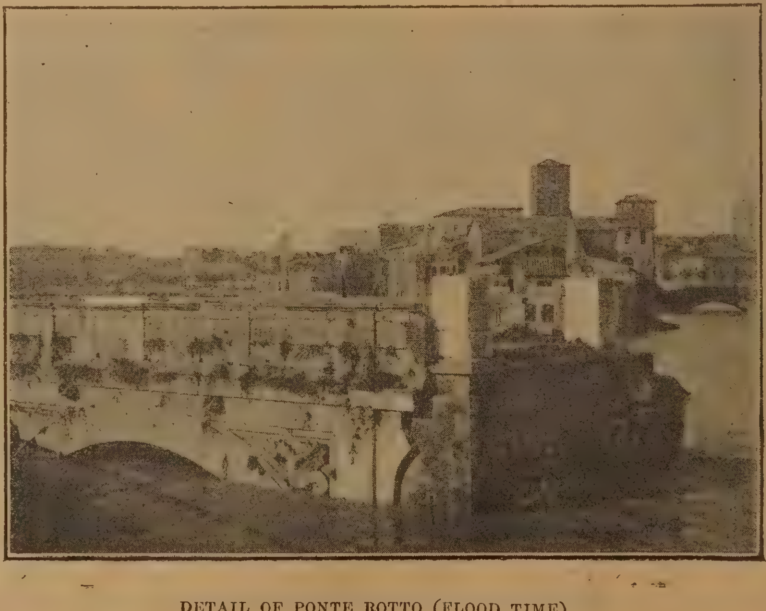
It is marvellous how small the Forum was: 260yds. long, and 140yds. wide at its widest, beneath the Capitol.

Considering its limited space, the marvel is that so many temples, basilicas, columns, triumphal arches and rostras could possibly have found place in it; but from the latest plans we see that the principal temples were raised on lofty platforms, thus gaining in height what they lacked in expansion; that the other temples were small shrines; and that the only available free space was in reality the Comitium, in which, just at the foot of the Arch of Septimus Severus, the discovery of slabs of lapis niger gave rise to the belief that the tomb of Romulus had been found. This notion has now been discarded; and though tradition and Varro give this spot as his burial-place, we cannot reasonably expect to find any remains of the son of Mars.

Another point of special interest is the excavation at the base of the temple of Saturn, beneath which the treasury was deposited, as recorded by Plutarch. Just outside the Forum proper, on the right of the Via Sacra towards the Arch of Titus, is the base of the temple of Vesta, a discovery of late years, and, closer under the Palatine, the House of the Vestals, the most secret and sacred spot in Rome. Reminiscences can be traced very perfectly. Here in the Atrium are the foundations of the shrine which contained the Palladium, "by no male beheld" (Lucan)—a statuette of Minerva from Troy. In this most interesting ruin many statues of vestals are propped against the walls, and it is damp and dank as in the time of the Emperors, when on account of its sunless, covered-in position, close under the Palatine, it had to be heated with hot air and water, the appliances for which have been traced.

The most picturesque discovery of the past year, or rather the one which appeals most strongly to the imagination, is that of the subterranean galleries running north and south and east and west under the heart of the Forum, in the space between the Black Stone and the Basilica Giulia, immediately in front of the Rostra. These galleries are 10ft. high and 4ft. broad. They lie about 1ft. below the surface of the Forum, and communicate with the air by openings large enough to admit of the passage of a man. At distances along the galleries there are square chambers large enough to admit apparatus for working a kind of windlass, and the sides of the openings are worn down by rope marks—a sign that heavy objects must have been raised and lowered through them. The most probable explanation is that the galleries were used as an *armamentarium* during the Cæsarian games which took place in the Forum prior to the construction of the amphitheatre. The most probable date of their construction is about 45 B.C., during the lifetime of Julius Cæsar. For the present the examination of the galleries has had to be suspended owing to the infiltration of water, but as soon as the municipality has arranged a proper outlet for the Cloaca Maxima, operations will be resumed.

The Parish Church of Haconby, Bourne, has recently been reopened after a thorough restoration, at a cost of nearly £2,300. The Earl of Ancaster has paid for the restoration of the chancel and side chapel, the tower, and the provision of seats for the chapel, which altogether cost his lordship upwards of £1,100. The whole of the work has been carried out to designs by Mr. C. A. Passett-Smith, the architect; and Mr Halliday, of Stamford, was the contractor.



DETAIL OF PONTE ROTTO (FLOOD TIME)

ULSTER SOCIETY OF ARCHITECTS.

THE annual general meeting in connection with this Society was held recently. Sir Thomas Drew (president) presided.

The president, in the course of a brief address, congratulated the Society on the progress it had made and the good work it had already accomplished. Mr. W. J. Gilliland, vice-president, afterwards submitted a report, which stated that since July 22nd last there had been five members, seven associates, and six students elected, and that there were several others on their way through the Institute, their names being on the ballot papers at present. The report concluded as follows: "The Belfast City Corporation, with a desire to improve the street architecture of the city, propose to include in an omnibus Bill which they intend to promote in the coming Session of Parliament a clause to regulate the 'elevations of buildings.' By a hastily-drawn and ill-considered clause they propose to cut the Gordian knot of a difficult problem by making the city surveyor the universal architectural censor for the city. Your Council have protested in the strongest way against this intolerable tyranny, and they will persist in their opposition, in which they expect the support of every member of the Society until this objectionable proposal is withdrawn. A very substantial section of the Corporation—that which understands the subject best—is with us, and we have no doubt that we shall bring others to see that, far from producing a desired and desirable improvement, the result of giving a city surveyor such powers would be most unsatisfactory, and indeed unworkable. In conclusion, I would again urge on every member the desirability of giving loyal support to the Society in every way possible, and remind them specially of the undertaking which each has signed by which he promises to attend all meetings of the Society whenever at all convenient."

The following were then elected:—As member, Mr. James A. Hanna; as associates, Messrs. J. Bevin, W. C. Maxwell and C. D. Patterson; as students, Messrs. D. Parkhill and J. Seeds. The following officers were elected for 1902:—President, Sir Thomas Drew; vice-president, Mr. W. J. Gilliland; hon. secretary, Mr. N. Fitzsimons; hon. assistant secretary, Mr. W. B. Fennell; hon. treasurer, Mr. Vincent Craig; council, Messrs. J. J. M'Donnell, M. A. Robinson, F. H. Tulloch, W. J. Fennell and Henry Seaver.

The annual dinner was afterwards held, Sir Thomas Drew (president) in the chair.

The president, in reply to a toast, said if he might be permitted to allude to current affairs, he noticed they had already found themselves face to face with questions of very great gravity to their profession as well as to the public of Belfast; and he had no doubt when in time they came to be better recognized their organization would be an exceedingly useful one, working in harmony with the municipality. That was the case in Dublin, where there was a kindly feeling existing between the architects and the Corporation. In all the legislation promoted by the Dublin Corporation in which architects were interested they had invariably been consulted. In Belfast there was a question which affected them. A Bill had been promoted in Parliament which would in some points affect the practice of architects in this city, and there had been put into his hands that night for the first time a draft which was proposed. Among other things it stated, "The surveyor may disapprove of such elevations on the ground that they are, in his opinion, objectionable, or that in any respect they are not in conformity with the requirements or provisions of the existing local Acts or by-laws of the Corporation." That was certainly a most extraordinary clause, and, he feared, was drafted under a total misapprehension and mistake. The draftsman of such a clause could not possibly have conceived what the ultimate result would be and how it would affect architects. In the first place, could he have thought what a blow it was to the liberty of the free subject in this free kingdom? Municipal laws as regarded buildings were no novelty. Parliament had been hammering away at them for fifty years, and, after many amendments and new Acts, municipal legislation as to buildings was in a pretty concrete state. The City of London had a system which, with all its faults, was as nearly perfect as it could be. The Local Government Board of England had issued model by-laws, which had been adopted by even the smallest urban authorities in the smallest towns. While the great municipalities of England had their legislation and their by-laws pretty well now in smooth working order, he ventured to say in no part of the King's dominions would such a clause as that proposed by the Belfast Corporation be found. It would be impossible. He remembered in former times such a thing was once attempted in Dublin illegally. The thing was at once put down with a high hand by public spirit. A tyranny of that kind exercised by a city officer on the free right of citizens to build on their own land in the proper way could not be tolerated for one moment, as it was a violation of the principles of freedom in this country and at variance with all municipal laws. That was a lesson, and the Corporation of Dublin had never attempted to take any such powers again. He doubted if they would be granted by the Legislature if proposed. Those things which were really objectionable and offensive in property were regulated by the ordinary legislation in towns, and the precedents he had quoted were quite sufficient to meet them. The general powers given to municipalities as to frontage lines and the widening of streets were quite sufficient and worked very smoothly. Then, again, if such a preposterous clause as that proposed were

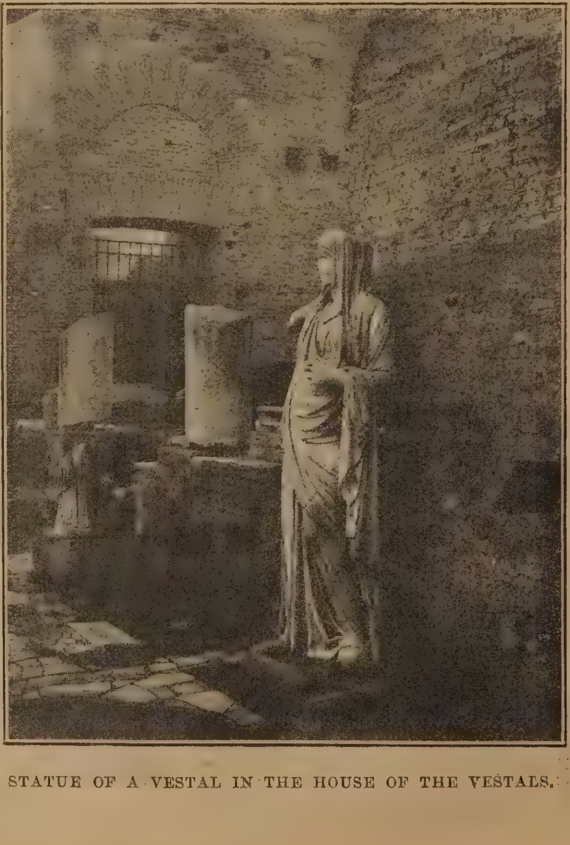
FRAGMENTS FROM THE EXCAVATIONS IN THE BASILICA ÆMILIA.

adopted, who was the surveyor that he should be censor of architecture any more than that of morals? What were his qualifications for the position? He was not an architect as a rule. He (Sir Thomas) should also be very sorry indeed to see a censor of architecture appointed, although he might be a distinguished architect. They had all ideas of their own as to how things should be done. They should remember how that kind of thing was met in London under the Metropolitan Building Acts. There was a court of arbitration, consisting of three professional men, and their decision was the rule for the County Council. On mere questions of taste and architecture there should be no censor. Such a thing was foreign to the whole spirit of the British trader, and at variance with the free spirit of the country. If such a thing were imposed it would be to the detriment of the architectural progress of the country. He hoped there would be sufficient good sense on the part of the Corporation of Belfast not to insist upon the proposed clause, and that a pen would be drawn through it before it became a public and burning question. It would be more creditable to the common sense of this city if that clause was drawn simply on the lines of other municipalities, and then there would be no more heard about it. If it, however, should be presented to Parliament he was sure the architects of the city would take steps to oppose it. It would be their duty to do so, and he could promise that in their opposition they would have the assistance of the Royal Institute of British Architects and of the allied societies throughout the kingdom. He sincerely trusted the by-laws of his native city would be model by-laws, and that the architects and Corporation would work in harmony together.

A New Bank at Dorchester has been erected in South Street, for Messrs. Stuckey's Banking Company. The entire premises have a frontage of 49ft., and a depth to the garden behind of 100ft. The bank is built in ashlar work of Ham Hill stone, while the residental premises behind are built of the best Wellington brick. The building was designed by Mr. G. H. Oatley, architect, of Bristol, and built from his plans by Messrs. Henry Pittard & Son, of Langport. The figure carving in the gables was done by Messrs. Davey & Bushell, of Bristol. The bank fittings have been put in by Mr. G. Gane, of Bristol; the tiling done by Messrs. Carter & Co., of Poole; the wood-block floor laid by Mr. Ebner, of London; and the electric bells fitted by Mr. W. J. Durden, of Dorchester.



STATUE OF A VESTAL IN THE HOUSE OF THE VESTALS.

NORMAN ARCHITECTURE.

MR. J. T. FOURACRE delivered a lecture recently at the Plymouth Institution on "Norman Architecture." Remarking that the style of the Norman period of building had not had sufficient attention paid to it, the lecturer held that it could hold its place in comparison with the best architectural achievements. He did not claim for the ornamental details the beauty of the succeeding periods; there was what would seem now almost a barbaric character in some of the early ornamentation, but, for solemn grandeur and beauty of proportion, Norman design had been surpassed by few styles. The buildings, or rather the remained fragments, a silent witness of their energy, skill and masterful handicraft in the sublime art of building. Historians consented that for general comparison with the other nations of Europe the Normans were eminent, if not superior, with respect to civilisation and the arts. Among the prelates in the early Norman reigns were found men of consummate skill in architecture. Their influence in England must have been enormous. No sooner were the Norman settled in this country than churches, cathedrals and castles were sown broadcast throughout the land. A large body of masons and other craftsmen must have been raised, more skilful than ever existed in the country. Some of the most skilful, no doubt, came from Normandy. When Lanfranc came to England and found his cathedral of Canterbury in ruins from the fire of 1067, he re-erected it from the model of his Church of St. Stephen at Caen. Where did he get his models from originally? Did they not come from Lombardy? What was termed Norman architecture did not spring up entirely on Norman soil; the Lombardic influence could be clearly traced. Mighty men like Lanfranc, Anselm, and others, brought with them a train of working monks from beyond the Alps. They influenced the Normans, who, in turn, by their progressive ideas and aptitude, perfected a school of architecture. Lanfranc must have had good experience in building prior to his coming to England. He probably worked at building with his own hands on the monastery at Beck when it was enlarged. There was not the slightest doubt he studied architecture. The style which grew up in Normandy during the early years of William was brought into England in the days of Edward the Confessor; it was merely strengthened on to perfection after William's coming. That the rebuilding of the West-Minster marked the beginning of Norman architecture was an acknowledged fact, and it long remained the great model of the style, the object of imitation for English architects even in the following century. The degree of ornament and finish in workmanship was not always a question of date; it was often a question of taste and means of the builder. William of Malmesbury said the Normans, by their arrival, revived the observances of religion, and they might see churches rise in every village and monasteries in the towns and cities built after a style unknown before, and the country flourishing with renovated rites, so that each wealthy man accounted that day lost to him which he had neglected to signalise by some magnificent action. It was known that these remarks correctly described the great building wave that swept over the country; they could hardly go into a town or village but some remnant of the Norman builder, some old arch or pier or sculptured stone, showed how busily the builders must have worked. The solemn stateliness of Norman buildings was heightened by the use of artificial light. He purposely visited Tewkesbury Abbey during an evening service to see the effect at night, and was quite charmed by its grandeur. Pointing out the strong affinity of Norman ornaments to heraldic partition lines, the lecturer went on to speak of the doorways as one of the glories of the Norman styles, suggesting that their beauty might account for so many hundreds remaining; they seemed to have been preserved even through all alterations of style. The Norman period of architecture, so bold and assertive, although existing barely a century, gradually changed into a style when the masses of stonework were broken up into smaller surfaces, and when another manner of decoration by sculpture came into use. Gradually thrusts and stresses were understood; and while the utilitarian might urge that a needless waste of material occurred in the earlier work, it must remain, to those who were privileged to admire even the mutilated remains of these masterpieces of architecture, somewhat a question of the trend of the mind of the spectator. Could they see the interior of one of these old minsters, with its dimly-lit choir and altar high up nestling amongst a cluster of columns, the massive wooden roof, all strong with heavy oaken timber, besprinkled with quaintly-devised patterns in strong colour, with curiously-wrought devices worked in glass, and, indeed, the building in its entirety, then, and not until then, could Norman architecture be said to be presented aright to their judgment.

OUR TECHNICAL LITERATURE.

BY X.

THOSE who have had occasion to look up written "authorities" upon any branch of practical building have, no doubt, been made painfully aware of the scarcity of really comprehensive and useful works upon the subject of their study, or at least, the inadequacy of such books as they may find. Let me not be misunderstood. Of works of a class that emanate from the college or the laboratory (including those dealing with the various departments of mechanics and the physical characteristics of building materials) we have an embarrassing abundance, consisting for the most part of works of accuracy and completeness, while electricity has been dealt with in an equally amazing array of books, good, bad and indifferent. But of comprehensive and trustworthy books on actual building practice fit to place in the hands of our students and practical workers—which books are the subject of this article—there is both great scarcity and pressing need. The Government has done much to aid the student, but it has left the most essential element—books—to chance writers, whereas it should have been their first duty to produce at any cost such important factors in the progress of civilization. I am aware that our Transatlantic friends have given us several excellent practical treatises—and those students able to take advantage of German and French publications will find several very instructive works in those languages—but even these do not fill the gaps or meet "the long-felt want" in our educational circles. We have, it is true, a few very carefully compiled general text-books, designed as class books to suit certain progressive "courses" of study as laid down by the Science and Art Department; but these books are compilations only, and cannot by any stretch of imagination be counted as "authorities." Their scope is necessarily limited, and their information scrappy, inconclusive and often inaccurate. They are very suitable for the man whose course is coached and whose aim is "to pass," but the genuine student with a higher object in study is all too soon worried by their inconclusive theorems and anomalies, and often driven by them to repeat that venerable and still unanswered question, "What is Truth?" It is at this point that his necessity for proper "authorities" arises. He should be able immediately to refer to some accredited work or works, and so clear up his difficulties. Let him try it now, and in the majority of cases he will either fail to find what he wants, or find only that which will puzzle him the more. I am writing from sad experience. Incredible as it may seem (just to illustrate my point with one case), it is nevertheless a fact that there was not an English work worth reading on the subject of the ancient and wide-spread craft of plastering until Mr. Millar produced his recent work. The need that existed for such a work was demonstrated by, as I am informed, the almost immediate exhaustion of the first edition; and that other countries were similarly pressed was indicated by the large number of copies of the book that have been sent to the technical schools of Germany and elsewhere. There are several most excellent and complete books on practical plumbing, both English and American, and two or three good works dealing with other branches of the building trade, but the cycle is very incomplete; and as long as it remains so, so long will the rising generations of students be handicapped. No one should expect or desire a smoothly-paved royal road to learning, still less one that is "coach"-ridden; a rough road stimulates attention, and is not so readily forgotten as a smooth one; but it is the impassable chasms that need to be bridged, so that the road may be at least possible to those who would climb it.

Fifty years ago we reared our craftsmen differently. Knowledge was private property; it was bought and sold like other purchasable articles, and transferred in whispers to those who bound themselves by deed to keep the secrets—such as they were—inviolate. I can remember when every joiner's shop had its lock-up sanctum for the learned staircase hand and for other branches who made mysteries of their craft. In those days, too, magistrates had their regular morning batch of refractory apprentices much as they now have their "drunk and disorderlies," and the few books that were available, though useful as far as they went, were ridiculously imperfect and inadequate. But we have changed all that. The secrets are published from the house-tops, and the poorest student can have free access to all that our forefathers guarded so jealously. "Indentures," which used to be the "open sesame" to employment, are now seldom or never asked for in engaging a "hand"; and our modern technical classes and colleges (and more particularly the cheap books and the free library) are gradually subverting the older custom. Yet, however good and numerous the means of personal teaching, it is the book which is the student's best friend; and when our technical literature, now in its infancy, shall have grown to a useful and more complete manhood, it will become an all-powerful aid.

THE FORUM FLOODED, 1900; LOOKING TOWARDS THE COLOSSEUM.

TEMPLE OF SATURN, THE FORUM, ROME.

Who does not remember as a youth the confidence he placed in any printed technical information that came to him, and the awe with which he regarded the profound wisdom and learning of his preceptors. A single statement at such a time would influence his opinions and judgments for good or harm for many years after, so that one cannot overstate the importance of having teachers that are capable and books that are trustworthy; but doubly so the latter, for if we have the proper books there will be much less excuse for badly-informed teachers. One could hardly estimate the enormous influence for good that a really good technical book has upon national progress. It has hardly been thought of, much less calculated, but if this fact could only be fully appreciated the establishment of a complete technical library of the very best possible kind would soon be recognised as a national duty and a *sine quâ non* to the national welfare. That such a library is possible even in the present generation there can be no doubt, for never before were practical men more capable or better educated. Is it not, then, high time that the present *laisser faire* policy of book-producing were abandoned in favour of some systematic policy? Why cannot the right men be sought out and set to work on the construction of a library of such urgency and importance, and, one might almost add, on the destruction of the stumbling blocks in the way of technical literature that publishers still continue to advertise?

I may divide our possible authors into three classes:—(1) Those who know and don't write; (2) those who write and don't know; and (3) those who both know and write.

Anyone who is tolerably well-connected in building circles will easily be able to attach for himself a list of names to each of these classes.

(1) The first-named class includes those who (as suggested) should be "sought out and set to work." Very many clever and skilful men are here, but unfortunately they have but a limited influence over the world of students; they hide their light under a bushel, and it is buried with them. Even if they had the inclination they cannot afford the time to give the world the benefit of their experience—unless, of course, they made it their business to write—and if they did that they would be justified in expecting compensation for their time and labour commensurate with that which they would have received from their business so sacrificed.

(2) The second division is a motley crew, including almost every class of person. Among them is the young architect, whose brass plate is painfully new, passing the hours of weary waiting for business, and hoping, like his relative, the briefless barrister, to catch clients by writing a book. He may serve his immediate purpose, but cannot serve the community in that way; such a book, fortunately, is likely to die young. Then there is the versatile journalist who would write about the construction of a cathedral or the breeding of pigs with equal facility, but his brilliant articles, while they scintillate like fireworks, like them leave nothing behind. Another type is the young man who has succeeded in passing his first examination. It is enough. He forthwith starts in business as a professional "coach." To obtain prestige he writes a book, and he will venture to answer queries in trade journals upon practical subjects of which he has only a paper acquaintance. It is easy for any enquirer to obtain learned answers from this gentleman when the question is within the four corners of a text-book, but when a

BAS-RELIEF IN MARBLE: ANIMALS "PREPARED FOR SACRIFICE."

PART OF THIS BAS-RELIEF.

practical difficulty is propounded the answers are often *pour faire rire*, unless he is canny enough to hedge.

Less harmful and more honest is the man entirely outside the profession who works on a hobby and writes about it. If, like Mr. Charles Hood, the barrister, who wrote a work on hot-water circulation, he confines his remarks to what he really know his work, like that gentleman's, may become useful. But the temptation of such men is to go beyond their experience and at once to bring discredit upon the more valuable portion of their work. Finally, the worst type of all is that of the man who has earned a name for his knowledge and attainments in certain branches, but who is indiscreet enough to prostrate his good name and risk his reputation upon subjects of which he has but a nodding acquaintance. The further that technical knowledge advances, the narrower must become the range of subjects to any one professor—be he author or teacher—if he would do full justice to the subject of his choice.

(3) The third class is a small one. It consists for the most part of busy men who manage somehow to find time to do something to help others, although the element of charity does not always enter into their motives for writing. One man may wish to extend his present position and influence by a technical work, intended as a species of advertisement; another may be ambitious simply to leave a name behind him. But in either or any case, if the subject chosen happens to fill a want and his work is the result of long experience and painstaking effort, the world will be thereby the better. The best results have been obtained by men who have been keenly conscious of the need of a book, who through years of careful observation and hard-earned experience have spared neither pains nor expense to perfect their design and to gather together the materials for what is generally almost a life-work. Any book that is to make its influence felt is bound to involve so much personal sacrifice that, in the present state of things, there can be little hope of anything like an adequate reward unless it be of that kind that feeds the soul rather than the stomach; and happy is the author whose heart is great enough for him to be amply satisfied with such a reward.

But why, when so much public money is spent upon education, should we have to depend upon charity and chance for our essential literature—that which is and is to be the anchor and safeguard of education? These things ought not to continue to stand where they are, for the remedy is easy, though it may take some time to become an accomplished fact—a sufficient reason why it should be commenced at once. I admit that my proposal may be open to objection, but so is every proposal involving expense. Let the Educational Department form a Commission with ample powers to gather together a band of technical experts, gathered, not simply from existing technical schools but from amongst the men who are in actual practice, regardless of nationality. "Those that know" should be found; and if they are unwilling to sacrifice a lucrative business or profession for the sake of the general good, they should be offered sufficient inducement to enable them to do so. No sum of money should be considered too great that may be necessary to obtain the book that is really wanted, for when such a book is once written its influence will be far-reaching, and may be an endless boon to thousands of teachers, to say nothing of the students themselves.

Let such a Commission collate and examine the existing technical literature and find and engage experts to write full and accurate works upon all those matters and branches of trade that are not yet adequately represented in literature, and thus establish—what we really ought to possess—a complete library of sound and trustworthy technical and trade information.

ROYAL INSTITUTE OF ARCHITECTS OF IRELAND.

THE Royal Institute of Architects of Ireland held its annual meeting recently.

Mr. G. C. Ashlin, R.H.A., the newly-elected president, took the chair, and said that coming after the long and successful presidency of Sir Thomas Drew, during which the interests of the Institute were so much advanced, he thought that his task would not be an easy one, except he could rely on the consideration of the Council. Continuing, he deprecated the practice which had sprung up of late amongst public companies, who had their headquarters in London or elsewhere in employing architects who were not in practice in Ireland to erect buildings in Dublin.

He then referred to the possibility of the revival of the ancient arts of Ireland and their adaptation to our modern circumstances. An eminent French writer said: "The Irish monks exercised a considerable influence on Continental Art down to the days of Charlemagne in the monuments of the Romanesque movement." Other competent authorities had borne similar testimony to the work of their fellow countrymen of that time over the whole of Europe, so that it might be safely affirmed that there existed for a long period a distinctive national school of Irish Art capable of immense development. The national progress of this school was unfortunately arrested in Ireland by extraneous circumstances, but they still possessed many examples all over the country which compared favourably, especially in delicacy of treatment, with contemporary Romanesque art in other countries. Although the buildings that remained in Ireland in this style were comparatively few and small, they contained the germs of a pure and original type of monumental art, and sufficient to guide them over the whole field of its building and decoration. Hitherto the efforts of their artists and architects had been mainly confined to the development of this style in such minor matters as sepulchral monuments, Celtic crosses, and illuminated addresses. Now, however, when there had arisen in Ireland such a pronounced desire amongst the public to foster all the distinctive features of their national life it appeared opportune that an attempt should be made to carry out the principle in their own important monumental buildings. He threw out the suggestion that the next subject for competition offered to the Architectural Association of Ireland might be for the design of a church, taking Cormac's Chapel at Cashel as a type, modified to suit their present ideas, and the facilities in materials and construction they enjoyed.

He then spoke of the difficulties in connection with ecclesiastical work which were experienced in finding artificers in Ireland with the necessary training and equipment for carrying out the ideas of their clients, and to improve the present condition of affairs help had been promised by their public departments, and especially by the technical schools, and he thought that still further assistance might be given if prizes were offered at the Cork Exhibition for specimens of work for which there was now a constant demand.

The secretary (Mr. W. Kaye Parry) read the annual report, which stated the satisfaction that has been felt at the inauguration of the Ulster Society of Architects, a body affiliated to their own, and formed for the purpose of organising the architects of the Northern province on the same lines as their own institute.

In consequence of the refusal of the Ennis Asylum Board, in the proposed competition for the extensive additional buildings, to appoint as assessor an architect who should have power to amend the faulty conditions of the competition, the Council advised the members of the Institute to abstain from taking part in the competition, and they were glad to say that the members loyally supported the action of the Council in this matter. During the year they lost no members through death, while, on the other hand, they had gained a considerable number of new members, the total now standing at 101.

Mr. J. Rawson Carroll proposed the adoption of the report. Mr. William M. Mitchell, R.H.A., seconded. The report was adopted. Mr. Batchelor, in the absence of Mr. Owen, presented the finance account, which showed that there was a balance of £66 5s. in hand. This also was adopted. The following were elected on the Council: Sir Thomas Drew, Messrs. W. M. Mitchell, J. H. Carroll, C. Geoghegan, F. Batchelor, R. C. Orpen, H. Pentland, A. E. Murray, G. Sheridan. This concluded the business of the meeting. The annual dinner followed in the evening. Mr. G. C. Ashlin, president, occupied the chair.

The Sullivan Memorial.—Mr. Goscombe John, A.R.A., has been commissioned to execute the Sir Arthur Sullivan memorial. A statue of some form to be decided will be placed in the south aisle of St. Paul's Cathedral.

THE BRITISH FIRE PREVENTION COMMITTEE.

THE official report of the International Fire Congress held in Berlin last June, which has recently been issued, contains in full the paper read by Mr. Edwin O. Sachs on "The Organization of the British Fire Prevention Committee and its Investigations with Fire-resisting Materials"; and as this is the first complete description which has yet been published of the general principles, working and finance of the Committee's testing station at 66, Porchester Road, Westbourne Park, we think it will be of interest to give some extracts from it.

After pointing out that the main subject work of the Committee was, firstly, fire prevention pure and simple, and, secondly, fire research—its sphere not being intended to include what is generally termed "fire combating" or "fire-extinguishing"—Mr. Sachs said the Committee was formed after the Paris Charity Bazaar fire and the great Cripplegate fire in London, in both of which cases it was obvious to the world that the subject of fire prevention was really in its infancy. The Committee was formed, first as an ordinary private society, and afterwards as an incorporated committee, with a membership of some five hundred professional men, and the necessary funds for the ordinary secretarial work of the Committee were raised by a regular annual subscription among the members and by voluntary contributions.

A Council of influential members was formed, an Executive, and also a number of sub-committees, and the necessary staff of assistants was engaged, comprising a secretary, assistant secretary, engineer and clerk.

The tests which have been organised by the British Fire Prevention Committee have been limited to obtaining reliable data as to the exact fire resistance of various materials and systems of construction, or appliances used in actual building-practice in Great Britain, or, in other words, they have been limited so far to obtaining results bearing on the everyday practice of the building world in this country, rather than to dealing with theoretical work.

The reason that this should have been necessary or that these investigations should have been necessary at all is, that sufficient data does not exist as to our methods of building construction, and that the little information available has, to a very considerable extent, been obtained by individual makers or manufacturers in their own laboratories, and that the results thus obtained have not been received with much confidence. The few official tests that have so far been undertaken in the United States and in Germany have not been systematically organized, but have simply had the object, as a rule, of dealing with certain specific questions or a certain specific piece of material, employed in a particular building, rather than of treating the question of fire prevention as a whole.

The series of tests undertaken by the Committee hence not only fills "a long-felt want," but gives the fire-prevention trades an opportunity of obtaining authentic records as to the liability of their work. The tests are of an entirely independent character, arranged on scientific lines, but with full consideration for the practical purpose in view, and all reports on them state solely the bare facts and occurrences, with tables, diagrams and illustrations, and on no occount include expressions of opinion, nor should any phrase be read as a comparison or criticism.

With regard to the financial aspect of the testing station at Westbourne Park, the establishment expenses were intended to be met by a special subscription, but as a matter of fact by no means sufficient subscriptions have as yet reached the Committee to meet the initial outlay, which was very heavy. As far as the funds of the Committee permit, investigations with ordinary (*i.e.*, not patented) forms of construction are undertaken from time to time and duly reported on. Official tests with patented materials, makers' systems, &c., &c., are subject to a scale of charges intended to just cover the actual cost. The testing station is also open to members for such private research-work or tests as they may desire to undertake at nominal charges for loan of plant and instruments. The services of the members participating in the management of the station, conducting or attending tests, are, of course, given entirely gratuitously.

The plant actually completed comprises a set of testing huts in which floors, partitions, doors or ceilings can be tested. The huts are laid down in two rows and are built of stock bricks with lime mortar. The fuel used is gas, produced on the spot by a generator supplied by Messrs. Mason, of Longsight, Manchester.

Each chamber for a floor test allows for the floor under investigation to be placed at least 7ft. 6in. above the floor of the hut, and the chambers are roofed in with galvanised iron, or tarpaulin, when necessary. Bricks or pig-iron are used for any loads that may be applied to floors under investigation, and water is applied from an ordinary manual pump, equipped with pressure gauge. Records of temperatures are taken, as far as possible automatically, by electrical pyrometers designed by Professor Roberts-Austen, of the Royal Mint, and are able to record temperatures up to 2,500 deg. Fahr.

In respect to the ordinary building materials or forms of construction which are not subject to any patent or the interest of any special maker, investigations as to their fire-resistance are undertaken from time to time according to means at the disposal of the Executive for such purposes. It rests with the Executive, either on their own initative or at the instigation of others, to arrange for tests of this description, and it is hoped that the various public authorities interested in the subject will, in due course, contribute financially towards the costs of such experiments as they may consider of general public utility.

The Executive hope, in due course, to be able to record the exact resistance of all the more common methods of construction used in the British Isles.

As already indicated, quite irrespective of the tests undertaken by the Committee with work that is not subject to patents, or not the speciality of individual makers, the fireproofing trade also have every opportunity for obtaining official and independent reports on their systems of appliances at a fixed tariff, the charges being based on the actual cost of such tests. Should the Executive find that these testing charges leave any material surplus, such surplus will be utilised for such purposes as the Commercial Section may direct, this section, as it will be remembered, being representative of the fireproofing trade of Great Britain, and organized under the auspices of the Committee, some forty-five firms and others interested in the trade aspect of fire prevention participating in the operations. There is, however, very little likelihood of a surplus in the near future owing to initial expenses not yet having been met, and with the increasing severity and longer duration of tests the cost of each experiment has naturally risen.

The tariff of charges to cover costs may be taken to read as follows for ordinary tests, the figures for purposes of finance being divided into (1) preliminary expenses, (2) establishment charges, (3) testing charges:—

All firms or individuals not members of a firm desiring tests must in future contribute a donation of £5 5s. to the preliminary expenses incurred by the British Fire Prevention Committee in forming the station.

All firms or individuals desiring tests must contribute to the establishment capital of the station from £10 to £50, according to the nature of the test and the group to which it belongs.

All firms desiring tests must pay in form of testing charges from £50 to £150, according to the nature of the test and the group to which it belongs, as defined below.

These contributions and charges are intended to cover all expenses for ground, carcass, walls, ovens or heating apparatus, instruments, firing, loading, water, attendance and supervision, and on no account shall any other expense be incurred; gratuities to the servants of the Committee, for instance, being strictly prohibited. No responsibility for breakage of instruments, &c., is incurred, an item which frequently costs the Committee very large sums.

The firm or individual having work tested must supply and fix his materials, systems or appliances at his own cost, everything pertaining to the actual test being covered by his contributions as per scale.

When second tests are desired by the same firm or individual, the testing charge—no matter in what group—will be according to scale, but there will be no further contribution to the establishment-capital or preliminary expenses. Where three or more tests are undertaken for the same firm or individual a discount of 10 per cent. off the scale-charges will further be allowed. All contributions are payable in advance at such times as the Executive shall determine.

Before any test with any materials, system or appliance is started, or the arrangements for such a test are commenced, all contributions must have been paid in advance, and the ordinary application for a test must have been supplemented by an undertaking on the part of the firm or individual desiring the test to accept all or any reports of the Committee, framed on the lines indicated above, and further to permit the Executive to issue such reports. The undertaking must be on a form obtainable at the offices of the Committee. Any firm or individual, however, desiring to see the report on a test with his work prior to issue will always have an opportunity given him for this purpose.

Under exceptional circumstances, at the discretion of the Executive and under special conditions to be determined on, tests may be undertaken elsewhere than on the Committee's grounds.

Quite irrespective of the independent tests, the testing grounds are, under special conditions, available to members of the section for private experiments, private investigations, &c., and research work of a private character.

As regards the loan of ground or space at the testing station for private full-size or laboratory tests of an experimental nature, a scale of charges will in due course be arranged according to which the members of the section will be able to avail themselves of the accommodation, instruments, &c., at moderate rates. Every encouragement and facility will be afforded to members undertaking research or experimental work. Such tests have, however, to be conducted purely as private tests, and no report on investigations of this description may be issued by the maker, as it is of the utmost importance that the only reports issued in respect to work carried on at the testing station should relate to the official tests conducted under the auspices of the Committee.

Many of the particulars shown in extracts given above have, we believe, not been known outside the membership of the Committee before, more especially those relating to the financial side. As with most new scientific institutions, there must necessarily be great difficulty in the first few years to make ends meet; and we may assume from the remark as to the initial outlay of the start not yet having been met that there must be deficit in that direction, and a fairly substantial one, for there is nothing more expensive than research work. It speaks well for the Executive that they have, as we believe, made ends meet by personally giving very considerable financial assistance; but now that the institution is an established one, it would almost seem time to call upon the public authorities and learned societies to help monetarily in the investigations which deal with unpatented articles, whilst the testors interested in patented work should put their hands in their pockets and clear off the deficit incurred in work from which so many of them have materially benefited.

What the views of the Berlin Congress were as to official financial assistance for the general investigations was, we hold, quite plainly put in the following resolution, passed unanimously (the membership of the Congress comprising about 2,000 architects, engineers, insurance officers and firemen from all parts of the world): "That the serious investigations of the fire-resistance of materials and systems of construction should be supported both by the Government and local authorities, as well as by such of the technical societies to whose membership the result of investigations of this description are of importance in the practice of their respective professions."

Lant Street Board School, Southwark, has been improved by the addition of three large halls for the use of each department for the purposes of prayers, gymnastic exercises, &c.

Law Cases.

Important Ancient Lights Appeal Case.—The case of *Home and Colonial Stores, Ltd.*, v. *Colls* was heard before the Court of Appeal on December 20th. The plaintiffs claimed an injunction to restrain the defendant from erecting on the site of 44, Worship Street, E.C., any building or erection so as to darken, injure or obstruct any of the ancient lights of the plaintiffs as the same were enjoyed previously to the taking down of 44, Worship Street. In delivering judgment Lord Justice Cozens-Hardy said: The action was tried by Mr. Justice Joyce in December, 1900. This is important, because at that date it had been laid down by Mr. Justice Wright, in *Warren* v. *Brown* (1900, 2 Q.B., 722), that the owner or occupier of a house has no legal right of action so long as he has left to him as much light as is ordinarily required for habitation or business, even though he has been deprived of a substantial amount of light and has thereby suffered substantial damage. Mr. Justice Wright's decision has recently been reversed by this Court, and the true rule of law with reference to the interference with ancient lights has been authoritively laid down thus: "If ancient lights are interfered with substantially, and real damage thereby ensues to tenant or owner, then that tenant or owner is entitled to relief." In this sentence "substantial" does not indicate any particular percentage. Without substantial interference there is no right of action, and, in addition, in order to obtain an injunction the plaintiff must establish substantial injury suffered or threatened. There is no standard or fixed amount of light to which alone a plaintiff is entitled. He must not be fanciful or fastidious. He must recognise the necessity of give-and-take in matters of this nature. It is settled that there is no rule of law that a man may always build up to an angle of 45 degs., but, in judging of the probable effect of a proposed building, the Court may not unreasonably regard the fact that an angle of 45 degs. will be left as *prima facie* evidence that there will be no substantial interference, and may require this presumption to be clearly rebutted by satisfactory evidence. This seems to be the result of the authorities. It remains to apply these general principles to the present case. We propose to accept without demur all the findings of fact by Mr Justice Joyce, where they are clear and only to refer to the evidence where there is no finding, or where, as it seems to us, there are inconsistent findings. His Lordship then proceeded to state the facts as found by Mr. Justice Joyce in his judgment, and, after reading the following passage from that judgment—"Various expert witnesses were examined, and as the result of their evidence I am of opinion that the proposed new building would not affect the selling or letting value of the plaintiffs' premises"—continued: If that means that an ordinary purchaser or lessee would be content to get a building having the usual amount of light enjoyed by similar houses in this part of London we see no reason to doubt it; but it is not a relevant statement. The plaintiffs are neither vendors nor lessees. They are occupiers; and their only desire is to use this room (a large room on the ground floor occupied by about ninety clerks) for the same purposes as heretofore and with the same advantages. And it seems to us impossible to hold that they will not suffer "real damage" if they have to consume and pay for more electric light than hitherto. As we read the judgment, it is a finding in favour of the plaintiffs that real damage would result, though light enough would be left for ordinary purposes of occupancy as a place of business, and there is no finding that the interference is not substantial. Now there was immediately opposite the windows in question what I may call "a gap," in width 36ft. and in height 13ft. 6in. The direct light which passed through this gap penetrated to a considerable depth into the plaintiffs' room. The interference with this light is "substantial" within the meaning in which the word is used. If we consider the judge's notes of the evidence the conclusion at which we have arrived is confirmed. In our opinion, on the balance of evidence, substantial interference and "real damage" will result; and the proper judgment would have been to grant an injunction in the settled form known as the *Yates* v. *Jack* form. But immediately after the action was dismissed with costs the plaintiffs gave notice of their intention to appeal. Notwithstanding this, the defendant has proceeded with and completed the erection of his building. Under these circumstances there is only one course open to us. We must reverse Mr. Justice Joyce's judgment and give the plaintiffs the judgment to which, according to our view, they were entitled. And we must grant a mandatory injunction requiring the defendant to pull down anything erected in breach of the terms of our injunction. This point was really decided by the Court of Appeal in *Parker* v. *First Avenue Hotel Co.* (24 Ch. D., 287). The defendant must pay the costs here and below. Lord Justice Vaughan Williams: The judgment which has just been read is the judgment of the Court; but I wish to add for myself that, so far as the rule of 45 degs. is concerned, I doubt very much whether that rule, as the law is now settled, can be regarded even as a rough measure of the right of the owner or occupier of ancient lights.

A Bristol Appeal Case.—In the King's Bench Division of the High Court of Justice Mr. Hudson recently appealed against a decision of the official referee, Mr. Pollock, in an action brought by Messrs. Llewellins & James, architects and engineers, of Bristol, in whose favour the referee gave judgment on the claim and counter-claim. His clients, Messrs. Humphries, were builders who entered into a contract to erect a building for the Friary Brewery Co. The contract was for £7,000, and was to be subject to the supply of certain foundry goods by the plaintiffs, who occupied the dual position of architects and sub-contractors, and had to make out the certificates as architects, which enabled them as engineers to draw money as the work proceeded. This naturally led to some friction, as the defendants complained that the certificates were too largely in favour of the plaintiffs work. The plaintiffs' claim was for a balance of £1,971, and the defendants disputed the amount of the claim, and also counter-claimed for damages for the non-completion of the sub-contract and for certain allowances. Mr. Sturges, on behalf of the plaintiffs, submitted that the decision of the referee was fully justified and ought not to be disturbed. The Lord Chief Justice said their lordships were not prepared to say that the decision of the referee was contrary to the weight of evidence, and therefore the appeal must be dismissed with costs.

A CARDIFF FIRE STATION.

A NEW FIRE BRIGADE STATION at Cardiff is to be erected in Westgate Street. The plans have been prepared by Mr. Harpur, the borough engineer. The buildings are estimated to cost £15,250. They will have a frontage of 140ft. in Westgate Street and 90ft. in Quay Street, and altogether will cover an area of 2,900 sq. yds. The ground floor will consist of a large engine-room providing accommodation for six engines, and the entrance to which will be from Westgate Street. The stables, consisting of six stalls and a loose box, are to be immediately at the rear of the engine-room, so that the horses can be brought directly to their positions in front of the engines. The call-room will be at the corner of Quay Street, and arrangements made to get it fitted up with the most approved electrical and telephonic apparatus. The chief engineer's quarters will face Westgate Street, and in the same block provision has been made for repairing, and workshops. The plans provide for a commodious block of firemen's dwellings in flats at the rear of the engine-house, providing accommodation for six married firemen and their families and for a number of single men. The first floor will include a large recreation-room and a reading-room, where the men on duty will always be found when wanted. As time means much in the case of fire, sliding-poles will be provided from the bedrooms and other rooms to the engine-room, down which the men may slide at a moment's notice and take their seats on the fire-engine. The flat roof over the stables is to be utilised as a yard for various purposes. The general sanitary arrangements have been well thought out, and are considered to be satisfactory. The doors of the fire-station are to be of the quick-opening pattern, which will open the moment the driver takes his place on the seat of the fire-engine and pulls a cord.

A New Wesleyan Sunday School at Strafford is being erected of yellow stock bricks with Bathstone dressings, and will be about 30ft. high. It will consist of a large class-room 50ft. by 40ft. and an infants' class-room 17ft. by 20ft., with church parlour and other rooms on the first floor. The cost is estimated at about £3,000. The architects are Messrs. Gordon & Gunton, and the builders Messrs. E. A. Roome & Co.

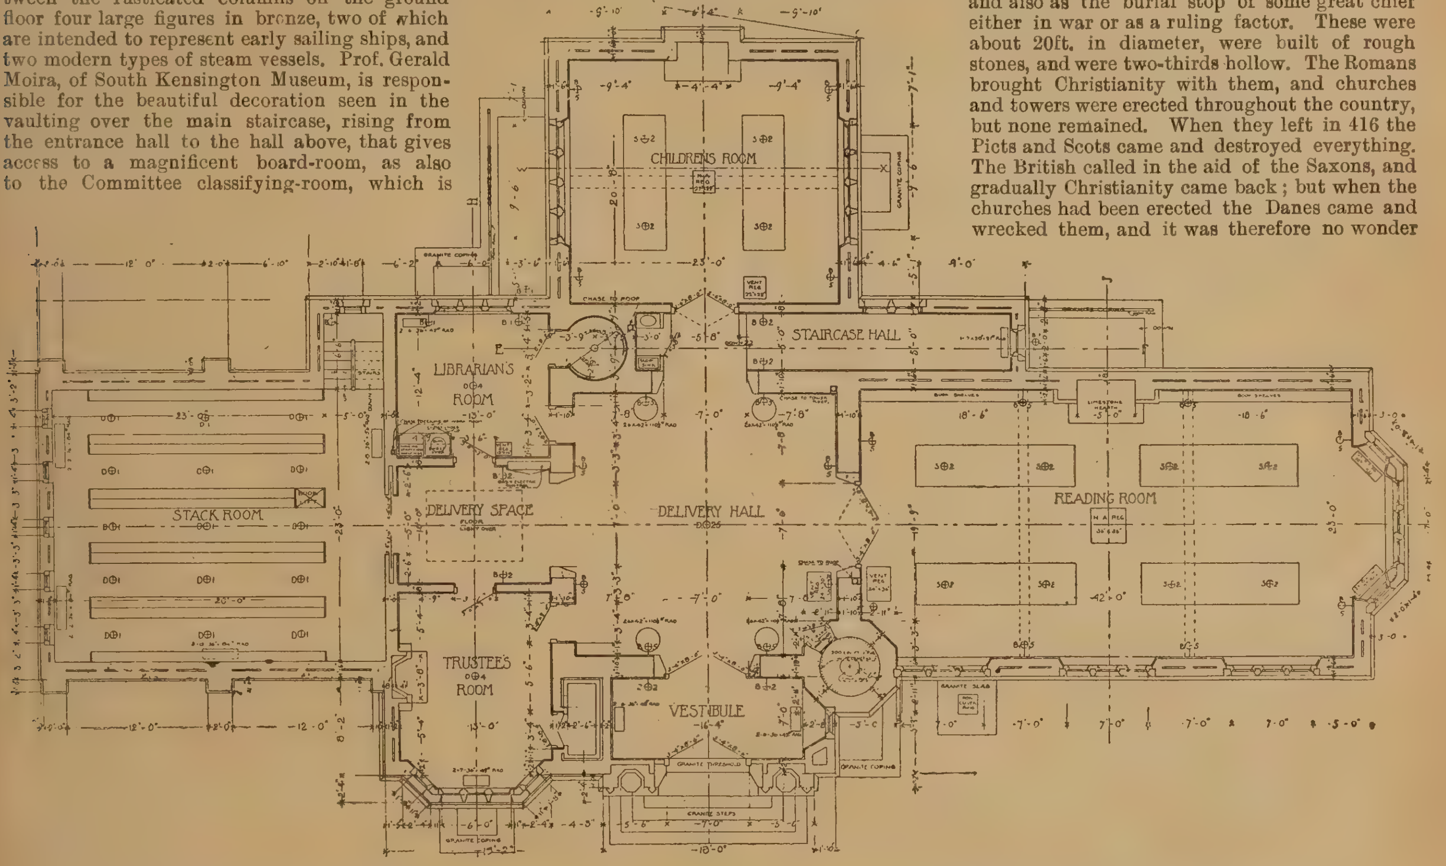
LLOYD'S.

THE business of Lloyd's Register has been transferred to the new building, which has just been erected in the City at the junction of Fenchurch Street and Lloyd's Avenue, from designs by Mr. T. E. Collcutt. In richness of ornamentation and decoration, there is, indeed, only one block of buildings devoted to commercial purposes in the City which can compare with the new structure, and that is the Hall of the Institute of Chartered Accountants, near Moorgate Street. Adopting the style of the Italian Renaissance, Mr. Collcutt called to his aid Mr. G. Frampton, A.R.A., for the execution of a sculptured frieze, which is a conspicuous feature in the imposing main façade of the premises that Lloyd's Register of British and Foreign Shipping will henceforth occupy. Mr. Frampton was also employed to introduce between the rusticated columns on the ground floor four large figures in bronze, two of which are intended to represent early sailing ships, and two modern types of steam vessels. Prof. Gerald Moira, of South Kensington Museum, is responsible for the beautiful decoration seen in the vaulting over the main staircase, rising from the entrance hall to the hall above, that gives access to a magnificent board-room, as also to the Committee classifying-room, which is panelled in oak grown and carved in Essex. The two halls mentioned are, with the staircase, built entirely of Devonshire marble of various tints, and the stairs are of Carrara marble. A frieze of striking design, by Mr. F. Lynn Jenkins, is carried round the walls of the upper hall. The interior walls of the board-room are composed of Numidian marble; black Belgian marble and Irish green marble being also used, and there is a dado of African mahogany with richly inlaid panels. Professor Moira is decorating this chamber in subjects emblematical of the sea, and Mr. Henry Pegram has carved in Carrara marble a centre panel for the large fireplace, resting on columns of the red marble still quarried in Egypt. There are several other valuable mantelpieces in the building, and one in Hoptonwood stone contains an artistic frieze by Mr. Bertie Pegram. The ceiling panels of the luncheon-room have been painted by Mr. E. J. Lambert; the ceiling itself, picked out in gold, being decorated with shells, anchors and other emblems of the deep. The fittings in all the principal rooms have been specially designed by the architect.



GROUND-FLOOR PLAN OF PUBLIC LIBRARY, NASHUA, NEW HAMPSHIRE, U.S.A. CRAM, GOODHUE AND FERGUSON, ARCHITECTS.

The Parish Church of St. James, Hereford, was totally destroyed by fire last week, the cause of the disaster being attributed to the heating apparatus setting fire to some adjoining woodwork. The church was built thirty years ago.

MODERN SCULPTURE.

AT a recent meeting of the Cardiff Naturalists' Society Mr. W. Goscombe John, A.R.A., gave a lecture on "Modern Sculpture." The lecture was divided into two parts—one a short but able and erudite summary of the history of sculpture, and the other a series of lantern illustrations showing many of the chief works, upon which the lecturer passed comments and gave explanations. Mr. Goscombe John, in reference to sculpture of the past, said he was afraid that some of the older samples of sculpture were arranged in museums upon chronological lines, like fossils, and the result was that many of their most beautiful characteristics were lost sight of. When the age of Greek art passed into decadence its effects were felt in Rome, where not only were samples of Greek sculpture obtained and preserved, but, what was better, they sought to learn its spirit. He attributed the commencement of the age of modern sculpture to Lorenzo Bernini, who, although his work was often flimsy and fantastic, did much work that had a great influence upon his successors. During the seventeenth century Rome was still the centre of the world of art. But leaders of schools of art arose in both France and Spain, each of which had its peculiar characteristics. Speaking generally, he said that sculpture must be "living," and represent the characteristics of the times during which it was done. The first great British sculptor was John Bacon, who was the leader of sculpture in England during the close of the eighteenth century. He was followed by Glaxman, who was one of the greatest of British sculptors. It was in France, however, that they found the most complete expression of sculpture. The characteristics of Greek sculpture was objective, whilst that of Rome was subjective. Both were the result of the religious tendencies of the different ages. The characteristic of modern sculpture, especially as represented in the French school, was life, movement, and human sentiment as apart from religious expression. At no period of the world's history had sculpture expressed the feelings of man towards man more than it had during the last seventy-five years. England would never approach foreign nations in the art of sculpture until the Government and the municipalities became interested patrons of the art. If an ordinary English town were compared with an average Continental town, it would be found that the foreigners put the English to shame. No country could excel in art unless it patronised its artists.

THE TOWERS OF CORNWALL.

UNDER the auspices of the Liskeard Literary Institution, Mr. E. Sedding, of Plymouth, recently delivered a lecture on the towers and churches of Cornwall. He said that in many parts these seemed more to have grown by the work of Nature than by the act of man. The first towers really consisted of a heap of stones, which were piled up, not for warlike purposes only but to commemorate the death and also as the burial stop of some great chief either in war or as a ruling factor. These were about 20ft. in diameter, were built of rough stones, and were two-thirds hollow. The Romans brought Christianity with them, and churches and towers were erected throughout the country, but none remained. When they left in 416 the Picts and Scots came and destroyed everything. The British called in the aid of the Saxons, and gradually Christianity came back; but when the churches had been erected the Danes came and wrecked them, and it was therefore no wonder that no relics were left. The advent of the Normans was propitious. They were born masons, and to-day there remained some of their splendid work at St. Germans, Bodmin and Tintagel. Festormel (Lostwithiel) and Launceston were very fine Norman keeps. Mr. Sedding showed some beautiful illustrations of churches and towers in Cornwall, the first being that of St. Germans. The next was that of the fascinating little church and tower of Tintagel; the latter consisting of three stages, as was also that at Forrabury (Boscastle); it was undoubtedly Norman. The towers erected with buttresses were before the fifteenth century. St. Teath (near Delabole) possessed a window, which was unusual. An illustration of Lostwithiel tower was shown; this was one of the finest in the county, and had been described as the "glory of Cornwall." Warbstow tower was of fourteenth-century date, as were also those of Michaelstow and Jacobstow. Morwenstow tower showed the finest Norman work in the county and the little church was built in a hollow with the moor all around it. The tower at Egloskerry (near Launceston) had been spoilt by someone placing a window and doorway of the whitest possible granite in it. A most interesting tower was that at St. Dominic, which looked as if the architect had reached a certain height and then decided to expand the top. The smallest church and tower in Cornwall was at Tremaine.

THE MERSEY DOCK BOARD OFFICES.

THE Mersey Dock Board have now passed the building plans for their new offices on the George's Dock site, Liverpool. This design by Messrs. Briggs & Wolstenholme, FF.R.I.B.A., 3, Lord Street, and Messrs. F. B. Hobbs, A.R.I.B.A., and A. Thornely, A.R.I.B.A., 14, Castle Street, Liverpool, and those of the architects who obtained the second and third prizes in the recent competition, Messrs. Woolfall & Eccles (second) and Mr. James A Cook (third), with various drawings showing the details of the respective schemes, were exhibited some time ago and excited much comment as well as a strong diversity of opinion as to their merits. It was known that the Dock Board had been guided in their decision upon the ten designs sent in by the advice of Mr. Alfred Waterhouse, R.A., and it was the superiority of the internal arrangements which led to a selection of the first premiated design, the position of the rates and dues and post entry departments being chiefly considered. These departments in the successful scheme are on the ground floor, with several entrances from James Street. All three premiated designs were in the Renaissance style—two of the English and one of the French Renaissance—and the architects of the first prize describe theirs as being that of the "Late English Renaissance treated in a simple and dignified manner. The two towers flanking the main entrance form prominent features in the design." On the west side the building is set back from the original line, and the block made rectangular in form. The land thus available, in addition to that specified to be left for ornamental grounds, provides a space capable of being treated more effectively than would otherwise be the case, and also enables an easy access for carts under the main building to the areas within for the supply of heavy goods generally to be provided. The main entrance is placed on the south-west front. The internal plan shows that the various departments are self-contained, with direct access and excellent lighting. As has been already said, the rates and dues departments are practically on the street-level, as are also the graving dock offices. The boardroom is on the first floor, as are also the offices of the general manager and secretary. The five storeys provide ample accommodation for all probable office requirements, but should necessity arise a sixth floor may easily be added without materially altering the design, while the architects state that the arrangement they have adopted has also this advantage, that the building above the first floor facing Brunswick Street need not be built until the accommodation is actually required. They propose that the whole of the frontage of the building should be faced with specially selected stone from the Grinshill or Dailey Dale quarries, while the walls of the areas would be faced with buff bricks and the roof covered with green Westmorland slates. In calculating the cost the foundations are put at over £13,000 and the superstructure at £257,246.

A New Volunteer Headquarters and Drill Hall at Eastbourne is proposed to be erected for the 1st Sussex R.E.V. The frontage of the new building to the road will be 80ft., but the full frontage of the land to the thoroughfare forming an extension of Ashford Road is 150ft. The front elevation will be of red bricks with stone dressings, with green-slated roof and tower; and the front part of the ground floor of the structure will include hall and vestibule, lavatory, officers' room, orderly-room, canteen, sergeants' mess. At the back the drill hall (with access from the front hall and side) will be 100ft. by 50ft., and there will also be a model shed, field works store, kitchen, clothing store and armoury. The side premises will consist of coal-shed, stable, magazine and lavatories; and the large open parade and drill yard will be 70ft. by 60ft. The first floor over the front portion of the ground floor will be approached by a good wide stairway. The room for the permanent staff will be 16ft. by 11ft., and the flat for caretaker will consist of two bedrooms, living-room and offices. The plans have been prepared by Major A. A. Oakden.

Engineering Notes.

The Gloucester-Diary and Directors' Calendar for 1902, published for the Gloucester Railway Carriage and Wagon Co., Ltd., gives, amongst other information, a number of interesting "Notes for Visitors to Gloucester."

The Additions to the Isolation Hospital, Aldershot, are being warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke flues and special vertical inlet tubes, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

Mr. Arthur Crompton Brown, A.M.I.C.E., chief agent and engineer at Seaham Harbour to Messrs. S. Pearson & Co., Ltd., contractors, of Westminster, who are constructing Lord Londonderry's new deep-water dock, was killed at the works last week. Mr. Brown was superintending the erection of a dam across the entrance to the south dock when a steam crane knocked him off the quay. He fell on to the dam, a distance of 20ft., and fractured his spine, death resulting in less than half-an-hour. Mr. Brown was forty-six years of age. He had carried out engineering works at Dover, in Derbyshire and at Portland.

Surveying and Sanitary Notes.

Mr. Charles A. Dawson, Local Government Board Inspector for the Northern District, including Northumberland, Durham and the North Riding of Yorkshire, died recently at the age of sixty-three years.

The Piccadilly Widening.—The question of the widening of Piccadilly came before the Westminster City Council recently. The Improvements Committee reported that there was not the slightest chance of the Crown assenting to the making of the new road through the Green Park parallel to Piccadilly. They, therefore, recommended the Council to approve the amended scheme, suggested by the First Commissioner of Works, for the widening of the thoroughfare from Hyde Park Corner to Down Street, such agreement to include the maintenance of the widened part. To this recommendation Sir John Wolfe Barry showed considerable opposition. He understood the new scheme would not be of the least use to the public, and would cost Westminster £870 a year to maintain. He moved an amendment to the effect that the Council would undertake the maintenance of the widened part of Piccadilly, but did not approve of it. This was carried.

Street-Paving and Property.—At a recent meeting the Town Improvement Committee of the Gateshead Town Council received a deputation from the Master Builders' and Property Owners' Association. Mr. N. G. P. Herdman introduced the deputation, and said the resolutions their Association had passed asked that owners of property be granted the right to pay for street-paving by fixed instalments if they desired. Workmen might be able to find a sufficient margin to purchase a house, but not the extra cost of £30 for paving, whereas they might take the risk if it were made a yearly payment of £4. This should be a fixed right and not a boon granted. If a builder could assure a timid investor that his paving, when done, might be paid for in small half-yearly instalments, his chance of selling would be much increased. Referring to the kind of pavement that should be used, he said whinstone-chip pavement had now but little to recommend it. Quietness, cleanliness and general comfort could be obtained by choosing other paving materials. They also suggested to the Council to urge upon those responsible for setting-out land to give them wide main thoroughfares capable of taking trams at one part, carriages and carts at another, and an avenue for foot-passengers. Asphalted avenues in the branch streets would be better than whinstone. Mr. J. A. Morris explained the proposed street plan, after which the chairman (Mr. R. Affleck) intimated that the subjects would receive the careful consideration of the Council. The Council, he added, were already arranging to take Parliamentary powers to more justly and fairly apportion the cost of street-paving.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Whitening Rough-Cast.

TWICKENHAM.—BROWN MADDER writes: "I wish to whiten some existing rough-cast, which is at present a brown colour, the washed gravel having been dashed on without being mixed with putty. I propose giving the work two coats of limewhite. Will this be suitable?"

See a reply to an enquiry on p. 440 of our issue of January 9th last.

Dealing with Waste Water.

LONDON, W.C.—REDHILL writes: "Can you suggest any better method of dealing with the waste water from the sinks only of four country cottages than draining it into a cesspool, with overflow, and pumping it up for use on gardens? There is no sewer in the neighbourhood to drain into. Rainwater is dealt with separately."

We would suggest that the waste water might be run into irrigation trenches direct on to the land in the gardens or fields, conducting it to them by glazed stoneware channels.

Books on Nonconformist Chapels and Schools.

LYTHAM.—W. L. writes: "What are the best books on Nonconformist churches and schools?"

We know of no book dealing especially with Nonconformist churches and schools. The usual and best method is to study the requirements of each congregation and to design a suitable modern building, and not to provide an archæological rehash. During the last fifty years the architectural periodicals have published a vast number of designs of churches for all denominations, which will, perhaps, aid you.

Competitions.

READING.—ENQUIRER writes: "A certain number of, say six, architects are invited by a Building Committee to send in competitive designs. Five decline, and the remaining one only accepts. Is the Committee morally bound to allow that one to complete his design and to adjudicate upon it, or are they at liberty to consider the whole matter *de novo*?"

We do not agree with competitions as a rule, and object to one like this in particular, as it causes needless waste of time, energy and money. We think the best plan would be to entrust the design to the architect who accepted. However, we do not think the Committee is morally bound to adjudicate upon his single design, but they should certainly ask him to compete in another competition, paying him for any work he may have done that will be wasted by any alteration of the conditions in the new competition. If the Committee decides not to have another competition, they should place the work in his hands.

An Old Architectural Book.

LONDON, W.—G. T. P. writes: "Where can I purchase 'Regle des Cinq Ordres d'Architecture de Jaques Barrosio de Vignole' (A.D. 1715), published in Amsterdam?"

A copy of this old book can only be obtained second-hand. You should make enquiries of booksellers and others. Mr. Batsford has no copy, but there is doubtless one in the British Museum which you could inspect.

"Manholes and Sewers."—In the reply to this enquiry on p. 312 of our issue of December 18th the size of the manhole was given as 2ft., whereas it should have been 3ft.

Bricklaying and Trade-Unionism.—"The Times" continues to publish numerous letters dealing with various aspects of this question; they form interesting reading, but do not break any fresh ground of importance.

Bricks and Mortar.

APHORISM FOR THE WEEK.

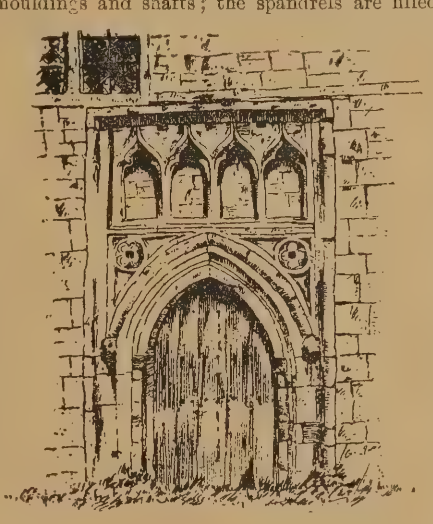
To look back to antiquity is one thing; to go back to it is another.—COTTON.

Our Plates. CHRIST CHURCH, HOLLOWAY, is now being erected by Messrs. Wildgoose, Matlock. The architect is Mr Kerry, of Derby and Nottingham. It is in Gothic style, cruciform in design, and will be built to accommodate 300 persons. It will be chiefly built of local Derbyshire gritstone. The foundation-stone is of Stancliffe stone. There will be a fine west window, and the square tower will be added at some future time.

Memorial to a Chester Architect. A BEAUTIFUL stained-glass window which has been erected to the memory of the late Mr. T. M. Lockwood, F.R.I.B.A., of Chester, in the historic church of St. John the Baptist, Chester, by the master-builders of Chester and district and kindred branches, was recently unveiled and dedicated. The window is the work of Messrs. Sprigley & Hunt, of Lancaster and London, and is rich in design and colour. Hiram of Tyre, the architect of the Temple and great metal-worker, is depicted standing on an architectural base under a canopied baldachin. He holds in his right hand a pair of compasses. The pillars on either side are those which he cast for the porch of the Temple, described in the 7th chapter of the First Book of Kings and called Jachin and Boaz. They are sketched from the pillar in Raphael's cartoon of St. Peter and St. John healing the cripple. The pillar is drawn from one in the Vatican Museum which was dug up on the site of Solomon's Temple and is undoubtedly of Hiram's design. The chapiters described in the Scriptures were too elaborate for the purpose of the memorial window, so the pillars are surmounted by angels, one holding the seven-branched candlestick and the other a model of Hiram's great laver supported by twelve oxen. The following inscription appears: "To the glory of God and in memory of Thomas Meakin Lockwood, architect, of this city, who died July 15th, 1900, the window is dedicated by the Chester Association of Master-Builders and others who were associated with him in his professional work." In the design are worked a number of Freemasonry emblems, the presence of which are due to the late Mr. Lockwood's prominent association with Masonry. The unveiling ceremony was performed by Mr. W. Vernon (Chairman of the Chester and District Master-Builders' Association), and the dedication prayers were said by Rev. Canon Cooper Scott (vicar).

A Famous Indian Archæologist. THE late Mr. Edmund William Smith, M.R.A.S., archæological surveyor of the North-Western Provinces and Oudh, whose death we referred to last week, joined the department as assistant architectural surveyor in 1886, and in that capacity made a detailed examination of the Mogul architecture of Fatehpur-Sikri, the ruined capital of Akhbar, the results of which were embodied in four handsome folio volumes, illustrated with photographic plates, and issued under the orders of Government. Another of his published works deals with the China-ke Rauza, a building to which exceptional interest and beauty are given by the exterior coating of rich tiles worked into innumerable designs. Mr. Smith succeeded Dr. Furher as the provincial head of his department and curator of Lucknow Museum in 1898. Long before Lord Curzon called attention to the responsibilities of the Indian Government in respect to the ancient buildings of the country, Sir Antony MacDonnell had adopted a liberal policy towards the archæological department in the provinces he ruled; and under his directions Mr. Smith accomplished a great deal during his all too brief tenure of the appointment in the restoration and conservation of ancient buildings. The famous Taj Mahal at Agra received special attention, and in executing the delicate restorations required Mr. Smith called into activity a vein of latent indigenous talent with excellent results, many of the artificers engaged claiming to be descended from those who were employed by Akhbar and Shahjehan. The squalid surroundings of the approach to the Taj, noticed by many travellers, have been removed by the conversion of the barren ravines and huts lying between that "dream in marble" and the Fort into a public park. Restoration on an extensive scale has been conducted by Mr. Smith at Fatehpur-Sikri, and the more important ancient buildings of Allahabad, Lucknow, Fyzabad and Bahraich were also repaired. A portfolio of architectural drawings, intended to influence for good Indian designs and workmanship by a return to ancient models, was in course of preparation by Mr. Smith.

Otham Church. OTHAM CHURCH, Kent, is dedicated to St. Nicholas. It consists of a nave with north aisle, a chancel with north chapel, and a tower on the south side of plain Early English work with small, narrow and obtuse apertures and a stair turret. Most of the windows are square-headed with Decorated tracery, but some are modern. The church was restored in 1873. In the chancel the windows are Perpendicular. The aisle is very narrow, and has one large pointed arch opening to the nave, and another to the chancel on octagonal pillars. The north doorway is a good specimen of Perpendicular, its arch having good mouldings and shafts; the spandrels are filled with quatrefoils; with a course of elegant panelling above, the whole included in a square compartment.



NORTH PORCH, OTHAM CHURCH, KENT.

Comments on the Kaiser's Speech. THAT the Kaiser's views on modern German sculpture (as reported on page 332 of our last issue) are not wholly acceptable to his subjects, the following extracts testify. The "Berliner Neueste Nachrichten" gives prominence to an article which traverses the view that German sculpture can be benefited by keeping itself clear of the influence of modern tendencies and movements. "German sculpture, on the contrary, requires to aim at progress in conception and in technique instead of clinging to traditions. Greatly as the conception of the Avenue of Victory is to be commended as one which, beyond being a tribute to the Sovereigns of the House of Hohenzollern, aims at preparing a halcyon period for German sculpture, the results which have been achieved by the sculptors who were selected have not, with a few well-known exceptions, been of epoch-making importance in the opinion of many artists and of a large section of the artistic public." The "Cologne Gazette" finds that "if all the Berlin sculptors together were weighed in one of the scales of art and Arnold Böcklin in the other there is scarcely any doubt that this single 'modern' artist would turn the balance." The "Frankfurter Zeitung" says: "Begas and his colleagues may well be pleased. The Avenue of Victory will make an overwhelming impression upon all the world. The Emperor has said it. All the puffing articles of all the newspapers in the world could not secure for these sculptors that 'vast respect' at home and abroad which the Emperor claims for them. The newspapers could not do this, simply because, as the Emperor thinks, they are wholly absorbed in puffing others—to wit, the modern artists."

Three Bills. THREE separate Bills bearing on important artistic problems of Rome and Italy in general are now before the Italian Parliament. One provides for the expropriation of the park known as Villa Borghese for £120,000, on condition that after expropriation it be given by the State to the municipality of Rome and that the municipality connect it with the public promenade on the Pincian Hill and call it Villa Humbert I. The second Bill authorises the purchase of the Borghese Gallery, situated inside the park, and founded by Cardinal Scipione Borghese. The Government proposes to pay £140,000 for the gallery. The same Bill proposes to create a large national art gallery within the park, and to transport thither, not only the present Borghese collection, but also the other art collections of Rome. The third Bill deals with the preservation of national monuments and with the trade in artistic objects. This Bill has been much modified during the discussion in the Senate, and has been weighted with a clause to the effect that it cannot be promulgated until a catalogue has been made of all pictures and other works of art which, being considered national monuments, may not be exported. Pending the re-presentation of the Bill next spring, the practical question of the trade in artistic objects remains untouched. Officials of the Fine Arts Department of the Italian Government are appointed to examine pictures and other objects sent in by dealers with a request for permission to export, but they judge them, not according to their real artistic merit, but according to the price which the dealer likes to put on them. Suppose a private individual buys for £1,000 a picture by an old Italian master from some Italian nobleman who may wish to dispose of it. If the purchaser is honest and tells the Fine Arts Department, when asking for permission to export, that he believes the picture to be worth £1,000 he is certain not to get permission. The Italian Government's "experts" will argue that a painting worth £1,000 must be a great work of art, and ought not, therefore, to be allowed to leave the country. If, on the other hand, the purchaser is wise enough to declare the value of the picture to be £10 he will not only get his permission, but will also pay proportionately less export duty. These things have happened over and over again. Public money is also wasted in useless litigation. It would be interesting to know how much the prosecution of Prince Chigi for selling his Botticcelli cost the Italian Government. Prince Chigi escaped with a fine of £3 or £4, and the Fine Arts Department looked ridiculous.

Mr. Onslow Ford. MR. ONSLOW FORD, the distinguished sculptor and Royal Academician, died suddenly last week at his residence in St. John's Wood. He was born in London in 1852. As a boy he showed both aptitude and desire for an artistic career, and in 1870 he went to Antwerp as a student of painting. From his Flemish masters he passed on to a German professor, Wagmüller, of Munich, who saw that his pupil's talent lay in the direction rather of the graver than of the brush. From that time Ford devoted himself to sculpture. He left the Munich schools in 1872, and in a few years he had become a regular exhibitor at the Royal Academy, had won a competition with the statue of Sir Rowland Hill which stands in the Royal Exchange, and found himself with no lack of well-paid commissions to execute. The earliest work of the sculptor's that attracted general attention was the seated statue of Sir Henry Irving as Hamlet. This was done in 1883, and is now in the Guildhall Art Gallery. The London public know Mr. Ford's work chiefly from the Strathnairn monument which stands in Knightsbridge just at the top of Sloane Street. At Oxford there is in University College the Shelley Memorial. Mr. Ford also did the Jowett Memorial, a fine piece of decoration in which mosaics and marble and conspicuous lettering help to make an effect. The Marlowe Memorial at Canterbury and the statue of Gordon upon a camel, which stands at Chatham, were two more efforts in this line which helped to make Onslow Ford's name. His aim was to blend the decorative and the realistic. Mr. Ford was elected A.R.A. in 1888 and R.A. in 1895.

Correspondence.

Army Works Reform.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—With reference to the above important subject, permit me to furnish the following examples of barrack scandals.

In an article on the "Reorganisation of the Royal Engineers," by a Royal Engineer officer, in the "United Service Magazine" for June 1900, this confession occurs: "It is notorious in the Army that the district work done by the Royal Engineers, whether in India or England, is of a very inferior nature. Indeed, the gibe is frequent: 'Those engineers again.' It has been asserted that barracks have been designed without foundations; houses without stairs; flues without draught; w.c.'s so built that no mortal can use them in safety; earth-closets so constructed as to shoot earth into one's lap; drains made to flow uphill; latrines built without drainage; forts erected that cannot be occupied by reason of damp; batteries placed where defence is impossible; magazines provided that are always full of water; doors made that will not close; windows inserted that cannot open; roofs put on that always leak; floors laid down that cannot be washed; billiard-rooms constructed not wide enough to admit of playing; ventilators put in that serve as smoke-traps; hollow walls authorised that act like sponges. These are some of the charges levelled at the Royal Engineers, and not without good grounds."

The following appeared in the number of "Modern Society" dated July 21st, 1894: "The electric light alterations at the Army Clothing Factory at Pimlico were estimated to cost £1,600. This sum has been found insufficient, and the bill runs up to £2,100. To provide accommodation for horses at Lusk, Dublin, £1,300 was asked for; this amount has now swollen to £2,100. On a like principle, £7,000 was the estimate for provision of a hospital at Edinburgh Castle. This has jumped up to £12,000. At the Isle of Wight the same old tune of insufficient cash is being played. To revise the battery at the Needles £,8000 was thought to be the height of extravagance. This sum has been topped, and £10,000 is going to melt away over this job. To reconstruct the drainage at Gravesend Barracks the estimate has been increased from £1,200 to £1,600. Who is responsible for these?"

The ensuing are only a few out of the many barrack failures which are occurring constantly, though the great majority never come to light:—

Aden.—The sappers built a swimming-bath at Aden which let the water in when it was not required and could not keep it in when it was wanted. The men are not allowed to bathe in the sea because it is full of sharks, and cannot use the bath because there is no water in it. A tank was also constructed, which similarly would not hold water. Aden is one of the hottest places known, and rain only falls about once every two years.

Aldershot.—The new barracks are ill-lit, being supplied with oil lamps only; they are unprovided with drying-rooms, where soldiers can air damp clothing; the hot water for the baths has to be provided by the soldiers at their own expense from the canteen funds; and some of the buildings are within a few hundred yards of the camp sewage farm.

The triennial contractor was recently struck off the list, but "Truth," in its issue of May 31st, 1900, stated: "In fact, the case, were it properly investigated, would afford valuable evidence of the corruption of military foremen of works, and the extent to which contractors are compelled, whether they like it or not, to concur in the fraudulent practices of these individuals." The sewage farm is celebrated. Dr. Seaton, Medical Officer of Health for Surrey, reported on July 31st, 1894, that it was rather a sewage marsh, with poisonous exhalations likely, if cholera visited this country, to prove of a most deadly nature. The Army Medical Department have repeatedly called the attention of the Royal Engineers to its dangers, but without avail. The latter proposed to build a large hospital within 200yds. of this sewage marsh, which has caused outbreaks of diphtheria. Mr. E. Bailey Denton, M.I.C.E., was next called in, and in July, 1895, severely reported upon its condition, declaring that the systematic neglect of years was apparent at every turn. The homestead was almost a ruin, and there was not a gate on the whole farm. The tanks at the outlets of the four outfall sewers, which were never of good design and were most unsuitable for the disposition of sludge, had fallen into decay and presented a disgraceful appearance, the large quantities of sludge collected in them giving off nauseating odours, and so on. Loss of life and health have resulted from the insanitary conditions connected with barracks and water-supply at Aldershot, although the whole camp has lately been rebuilt. A refuse-destructor was erected, which, after completion, was found to be too expensive to work and had to be standing idle.

Curragh.—This place is like Aldershot on a smaller scale, but, as usual, the building mistakes are unknown beyond the following ones of common report. The famous puddle reservoir was constructed under Colonel Bond, R.E., who spent most of his days hunting. It could not be made to hold water for five years, as the work had been done by sappers. At last English navvies had to be sent for, who were supplied by English contractors, when the tank was finally made water-tight by Mr. Woodman Hill, A.M.I.C.E. The original estimate was something like £600, while the final cost was nearly £3,000. To crown this, the reservoir has never been used, as the water was found to be unfit for drinking because the puddle clay was obtained from the sewage farm and was infested with bacteria. This sewage farm bids fair to rival that at Aldershot, being a few hundred yards to the windward of the camp, and is mostly a lake rather than a marsh. Officers' wives have become ill from eating vegetables grown on it. Concrete huts built by military labour have had to be finished by civilian contractors, owing to the length of time taken and by reason of the bad workmanship.

Gibraltar.—About ten years ago it was decided by the Royal Engineers to establish a battery of four 6in. guns near the summit of Gibraltar. It cost about £80,000 to carry out the work, and it was then discovered that 9in. guns were absolutely necessary to penetrate the armoured decks of passing vessels. The 6in. battery had consequently to be removed, and the larger guns substituted at still greater cost. While the Royal Engineers were removing, on February 20th last, a wooden frame supporting the tunnel at Genesta, at the south end of the rock, a portion of the brickwork collapsed, burying the labourers, four of whom were killed and three injured.

Malta.—The following appeared in a contemporary from the pen of a "Traveller":—Upon Imtarfa Hill, Malta, which commands the surrounding country, a vast group of new barracks was erected in 1891 at a cost of nearly half a million. It was to be expected that advantage would be taken of such a site and opportunity to construct a monument worthy of the late Queen's reign, and of which a travelling Englishman might feel proud, considering that labour and excellent building stone are so cheap in Malta that the most elaborate masonry only costs about 9d. per ft. cube. Yet this is what happened: Sketch plans to a small scale were prepared at the War Office, showing the proposed accommodation of the various buildings, and an assistant surveyor was detailed to Malta to elaborate the working drawings. This gentleman, who is a competent designer, naturally thought the one chance of his life had come, and hoped to be able to distinguish himself. A series of petty contracts were made with the native workmen for the erection of buildings, to be measured according to schedule as the work proceeded. The superintendence of the buildings was put in the hands of a captain R.E., whose fittest claim to such a responsible post was that he had had some experience in electrical engineering, but who esteemed himself able to carry out these works from the original sketches without any *professional* aid, and accordingly told the assistant surveyor that working detail drawings were quite unnecessary, and dispensed with his services. The captain R.E. then collaborated with the native workmen whenever details were required as the work proceeded, and the result naturally has been a series of abortions of designs and botches of construction absolutely shocking to a professionally-trained man. The local authorities were, however, so proud of their work that a series of official photographs was taken of the first buildings erected, and forwarded to the War Office for admiration. The letter, acknowledging their receipt, asked some ugly questions as to variations from the original sketches, and complimented the Commanding Royal Engineer on having perpetrated a series of architectural atrocities "unworthy even of a barbarous nation," and also observed that "it was evident that the R.E. officers in charge of works under the Barrack Act were not able to deal in a satisfactory manner with the details of architectural work," to reproduce the actual wording of the letter.—Last year, when some barrack building was being done at Malta, the Royal Engineer officers who had charge of the work were instructed to give certificates to the contractor from time to time to the extent of 75 per cent. of the value of the work done. While the work was still in progress they had issued certificates to an amount which exceeded the total of the contract by £345, and the paymaster paid the money. In the Auditor-General's report nothing was said about the cash having been recovered. I know one or two builders whose mouths will water for the opportunity of doing some work for the War Office under those same Engineer officers when they read this.

Mauritius.—A major R.E. caused some huts for the native troops to be thatched at so slight a slope that, although they were only up for six months, yet they were already rotten with rain which soaked through to the occupants beneath. There are nearly a hundred of these huts, and the roofs must be renewed. Thatched roofs mean liability to fire, especially in the Tropics, and in many Colonial towns they are absolutely prohibited. His successor was a captain, who confessed he knew nothing of works; still he has the handling of over £100,000 of public money. Barrack huts that were put up under him were not bolted down into the concrete foundations, and the amateur military architects both there and at the War Office would not admit the necessity. This in a place like Mauritius, famous for its hurricanes, in which the wind has a velocity exceeding a hundred miles an hour! The steel skeletons for these buildings came from England, and a mechanic was sent out by the War Office in 1900 to put them up. He was kept idling for five months before the Royal Engineers had the foundations of one hut ready for him. Then this captain sent the man home as useless, and the result was that one hut afterwards fell down during erection, killing three men and wounding oven a dozen.

Who will deny that the Army Works Department needs reform? A great many more examples of incompetence and waste could be mentioned, but I prefer that others would come forward with their experiences.—Yours truly,

BALBUS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—All interested public servants will thank you for devoting so much of your space to the above question, and your correspondent for so able a summary of the present situation. There is no doubt that the Committee now sitting is too small, and it is matter for grave regret that at least two Members of Parliament have not seats upon it; while, as the Royal Engineers have a representative, the civil staff should certainly have had one also. Members of this staff are frequently proved to be the only persons on the different stations who are competent to pass an intelligent opinion on matters connected with the construction of barracks or fortifications; and, therefore, although they are few in number, and are snubbed and kept in the rear by the officers under whom they have the misfortune to serve, the presence of one of them on the Committee would have been some guarantee to the public that the investigation would have been impartial. The writer greatly fears that this will not be the character of the verdict. Already the evidence given is known to Royal Engineers at different places; and, when the Christmas recess is over, there will it appears be a rally to the good old flag, and the R.E. *esprit de corps*, which is the antipodes of *esprit de patrie*, will be brought to bear in full force with a view to weaken or flatly deny any antagonistic evidence which has been given. There is a strong rumour that there will be no more evidence taken from the civilian staff, only three or four members of which have, it is said, been called. At any rate the number of witnesses examined should be equal from both sides—and it is an open secret that there *are* two sides—and statements made should be fully inquired into. It is immensely difficult to prove to such a man as Lord Esher that an officer can so far forget that he is supposed to be a gentleman as to come before the Committee and declare that he *does* actually design barrack buildings, and that he does *not* lean on the surveyor on the station for his opinions or knowledge of technical or professional business, which he is supposed to do himself. The civilian surveyor is the only man who is well enough informed in the matter to throw light upon the doings of the officers with and under whom he has served, and after all it is the *doings* which test everything.

Mr. Secretary Brodrick has the thing in his own hands. If he were to order an actual test of, say a dozen officers—some from each rank—the thing could be shown up in an afternoon; but he will never get at the truth by believing every statement of the R.E. officers who may go before Lord Esher's Committee, and do a little quiet gasconading as to their achievements both in the present and in the past.—Yours truly,

THOROUGH.

The Magistracy and Sanitation.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I notice the report in your issue of December 11th of Mr. Judge's dispute with the Hampstead Borough Council, and that gentleman's letter on the subject. While sympathising with the owner of the house on the waste of money for altering an efficient drain upon the magistrate's decree, I consider equally unnecessary expenditure is often insisted on by sanitary "experts." Judging by my own experience I have found it on the whole a decided advantage to have an appeal to a magistrate in checking faddist requisitions from such reports, as well as the autocratic dicta of over-zealous sanitary inspectors. Some of these last-named officials are so arrogant as to publicly express desire for the abolition of all control whatever. (See Report of Conference of Sanitary Institute, 1900.) What would be the effect of an autocracy composed of an unpractical M.D. as M.O.H., and one of the better class plumbers elevated to the position of sanitary inspector and seeking to magnify his office at the ratepayers' (his employers) expense, may well be imagined. On the other hand I do not hesitate to say that the unreasonable condemnation of existing house drains by so-called "Sanitary Engineers" has helped in promulgating fads, fancies and fallacies which cause waste of money. In many cases a uniform gradient is not necessary for efficient working—in others it may well be so. I have not yet had magisterial condemnation of a drain solely on that ground, but by the new by-laws of the L.C.C. we must expect this in the future, in some cases even necessitating a manhole of 10ft. deep or more if the public sewer is deep, and danger to the foundations by excavation of trenches in narrow places. This is a serious objection. A commonsense interpretation of the statutes by magistrates has certainly checked abuse of power by a Sanitary Department, and to do away with such a veto would be to avoid Scylla and fall into the Charybdis of official tyranny.—Yours truly,
E. W. HUDSON, A.R.I.B.A., F.S.I.

The Churchyard Cross at Harberton.

To the Editor of THE BUILDERS' JOURNAL.

EXETER.

SIR,—Your correspondent, in the note on "Crosses" on page 313 of your issue for December 18th, is mistaken in assuming that this cross (which is the finest of all our fifteenth-century graveyard crosses) has recently been restored by Sir Robert Harvey; and he is equally in error in the belief that Charles Kingsley was born at Harberton, or, indeed, anywhere in the immediate locality. Kingsley was born at Holne Vicarage (on the banks of the Dart, near its source on the southern fringe of Dartmoor). The church of St. Mary the Virgin at Holne contains the most interesting (oak) fifteenth-century pulpit in the country. At the investigation of the late Sir G. Gilbert Scott, R.A., I took plaster-casts of much of it, fully thirty-five years ago.

There are two ancient crosses at Harberton—both of the same date. The one already referred to stands near the south-western porch of St. Andrew's graveyard; the other is at the junction of some crossways outside the village. The latter is of Devonshire grey granite; the former, of local freestone. Both of them were carefully renovated by my sons and self during 1895, and early in 1896, under the direction of Mr. W. M. Tollitt, architect, of Totnes.

Mention is made in the same paragraph of the churchyard cross which we erected this year at St. Mary's, Haggerston, N.E. It may be worthy of record that this particular cross only got into its present position by a fluke. We made it for the donoress as a memorial to her late husband, a Cornish vicar, and it was destined to stand in the graveyard of St. Andrew, at Stratton in the north-east of Cornwall; but the present vicar did not agree with the donoress as to the site of his predecessor's cenotaph, and the upshot was the lady changed her mind, and by her directions we erected it where it now stands in North-east London.—Yours truly,

HARRY HEMS.

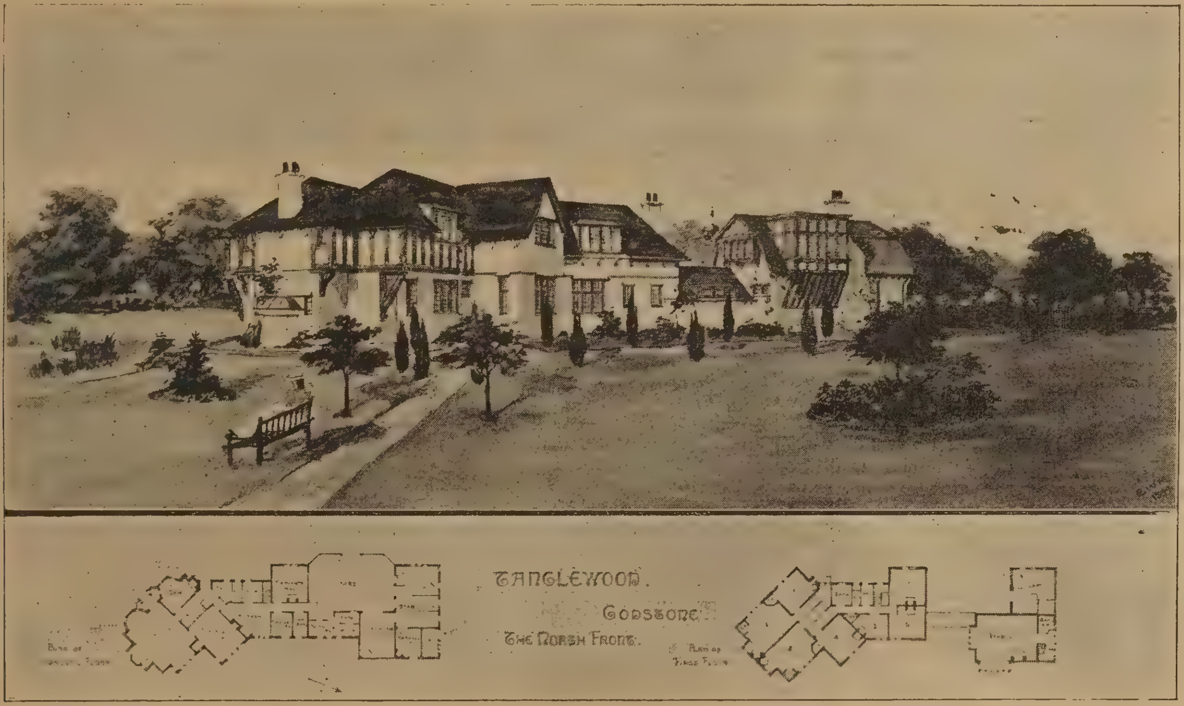
Masters and Men.

The Penrhyn Dispute. – One of the most remarkable points connected with the long-standing dispute at the Penrhyn quarries is the similarity of the claims of the men on strike to-day and those of the men who came out three-quarters of a century ago. Then, as now, the workers complained of inequality of wages, of favouritism at the quarries, of the alleged unfairness of officials, and of the oppression of the men.

Increase in Price of Slates.—Owing to the prolonged strike at the Penrhyn Quarry, and the further reduction in the output of slate consequent upon the large falls in other important quarries, slate producers and merchants have decided to increase the price of Carnarvonshire slates by 2½ per cent. or more, according to the demand. This has been promptly followed by a demand on the part of the Moeltryfan quarrymen, numbering between 400 and 500, for an increase of wages.

TANGLEWOOD, GODSTONE.

THIS house is built of local bricks, roughcasted an almost white colour. On the south front are three panels of open mosaic worked direct into the rough-cast, in a conventional representation of a "tangle" of orange and lemon trees. The constructional woodwork throughout is of oak, and the same wood is largely used in the panelling, &c., in the interior, while the floors are of teak. The plan has its back broken, partly for effect and partly that while the main length of the house should be parallel to the road, the private portion should stand looking across the ponds formed in the old clay workings to the view beyond. Mr. E. W. Marshall is the architect.



WOODS.*

THEIR STRUCTURE AND SELECTION.

By HERBERT STONE.

THE subject upon which I have the honour of addressing you is incomplete and, as yet, quite in its infancy. As a scientific study it is by no means new, but the technical application of it may be said to be comparatively recent, as might be expected, because a certain amount of progress must be made and sufficient methodically-arranged information must be accumulated before the commercial man can employ it usefully. In short, until science has something substantial to offer, which will stand the commercial test, it is far better to continue the use of the old rule-of-thumb methods, which, after all, have sufficed to make the world go round till now. Whether the art of discriminating the various species of timber has arrived at that desirable stage I must leave it to your judgment to decide, but I feel that a ventilation of the subject must be productive of good, and hope that it will arouse sufficient interest to bring recruits to this enquiry.

The Indefinite Knowledge of Woods.

The carpenter knows the woods he works with from continually handling them, and can, perhaps, distinguish a dozen or twenty of them with ease, but beyond these he is at sea. The timber merchant dealing in hardwoods has a longer list of familiar woods, and having spent his days amongst them he becomes an authority upon them. But the process of handing a strange piece of wood round until someone is found who knows it, is a part of the daily routine even at the oldest houses.

Many hundreds of consignments of excellent timber reach our shores, and failing sufficient information as to their name, origin and virtues, are passed by purchasers until they are finally relegated to a rummage sale, where all "unrated" timber is put up to auction for the purpose of recovering the freight and dock dues. Amongst these "unrated" woods have been many which have excited admiration for their beauty or other excellence, and in some cases have changed hands at fancy prices after the discovery of their value.

If you will look through any old list of hardwoods you will see the names of many that were familiar years ago, but which are not now met with. Did the consumption of the timber trade of the last generation exterminate these trees? I cannot believe it, for even if a small locality were entirely stripped of a species, there are few that are confined to such small areas. Possibly, if they grow elsewhere, and I hope that with the increasing means of identification which the anatomical characters afford, we may not only discover the species, but also indicate in what other regions a fresh supply of our lost timbers may be found.

Necessity for Authenticated Specimens.

To base this art upon a secure foundation, it is absolutely necessary to obtain authenticated specimens. One may describe the structure of the African oak, and it may be an advantage to identify other specimens of African oak from the description, but it will be useless for a purchaser to enquire for it under that name in localities where it is called African teak. With this view I have appealed to the Colonial Office for authenticated specimens of all Colonial timbers, so that their structure may be put on record, thus enabling not only our home traders to recognise unfamiliar Colonial timbers when they meet with them here, and to satisfy their wants by purchases from our brethren of Greater Britain, but also to enable our colonists to recognise their own woods for their own uses; for if experts are scarce in England they must be far rarer in new countries. Besides this, our settlers had a limited knowledge of English trees when they left our shores, consisting of a few names such as oak, beech, ash, elm, pine, &c., and every tree they met with in their new home became native oak, native beech, &c., with the variation of a few simple adjectives, such as red ash or black ash. When these become exhausted, the alternatives are red wood, white wood, yellow wood, iron wood, &c.; hence we must not be astonished to find that in different parts of Australia no fewer than five distinct species of eucalyptus pass under the name of red gum, and two or more under that of blue gum.

I have already obtained promises of authenticated specimens of the woods of Canada, the Cape of Good Hope, Victoria, Queensland, Western Australia, Lagos, and Rhodesia, and, with one or two exceptions, I have very little doubt that a similar response will be received from those Governments which have not yet replied. In my petition I have asked for a specimen of each wood sufficiently large to provide duplicates for several public institutions.

Annual Rings.

It must be clearly understood that the width of the annual rings, the most conspicuous feature in woods, is rarely of any value. A ring of oakwood may be $\frac{1}{4}$in. wide, or may reach $\frac{5}{8}$in., and the difference in the appearance of a piece of wood containing sixteen rings per inch of radius and another only showing two is exceedingly difficult to reconcile. This variation is merely a question of growth, and depends upon the fertility of the soil, &c., so that the extremes may frequently be present in the same piece of wood in the closest proximity. The full character of the structure is unfortunately only brought out in broad well-developed rings, and it is by no means rare to find a specimen with which nothing can be done, because no ring is broad enough to show the structure of the autumn wood. Search then always for the broadest ring.

Pores.

An essential point to be noticed is the presence or absence of true pores, which may be recognised by their abundance in the inner side of the ring. They are never more abundant in the autumn wood, even when uniformly occupying the whole section. If pores appear in the outer or middle part of the ring while the inner is free from them, be sure that they are resin pores, and that the wood you are dealing with is a conifer, and probably a pine or spruce. The rays are always present, even when microscopic, but they vary greatly in breadth, height, lustre, straightness, &c., each detail having its own particular value. A close examination of an oaken block will reveal a number of cloudy bands running concentrically with the annual rings. These are composed of wood parenchyma, or soft tissue as I shall call it, and are usually present in well-developed rings in all the oaks.

One of the difficulties of this study is the unending fluctuation of the size in the various parts. The variation which most meets the eye, that of the annual rings, has already been referred to. Next to this the coarseness of the pores chiefly affects the appearance of a wood. This depends more upon age than upon nourishment, and in many woods, such as the oak, the average size of the pores augments from year to year till the tree reaches its prime, and then becomes more or less constant. Other woods show their variation in a much less degree.

Age and Weight.

There is considerable harmony in the variation of the characters of wood, both physical and anatomical. The weight per cubic foot, the hardness, the state of saturation, amount of ash, the elasticity, &c., vary regularly, according to age and distance from the root of the tree. Weight is found to increase from the foot to the first branches, and then to decrease from that point upwards. The size of the rays, cells, and vessels, as already stated, increases with age, so that in the eightieth yearly ring of an oak, counting from the pith outwards, these parts will be much larger than in the first. It must be borne in mind that the eightieth ring was produced seventy-nine years later than the first, so that we must be careful not to confound the age of the tree with the age of its wood.

Similarly, inasmuch as the sapling oak of one year is but a fractional part of the weight of the mature tree, and as the growth in height has been caused by the super-position of additional coats of wood one upon another, like so many cones, it follows that the wood of the upper parts must be younger, and therefore the innermost ring of this upper wood must not be assumed to be old because of its position. It is natural to assume this, and many would count the rings on a piece of wood from the upper part of a trunk, and pronounce it to be of such and such an age, whereas that may not be within fifty years of the truth.

Many tropical woods show scarcely any perceptible division between the growth of one year and the next. Their growth seems free from any check, though it may vary in vigour. Hence the familiar ring-boundaries become vague or entirely lost; even the rise and fall in the size of the pores is frequently absent, and they seem to increase uninterruptedly from the pith outwards to the bark.

I think one obtains a more securely based conception of what wood is by commencing to study it in the solid instead of by macerations, or even thin sections. To study the cells first under high powers is, to my mind, beginning at the wrong end.

A Key.

For my own use I have constructed a key which will perhaps prove useful to others. As it seems to me, amongst the woods of the broad-leaved trees the rays are the most constant character. I base my divisions upon them, first separating those woods having two kinds of rays, as many cupuliferæ, from those which have but one. I then divide the latter into those whose rays are separated by intervals greater or less than the transverse diameter of their larger pores; that is to say, the intervals between some may be equal to the pore diameter at the most, and conversely in the other class the intervals may be equal to the pore diameter, but never less. Further sub-divisions, which it would be tedious to detail, are based upon the presence of soft tissue and its arrangement, followed by the arrangement of the pores, concluding with the degree of definiteness of the ring boundary.

Hardness: And an Instrument for Determining It.

In every description of wood, by a practical man the elements of weight, hardness and colour are considered. Sometimes the weight per cub. ft. is given, and the colour, apart from its fluctuations, is often accurately pictured, but the hardness is a quality which is practically left to our imagination. I have been so much impressed with the necessity of some means of measuring the degree of hardness that I have constructed an instrument which is capable of giving a fairly accurate reading of the resistance to impact of a wood (not of its hardness pure and simple, because the resistance to impact is made up of elasticity plus hardness), but it is a fair parallel to the impression of that which we call the hardness makes upon our sense of touch. I will not weary you with a description of this contrivance, but will merely mention that the principle is as follows: A steel ball of a known weight falling a definite distance upon a surface at an angle of half a right angle will fly off in a horizontal direction, and describe a curve or trajectory which will be longer or shorter according to the amount of force absorbed by the wood. A self-recording arrangement and all necessary adjustments are attached to the machine. The hard and soft zones of a wood give different readings, so that a number of trials have to be made and an average struck. I take the average of ten trials, displacing the wood five millimetres between each.

Municipal Buildings for Dorking.—The Dorking Urban Council have received a munificent offer from Lily, Duchess of Marlborough, which will enable the Council to carry out their idea of combining municipal offices and a new post-office in one building. Some time ago, with the full concurrence of the postal authorities, the Council drew up a scheme and had plans prepared for the erection of such a building, but the Local Government Board refused to sanction a loan on the local rates for a building which was to be used in part by a Government department. At this juncture her Grace purchased a site for £2,400, and offered to erect a building which will serve as a new post-office as well as Council offices. The Postmaster-General has agreed to take a lease of part of the premises for thirty years on terms similar to those previously arranged with the Council, and the Council have leased the remainder for a like period at £80.

---

* Summary of a paper read before the Society of Arts on December 4th, 1901.

Builders' Notes.

The Newport (Mon.) Master-Builders' Association held its annual dinner recently, Councillor W. M. Blackburn presiding.

St. Thomas is the patron of masons and architects, from the tradition that a large sum of money was given him to erect a palatial building, but he spent the money on the poor, thus building a palace in Heaven.

Mr. Thomas Axtell, of 17, Speedwell Street, Oxford, died recently at the age of seventy-five years. For many years the deceased was connected with the firm of Symm & Co., builders; and under his personal directions several important building operations in the University and colleges have been carried out.

Sheffield Builders' Exchange.—A complimentary dinner was given recently by the Sheffield Master-Builders to the workmen employed upon the new Builders' Exchange, which is being erected in Upper Charles Street. No time has been lost over the building, which will in all probability be ready for opening in May; the contractors have now got to the roof of the building. The new exchange, which will also serve the purposes of a club, is to cost £8,000, and the membership will be confined to the building and allied trades.

Kirkcaldy Building and Heritable Security Co., Ltd.—An extraordinary meeting of the shareholders was recently held in connection with the disappearance of the manager, David Thomson, solicitor, who disappeared on November 15th last, leaving a deficiency of £13,919 12s. 3d.—Mr. Alexander Balfour moved: "That it has been proved to the satisfaction of this meeting that the company cannot, by reason of its liabilities, continue its business, and that it is advisable to wind up the same, and accordingly that the company be wound up voluntarily." This motion, however, was not carried. The vote was as follows: For the motion, 1,026; against the motion, 95; declined to vote, 889.

New Buildings in Ayr.—An unusual number of buildings of a public or semi-public character are at present in course of erection or have just been completed at Ayr. Chief among these is the new town hall, which is being reconstructed on the old site from designs by Mr. J. K. Hunter, architect, Ayr, at a cost of about £10,000. A new theatre, the first real theatre that has ever been in Ayr, is being erected for a company on the site of a previous wooden structure, in Carrick Street, by Mr. J. M'Hardy Young, architect, Ayr, at a cost of more than £7,000. A new drill hall and headquarters for the 2nd Volunteer Battalion Royal Scots Fusiliers has been commenced at the south end of Alloway Street, from designs by Mr. James A. Morris, architect, Ayr. A block of buildings is being erected in High Street for the British Linen Banking Co. A large addition to the Ayr Corporation electric light and electric tramways station in Mill Street is nearing completion. A large new church is being built in Midton Road, to be known as Trinity United Free Church. The Glasgow & South-Western Railway Co. have in hand in the vicinity of Newton-on-Ayr Station the installation of a complete plant for the manufacture of oil-gas for the lighting of their railway carriages, to obviate the necessity of having to supply the light from Glasgow. The new iron railway bridge for the same company across the upper end of Ayr harbour is being finished. A large new shoe factory for Mr. Andrew Greenlees, Maybole, has been erected in the neighbourhood of Newton-on-Ayr Station, and is now in operation. In addition to these a large number of dwelling-houses, comprising villas and blocks of workmen's dwellings, are being erected in all parts of the town where there is vacant ground, and especially in the Craigie district.

Abbot Wakeman's Cenotaph in Tewkesbury Abbey.—The drawing of this cenotaph published in our issue for December 18th last was made by Mr. Benjamin Bower, architect and surveyor, of Birmingham.

Keystones.

Mr. Robert William Pollard, architect, of Brighton, died recently.

A Police Station in Ashley Road, Burmantofts, Leeds, is proposed to be erected.

A New Stained-Glass Window at Gorton Parish Church was dedicated recently. Mr. H. Gustave Hiller prepared the cartoons, and Mr. Reuben Bennett, of Old Trafford, erected the window.

Public Officials and Private Practice.—At a Council meeting of the Society of Architects held on December 19th last, it was unanimously resolved "that this Society is of opinion that it would be in the best interests of the public if architects, surveyors and engineers holding official appointments be debarred from private practice."

A Baptismal Font has been erected in the new United Free Church, Edzell, of a Caen stone basin and base, with a highly polished Connemara green marble shaft. The detail is delicate, and the work has been executed by Mr. James Bremner, sculptor, under the direction of Messrs. Thoms & Wilkie, architects, of Dundee.

New Board Schools at Balderton are about to be erected from plans by Messrs. Saunders & Saunders, Arcade Chambers, Newark, at an estimated cost of about £2,700. The materials are local bricks laid in blue lias lime mortar, relieved by simple stone dressings. Accommodation for 300 children, by six class-rooms of a capacity of fifty children each, will be provided.

A Hungarian National Monument.—The Hungarians are about to erect a colossal monument to the memory of Arpad, the founder of their kingdom. It will be placed on the top of the Banhida Mountain, and consists of a gigantic representation of the legendary bird of Hungary. The animal is in bronze, and costs £4,000, which was publicly subscribed. The sculptor was Donath Gyula.

A New Country-House at Murtle, N.B., is being erected for Mr. W. R. Freeman, of London. The design is Elizabethan in style. Mr. J. Coates Carter, F.R.I.B.A., Cardiff, is the architect; and the contractors are:—Mason work, Mr. John Morgan; carpenter work, Messrs. D. Macandrew & Co.; plumber work, Messrs. A. Lamb & Son; tiled work, Messrs. M'Gregor & Shand; plasterers, Messrs. Sellar & Co.; painters, Messrs. J. & S. Fyfe. The cost of the erection of the building is estimated to amount to about £6,000.

The Ancient Church of St. Michael, Manningtree, was reopened recently after renovation. The edifice dates from 1616, and much of the original oak used in the construction is still to be seen. In 1821 it was enlarged and repaired; in 1840 the present chancel was added. The old-fashioned high pews have now been replaced by modern kauri and red pine seats, painted dark red; a new floor with tiled aisles has been laid, and a new pulpit, lectern, choir stalls, chancel rails, &c., painted light green, have been introduced. The centre of the chancel and the altar have been raised. Incandescent gas-burners have been fitted. The organ has been overhauled; the roof has been repaired, and the whole building has been repainted and decorated. The cost of these extensive operations is £700. The contractors were Messrs. S. Parsons & Sons, of Manningtree, Messrs. W. Capon & Son carrying out the furnishing. Mr. J. Lucas, F.R.I.B.A., of Hitchin, was the architect.

St. Peter's Church, Bury, was opened recently after rebuilding. The church was originally built, at a cost of £4,800, thirty years ago. A few years ago, however, the structure began to show signs of insecurity, and ultimately it was deemed advisable to obtain the advice of an architect, and Mr. Medland Taylor, of Manchester, was consulted. As a result of his examination and report, it was decided to rebuild, and the contract was secured by Mr. Charles Brierley, of Fishpool, Bury. The cost of rebuilding has been nearly £6,000. Structurally the building is similar in outline to the original church, but the side walls are higher than the old ones; the windows have been raised so as to obviate the possibility of draught, the buttresses have been strengthened, the vestries enlarged, and a large porch on the west has been erected. For want of funds a spire has not yet been built.

A Rowton Lodging-House in Grove End Road is proposed to be erected.

Mr. Norman Shaw has, we understand, withdrawn—for the time being—his resignation from the Royal Academy, in deference to the wishes of the Council.

Mr. W. L. Kay has been appointed chief architectural assistant in the City Engineer's Department, Coventry, at a salary of £165 per annum.

A New Hall for Trinity Church.—A New Parochial Hall for Trinity Church, St. John's Wood, is being erected by Messrs. Sherwin & Son, of Boston, for £2,401. It will seat 325 people. Mr. Horace Field is the architect.

The "Little Palace" of Fine Arts in the Champs Elysées is henceforward to be known as the Palais des Beaux-Arts de la Ville de Paris, and a capable committee has been named to form a collection from the art works belonging to the city.

The Criterion Theatre.—A scheme has been approved both by the London County Council and Mr. Wyndham for rendering the Criterion Theatre a safer public resort. Property to be purchased on the Jermyn Street side will enable exits to be provided sufficient to give ample and direct means of egress to the streets.

A Reredos has just been erected in Kinlet Church, Shropshire, as a memorial to the late Major Charles Baldwyn Childe. It is richly carved in alabaster in harmony with the other tombs and monuments of this old county family. The work has been carried out by Mr. Bridgeman, of Lichfield, from the designs of Mr. Oldrid Scott.

An Old Norman Font that for eighty years has been lying neglected and desecrated in the North Riding Parish of Marske-by-the-Sea has been renovated and restored to its original purpose. The old church of St. Germain at Marske, dating from the twelfth century, was pulled down in 1820, and as no one seems to have thought that the font was worth preserving it found its way to a farmyard. Subsequently it was rescued and converted into a flower vase for the vicarage garden. That was a long time ago, and now it has been restored. The old font is square in form, with a column or pilaster at the angles, each face ornamented with bold carved work of Norman character. The font has been placed on a suitable base, adapted from that of a similar font in Northamptonshire.

The Decoration of the Blackpool Council Chamber has now been completed. It is in English Renaissance style. The coved ceiling is decorated in boldly-modelled plasterwork, and has been subjected to a very simple colour treatment. The walls are framed in with a high dado and pilasters in oak left unpolished in its natural colour. The wall-surfaces left uncovered by the oak have been formed into five panels, two of which are treated with conventional ornament and armorial bearings, while the remaining three spaces are decorated with fine pictures illustrating episodes in Lancashire history. The internal fittings are all in oak. The pictures were painted by Mr. J. R. Brown, the superintendent of the art department of Messrs. Goodall, Lamb & Heighway, Ltd., who carried out the work under the superintendence of Messrs. Potts, Son & Hennings, the architects of the building.

Manningtree Church has been reopened after renovation. The edifice dates from 1616, and much of the original oak used in the construction is still to be seen. In 1821 it was enlarged and repaired, in 1840 the present chancel was added, and now it has been brought more up to date. The old-fashioned high pews have been replaced by modern kauri and red pine seats, painted dark red; a new floor, with tiled aisles, has been laid; and a new pulpit, lectern, choir stalls, chancel rails, &c, painted light green, have been introduced; the centre of the chancel and the altar have been raised. Incandescent gas-burners have beed fitted. The organ has been overhauled; the roof has been repaired, and the whole building has been repainted and decorated. The cost of these extensive operations is £700. The contractors were Messrs. S. Parsons & Sons, of Manningtree; Messrs. Capon & Sons carrying out the furnishing. Mr. J. Lucas, F.R.I.B.A., of Hitchin, was the architect.

The New Cathedral at Westminster is to be opened on June 29th next—three days after the King's Coronation.

The Clones Rural District Council have appointed Mr. Thomas O'Brien, Swanlinbar, County Cavan, as architect and surveyor, in connection with the Council's scheme for the erection of thirty-nine labourers' cottages.

Mr. Alfred Waterhouse, R.A., it is announced, has retired from the presidency of the National Society for Checking the Abuses of Public Advertising—this, unfortunately, owing to ill-health.

The Pergamon Museum in Berlin, which was recently opened by the Kaiser, has cost £42,500, and contains a number of portions of Greek sculpture and architecture which once adorned the temple on the heights of Pergamon (erected between 197 and 159 B.C. to Zeus and Athene).

New Board Schools at Gravesend have been built from designs by Mr. S. I. Adams, of Southend. They provide accommodation for 520 boys and girls and 254 infants. Messrs. C. P. Kinwell, of Gravesend, installed the hot-water radiators and pipes, and Messrs. Adams the sanitary fittings. The amount of the contract for the schools and caretaker's house was £9,575.

Mr. John B. McDonald, R.S.A., died recently at the age of seventy-three. He was one of the McDonalds of Keppoch, and was born at Boharm, Morayshire. He received his early education in his native parish, and for a short time was attached to farm life. He developed a taste for art, and came to Edinburgh in 1852, where he attended the Board of Trustees' School of Art. Afterwards he studied under Robert Scott Lauder, and received several prizes from the Royal Scottish Academy.

The Bismarck Monument for Hamburg.—Two hundred and fifty German sculptors and architects have sent in models and designs for the proposed Bismarck monument at Hamburg. The museum at Hamburg was too small for the exhibition of all the designs, and they are accordingly placed for public view in the Velodrome. The city of Hamburg proposes to spend four hundred thousand marks on the monument, including thirty thousand marks for ten prizes, the distribution of which will be decided by the jury to-morrow.

The Steeple of Chesterfield Parish Church is often called the "corkscrew" steeple, for it has got quite a big twist. This is due to the action of the sun on the wooden and iron materials, and the warping is more pronounced in the case of Chesterfield Church than in any other church in the country. Barnstaple and Bristol, and one or two other places, have leaning steeples, but their tendency is decidedly to "lean" and not to "twist." The church at Chesterfield is the nearest rival in the United Kingdom to the leaning tower at Pisa.

New Board Schools at Northfleet have been erected on a site at the corner of Dover and Springfield Roads. The architect is Mr. S. I. Adams, of Southend; and Messrs. Multon & Wallis, of Gravesend, are the builders. The schools accommodate 520 boys and girls, and 254 infants, and are built of bricks. Inside are used hard wire-cut bricks, and faced with red bricks, with guaged arches and Monks Park stone dressings. The roof is covered with Perfecta plain tiles. The walls of class rooms have a cement dado, and are dinged above and distempered. The corridors have glazed brick dado with dinging above. The wood principals and purlins where seen, are stained green. The whole schools are heated by hot water radiators and, pipes, which were supplied and fixed by Messrs. C. P. Kinnell, of Southwark Street. The ventilation appliances were supplied by Messrs. Kite, of Euston Road. The sanitary fittings are supplied by Messrs. Adams, of Westminster. The cloakrooms are of Stuart's granolithic paving. The front entrance is of terrazzo, laid by Mr. Bennett, of Dashwood House, Broad Street. The furniture for the schools was made and fixed by Messrs. Bennett & Co., of Old Kent Road. The hat and cloak-hooks are the Schola, made and supplied by Messrs. Brookes & Co. The amount of the contract for the schools and caretaker's house was £9,575. The quantities were taken off by Mr. G. T. G. Wright, of Winchester Street.

At the Dundee Liberal Association Rooms a panel, executed by Mr. Stewart Carmichael, has been fixed on the wall of the billiard-room. It is intended to show the progress of Scottish liberty by typical figures selected from the history of the nation from early times to the present day.

Rubislaw Parish Church has been improved by the filling in of the apse windows, nine in number, with stained-glass, designed and manufactured by Mr. John Whyte, Aberdeen. The church is being further improved by the introduction of electric lighting—the gift of Mr. Harvey Hall.

Change of Address.—Mr. J. S. Gibson has removed his offices to 27A, Old Bond Street, London, W., where his practice will be carried on, together with that of Mr. William Wallace, under the designation of Messrs. Wallace & Gibson, architects.

Old Hampstead.—Part of the Well Walk, Hampstead, and "The Grove" are threatened with destruction by the London School Board. With regard to the latter, it is interesting to note that just across the road is Constable's first home in Hampstead, No. 2, Lower Terrace, the home also of Sir Gilbert Scott.

The Dorman Museum at Middlesbrough, which is to be built on the south side of the Park entrance, will be about 85ft. sq., with an entrance hall 15ft. sq. The height of the building will be 25ft., but a dome will surmount the entrance hall, and will rise to 56ft. Another dome will be placed over one of the side galleries.

A new Congregational Church at Bury Park, Luton, Beds, is to be erected. The designs of Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines have been accepted. The estimated cost is £3,590, inclusive of a tower. The seating accommodation is for 533 persons. The facings are of red bricks and dressings of bath stone.

Baptist Church and Schools, Blackhorse Road, Walthamstow.—The competitive designs for this church submitted by Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, 5, Clement's Inn, Strand, W.C., have been adopted The accommodation provided in church is 812 adults. The estimated cost, including tower, is £4,471.

Leeds and Yorkshire Architectural Society.—In the "Green Book" for the session 1901–2 it is stated that there has been a slight increase in the membership, which now totals 119. The Council observe that the competition for the Society's prizes was most meagre. There was no competition whatever for the silver medal or for the prizes for design and construction, only one competitor for the sketching prize, and only one for the essay prize. They trust that the competition will be much keener this year. The accounts of the Society show a balance in the bank, and petty cash, of £87 19s. 9½d.

The Glasgow Architectural Craftsmen's Society.—At the sixth meeting of the session held on Friday, 20th ult., two papers were read. In the first Mr. W. G. Peddie, clerk of works, spoke on "Wall and Floor Tiles." He described the historical development of the tile industry, and showed samples of old Dutch and Persian tiles. He exhibited samples of modern tiles in various stages of their manufacture, and discussed the terms: "self-coloured," "encaustic," "glazed," "vitrified" and "enamelled." In the second paper Mr. McKim dealt with "Substitutes for Tiles." He showed samples of and described ceramic mosaic, marble mosaic, Venetian terrazzo, opalite and crystopal and Marmot tiling.

Leeds Baths Competition.—Sixteen sets of competitive plans were sent in for the building of Corporation baths and a public free library in York Road, Leeds. The Baths and Library Committees have confirmed the award of the assessor, Mr. Leonard Stokes, F.R.I.B.A., giving the three premiums to Leeds architects, as follows: 1, £50, Mr. H. Ascough Chapman, A.R.I.B.A., East Parade; 2, £30, Mr. W. Bakewell, Park Square; 3, £15, Mr. Percy Robinson, Albion Street. The buildings will be two-storeyed, of brick with stone dressings, and will cost about £15,000. The baths will be in All Saints' Place. The swimming bath will be 75ft. by 30ft. Special features will consist of a Russian bath and provision for school children. The library is excellently planned, a new departure which will prove popular being a public lecture hall.

New Patents.

The following specifications were published on Saturday last, and are open to opposition until February 11th, 1902. The names in italics are those of the communicators of the inventions. A summary of the more important of them will be given next week.

1900.—22,014, DOULTON, water-supply valves. 22,113, ROSE, drain-cleansing and repairing machine. 22,245, GREEN, cranes, hoists, &c. 22,248, WADDELL, optical instruments for range-finding and other measuring and surveying purposes. 22,305, HADDAN (*Whiting*), sluice gates for waterways. 22,499, JARVIS, WADKIN & KING, glazing bars. 22,549, JACKSON & FEARNLEY, safety apparatus for hoists or lifts.

1901.— 801, RIGBY, kiln for Portland cement or lime. 1,692, ROOVERS, regulator for controlling gas supply to bath heaters. 2,276, LONG, locks. 2,499, WILKINSON, slabs for building. 4,063, LEGGE & CHILTON, door-bolts. 8,737, PEART & FOXON, double-acting saws. 11,890, MONK, reversible casement windows. 16,165, BROWNE, chimney top. 19,714, SMITH & SHEPHERD, door-holder. 19,715, SMITH & SHEPHERD, sash-fastener. 21,775, HADDAN (*Wallace*), valves. 21,965, THIBAUT, facing walls with enamelled sheet-metal.
